SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 9
MAY 1, 1974

W74-04301 -- W74-04850

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 9
MAY 1, 1974

W74-04301 -- W74-04850

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

Doc.
I 19.4/2:
7/9-12

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

HYDROLOGY OF THE CENTRAL ARCTIC RIVER BASINS OF ALASKA,
Alaska Univ., College. Inst. of Water Resources.
D. L. Kane, and R. F. Carlson.
Available from National Technical Information Service as PB-228 011 $3.75 in paper copy, $1.45 in microfiche. Report No. IWR-41, December, 1973. 51 p, 14 fig, 5 tab. OWRR A-031-ALAS(6).

Descriptors: Hydrology, Runoff, *Precipitation(Atmospheric), Evapotranspiration, *Arctic, *Alaska, Permafrost, *River basins, Snow, *Streamflow, Evaporation, Hydrologic data.

In 1969, a study of the water resources of Alaska's Arctic was initiated in response to the area's large scale petroleum exploration and extraction activities. A summary of the work is presented through a discussion of the basic features of the hydrologic system; the physical system, climatic input, and hydrologic output, with particular emphasis given to the Kuparuk, the Sagavanirktok, and the Putuligayuk Rivers. Precipitation acts as the controlling input function for the overall system. It occurs as snowfall in the eight winter months and as rainfall in June, July, August, and most of September. Comparison of precipitation records are made for Barrow, Barter Island and Prudhoe Bay. Other input variables which were examined are solar radiation, wind speed, and temperature. The output variables of the hydrologic system are evaporation and streamflow. Streamflow values collected by the U.S. Geological Survey for a two to three year period for the Putuligayuk, the Kuparuk, the Sagavanirktok Rivers indicate peak values and approximate summer mean values of 25, 20 and 20 cfs/mi2 and .01, 0.1, 1.0 cfs/mi2 respectively. The streamflow begins with a precipitous rise at the beginning of June and recedes to a sustained amount for the remainder of the summer until September after which the winter flow becomes nearly negligible. The most severe restriction on hydrologic studies in this and other arctic areas is the lack of long term data.

A DETAILED INVESTIGATION OF THE SOCIOLOGICAL, ECONOMIC, AND ECOLOGICAL ASPECTS OF PROPOSED RESERVOIR SITES IN THE SALT RIVER BASIN OF KENTUCKY,
Kentucky Water Resources Inst., Lexington.
S. E. Neff, L. A. Krumholz, J. R. Baker, D. E. Jennings, and A. C. Miller.
Available from National Technical Information Service as PB-227 920 $3.75 in paper copy, $1.45 in microfiche. Research Report No 67, 1973. 64 p, 2 fig, 6 tab, 18 ref. OWRR B-022-KY(1). 14-31-0001-3286.

Descriptors: *Kentucky, *Reservoir sites, *Pre-impoundment, *Benthos, Fish, *Aquatic habitats, Limnology, *Water quality, Environmental effects, Natural resources, Benefits, Planning, Population, *Social adjustment, Economics, Sulfates, Phosphates, Alkalinity, Hardness(Water), Turbidity, Specific conductivity, Mussels, Coddisflies, Drift.
Identifiers: *Salt River basin(Ky.).

Samples of water, bottom fauna, and fishes were collected from 66 stations in the Salt River and one of its principal tributaries, the Beech Fork and its tributary the Chaplin River, Kentucky. Precipitation ranged from 38.86 inches (1969) to 58.04 inches (1970), an increase of nearly 50 percent with marked fluctuations in discharge. Intensive comparisons of phosphates, sulfates, specific conductance, total alkalinity, total hardness, and turbidity showed the streams to be relatively clean and healthy. Nearly 300 different kinds of benthic organisms and other macroinvertebrates have been collected and identified from the basin. Detailed studies of caddisflies and stream drift are under way along with the development of computer programs for diversity indices of the various organisms. Twenty-eight species of bivalve mussels and representatives of six genera of snails have been collected including the Asiatic clam Corbicula mulleri. Among the vertebrates, 60 species of fishes have been collected and identified along with 22 amphibians and 21 reptiles. Nearly 150 species of birds have been identified in the area. An economic study of Spencer County revealed that there has been a decrease in the human population along with a general decline in the overall economic picture of the county as indicated by a retarded rate of growth in annual per capita income and a decline in total retail sales within the county over the past decade. The highway system in the county consists largely of Class 4,5, and 6 roads whic, because of the topography, are generally narrow, crooked, and hilly. (Grieves-Kentucky)

STATISTICAL ANALYSIS OF HYDROGRAPH CHARACTERISTICS FOR SMALL URBAN WATERSHEDS,
Tracor, Inc., Austin, Tex.
D. W. Hamm, C. W. Morgan, and H. A. Reeder.
Available from the National Technical Information Service as PB-228 131, $5.00 in paper copy, $1.45 in microfiche. Completion Report Document Number T73-AU-9559-U, October 1973. 155 p, 10 fig, 13 tab, 4 ref, 3 append. OWRR C-3286 (No 3737) (1).

Descriptors: *Unit hydrographs, *Synthetic hydrographs, *Rainfall-runoff relationships, Precipitation excess, Channel improvement, Peak discharge, Storm runoff, Equations, *Statistical models, Model studies, Regression analysis, Small watersheds, Watersheds(Basins).
Identifiers: *Urban watersheds, Confidence limits, Nomograms, Impervious cover, Time of rise, Correlation coefficient.

The purpose was to obtain equations which predict the 30-minute unit hydrograph for small urban watersheds. Equations were derived for models of the product form that correlate basin topographical features with hydrographic parameters. The models were transformed by natural logarithms so that linear regression methods could be used to obtain estimates of the exponents in the equations. The equations were applied to a wide variety of watersheds to demonstrate their validity. Confidence intervals were derived for the estimation of each hydrographic parameter. Nomograms were supplied to provide fast and accurate solutions for each equation.

LINEAR SYSTEMS TECHNIQUE APPLIED TO HYDROLOGIC DATA ANALYSIS AND INSTRUMENT EVALUATION: A CASE STUDY ON DATA FROM THE ALICE SPRINGS AREA,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research.
P. S. Eagleson, and M. J. Goodspeed.
Available from NTIS, Springfield, Va. 22151 PB-223 330 Price $5.25 printed copy; $1.45 microfiche. Technical Paper No 34, 1973. 60 p, 39 fig, 10 tab, 27 ref, append.

Descriptors: *Systems analysis, *Instrumentation, *Rainfall-runoff relationships, *Australia, Frequency analysis, Stream gages, Rain gages, Hydrograph analysis, Data collections, Network design, *Hydrologic data.
Identifiers: *Linear systems analysis, Spectral analysis.

Methods of linear systems analysis were applied to questions of instrumentation adequacy and rainfall-runoff relations for a network of experimental catchments in the Alice Springs area, Australia. The methods used are given in detail. Sufficient data are not yet available for more than tentative conclusions to be drawn regarding rainfall-runoff relations. It is concluded that the instrumentation is adequate in performance for the purpose intended. Applicability of the techniques to other situations is discussed. (Knapp-USGS)

TOPOLOGY OF RIVER SYSTEMS AND HYDROGRAPHIC INDICATOR STUDIES (TOPOLOGIYA RECHNYKH SISTEM I GIDROGRAFICHESKIYE INDIKATSIONNYYE ISSLEDOVANIYA),
I. N. Gartsman.
Vodnyye Resursy, No 3, p 109-124, 1973. 2 fig, 1 tab, 34 ref.

Descriptors: *Geomorphology, *Topography, *River systems, *Drainage systems, *Hydrography, Systems analysis, Statistical models, Equations.
Identifiers: *USSR.

Basing hydrography on a systems approach to a river network is an effective scientific method of study. The history of development of the systems approach under the impetus supplied by Horton is reviewed, and ways are indicated for further improvement of topological analysis of river systems through formulation of dynamic models. Emphasis is placed on the need for a separate study of the drainage and transport systems of a river network. (Josefson-USGS)

HYDROLOGIC INVESTIGATION AND DESIGN IN URBAN AREAS--A REVIEW,
Snowy Mountains Engineering Corp., Cooma (Australia).
A. P. Aitken.
Australian Water Resources Council Technical Paper No 5 1973. 79 p, 9 fig, 11 tab, 10 append. Research Project 71/21.

Descriptors: *Urban hydrology, *Australia, *Reviews, Research and development, Data collections, Rainfall-runoff relationships, Urban runoff, Urbanization, Gaging, Urban drainage, Rational formula.

Urban hydrologic practices and research in Australia, United States of America, France, and the United Kingdom are reviewed. It is recommended that a deterministic mathematical model for urban catchments in Australia be developed, that a program involving the collection and analysis of rainfall, runoff, and water quality data in Australian cities be implemented, and that an Australian urban hydrology manual be compiled. The Rational Formula is most commonly used for computing flood discharges in Australia, but the coefficient of runoff cannot be objectively determined for any locality because of lack of data. The Road Research Laboratory (RRL) Hydrograph Model has been used for some catchments but is unsuitable in many localities and has not been tested sufficiently in others. Only in the United Kingdom, where it appears the RRL Hydrograph Model has gained wide acceptance, has there been a significant departure from traditional methods. Deterministic mathematical models have been developed in the United States of America, and these models have already been applied to some urban catchments. Research is being carried out on development of better instruments for recording rainfall, discharge, and water quality. In addition, research into the effect of urbanization on the environment is sponsored. A significant amount of current research in urban hydrology in the United States is related to solving water pollution problems. (Knapp-USGS)

Descriptors: *Cloud physics, *Urban hydrology, *Missouri, *Climatology, *Weather modification, Climatic data, Atmosphere, Clouds, Storms, Synoptic analysis, Weather data, Precipitation(Atmospheric), Humidity, Rainfall.
Identifiers: Metromex studies, *St. Louis(Missouri).

Metromex is an investigation of inadvertent weather modifications resulting from an urban environment. Findings are summarized from analyses of data collected during the first two years of the 5 year field operation, located in St. Louis. Primary focus is climatological--statistical analyses of surface studies, including studies of seasonal and storm rainfall, synoptic storm types, thunderstorms, hail, surface raincells, measurements of condensation nuclei and raindrop distributions, wind, temperature, humidity, and urban effects on surface and groundwater quality. Results indicate that rain, thunderstorms, and hail maximize in both intensity and duration at locations 10 to 15 miles downwind of an urban-industrial region. Limited analyses of atmospheric studies are also included. One indicated effect of heat and other emissions generated by an urban area is the presence of higher cloud bases than those found in rural regions. (Hoffman-North Carolina)

ACCUMULATION ON THE DEVON ISLAND ICE CAP, NORTHWEST TERRITORIES, CANADA,
London School of Economics and Political Science (England).
R. M. Koerner.
Available from NTIS as AD-685 348 for $3.00 paper copy, $1.45 microfiche. Journal of Glaciology, Vol 6, No 45, p 383-392, October 1966. 6 fig, 1 tab, 4 ref.

Descriptors: *Canada, *Glaciers, Ice, *Winds.
Identifiers: *Ice caps, *Devon Island(Canada), Snow transport, Katabatic winds, Baffin Bay, Cyclonic activity, *Snow accumulation.

The pattern of accumulation on the Devon Island ice cap is described. There is an area of minimum accumulation encircling the highest part of the ice cap and 100-200 m below it. Below this zone, accumulation gradually increases to a maximum near the ice-cap edge. The overall pattern is related to snow transport by katabatic winds. There is a regional accumulation pattern of high accumulation (ca. 40.0 cm. water equivalent) in the south-east part of the ice cap and an area of low accumulation (ca. 11.0 cm. water equivalent) in the north-west. This east-south-east to west-north-west accumulation gradient is related to cyclonic activity to the east in Baffin Bay, and it is probably intensified by the presence of open water in the same area. PERMAFROST: NORTH AMERICAN CONTRIBUTION TO SECOND INTERNATIONAL CONFERENCE.
International Conference on Permafrost, 2nd, Yakutsk, USSR: 1973, National Academy of Sciences, Washington, D.C., 1973. 783 p.

Descriptors: *Permafrost, *North America, *Conferences, Frozen ground, Ice, Frozen soils, Engineering, Environment, Reviews, Design, Frost action, Subsidence, Freezing, Thawing, Cryology.

The scope of the second conference includes consideration of environmental, ecological, and resource development issues. Summary review papers cover the seven main conference topics. The topics are: thermal aspects; distribution; genesis, composition, and structures; physics, physical chemistry, and mechanics; groundwater; surveying and predicting; and engineering and construction. (See also W74-04347 thru W74-04423) (Knapp-USGS)
W74-04346

THERMAL CONDITIONS IN PERMAFROST--A REVIEW OF NORTH AMERICAN LITERATURE,
National Research Council of Canada, Ottawa (Ontario).
L. W. Gold, and A. H. Lachenbruch.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 3-25, 1973. 5 fig, 1 tab, 117 ref, append.

Descriptors: *Permafrost, *Reviews, *Temperature, *Heat flow, *Publications, Geothermal studies, Heat transfer, Heat budget, Frozen soils, Frozen ground.

Thermal conditions in permafrost are reviewed in two sections, the surface boundary condition and subsurface thermal conditions. In principle, the ground thermal regime can be determined for any time at a given location if the boundary conditions are specified. A particularly complex set of conditions exists at the surface where the earth is in contact with the atmosphere. At this boundary the temperature is continually changing in order to maintain a balance between heat lost or gained by radiation, evaporation, convection, conduction, and precipitation. The most satisfactory method of establishing this upper boundary condition appears to be by direct measurement of the temperature at some depth with respect to the surface. Superimposed on the effects of changes in surface temperature are those due to heat flow from the interior of the earth. Although this amount of heat is

small relative to the cyclical contributions at the surface, it has a significant influence on the temperature gradient at depths greater than that to which the annual temperature changes propagate and, therefore, on the thickness of permafrost. Temperature changes and their effects in porous ground are complicated by movement of the fluid and gaseous phases of water. Additional complicating effects are caused by the phase change that occurs in bulk water at 0 deg C and at lower temperatures for water under the influence of the surface of the solid. Good progress has been made in taking into account phase changes in ground temperature calculations and in understanding their effects on the ground thermal regime, but both the qualitative and quantitative understanding of the contribution and effects of water and vapor movement are still in a primitive state. (See also W74-04346) (Knapp-USGS)
W74-04347

INFLUENCE OF CLIMATIC AND TERRAIN FACTORS ON GROUND TEMPERATURES AT THREE LOCATIONS IN THE PERMAFROST REGION OF CANADA,
National Research Council of Canada, Ottawa (Ontario).
R. J. E. Brown.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 27-34, 1973. 10 fig, 1 tab, 5 ref.

Descriptors: *Permafrost, *Temperature, *Terrain, Frozen ground, Frozen soils, Freezing, Thawing, *Canada, Arctic, Data collections, Heat flow, Geothermal studies.

Regular periodic measurements (at least monthly) of ground temperatures are being taken at three locations in northern Canada to assess the influence of climatic and terrain factors on permafrost. These are Thompson, Manitoba, situated in the southern part of the discontinuous permafrost zone, Yellowknife, Northwest Territories, in the northern part of the discontinuous permafrost zone, and Devon Island, located in the Canadian Arctic Archipelago (Queen Elizabeth Islands) in the northern part of the continuous zone. Ground temperature measurements with thermocouple cables down to the 15-m depth in various types of terrain are being taken at these locations and analyzed to determine the range of mean annual ground temperatures that may exist at any one site in the permafrost region. Mean annual ground temperatures at depths down to 15 m may differ over a 2 deg C range among various types of terrain at any one location in the permafrost region. These variations are reflected in different depths of active layer that may range from less than 0.5 m to more than 2 m, even in the northern part of the continuous zone. Variations greater than 1 deg C may occur even between sites only a few tens of meters apart. These local differences can reflect significant differences in the extent and thickness of permafrost and the susceptibility to thawing. (See also W74-04346) (Knapp-USGS)
W74-04348

DEEP TEMPERATURE OBSERVATIONS IN THE CANADIAN NORTH,
Department of Energy, Mines and Resources, Ottawa (Ontario). Earth Physics Branch.
A. S. Judge.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 35-40, 1973. 3 fig, 22 ref.

Descriptors: *Permafrost, *Temperature, *Geothermal studies, *Canada, Arctic, Data collections, Wells, *Boreholes, Heat flow, Heat budget.

Boreholes of depths of 300 m or more are used for temperature observations at 22 locations in Canada within permafrost. In addition, multisensor cables were installed in 17 boreholes, varying in depth from 20 to 60 m. The thickest permafrost measured in Canada is 530 m at Winter Harbour on Melville Island, in a well only 1,000 m from the present shoreline. Thicknesses of 1,000 m should exist on the basis of known rock types, surface temperature distribution, and a postulated regional heat flow distribution based on values measured in southern Canada. Very thick permafrost is to be expected if low surface temperatures occur in the areas of exposed shield rocks, or of shield rocks beneath present icecaps, and in areas where the Arctic Platform is overlain by dolostones and quartz sandstones. Measured thicknesses in the arctic islands range from 275 to 530 m. A thickness of over 400 m was projected in northern Quebec based on temperatures to depths of 260 m and a thickness of 360 m measured on Richards Island in the Mackenzie Delta. Permafrost thicker than 300 m probably occurs extensively through the shield of northern Keewatin District, since surface temperatures are -10 deg C or lower. Some permafrost occurrences have been reported to the south of the present 0 deg C surface temperature isotherm. (See also W74-04346) (Knapp-USGS)
W74-04349

A GENERAL SOLUTION FOR THE TWO-DIMENSIONAL, TRANSIENT HEAT CONDUCTION PROBLEM IN PERMAFROST, USING IMPLICIT, FINITE DIFFERENCE METHODS,
Brown and Root, Inc., Houston, Tex.
R. M. Kliewer.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 41-51, 1973. 7 fig, 1 tab, 2 ref.

Descriptors: *Permafrost, *Heat flow, *Computer programs, Thawing, Freezing, Finite element analysis, Consolidation, Frost heaving, Subsidence, *Conduction, *Heat transfer.

A computer programming technique is presented for mathematically modeling a large class of problems involving the thermal response of a permafrost medium. Allowance was made for seasonal temperature variation at the surface and also for the addition of extraneous thermal disturbances. This permits prediction of the effect of thermal disturbances on the natural variation of temperature in the permafrost. There is a provision for handling a stratified permafrost medium having layers possessing different thermal properties. Consideration was also given to changes of thermal properties with freezing and thawing, and the latent heat of fusion was taken into account. (See also W74-04346) (Knapp-USGS)
W74-04350

THERMAL DISTURBANCE DUE TO CHANNEL SHIFTING, MACKENZIE DELTA, N.W.T., CANADA,
Carleton Univ., Ottawa (Ontario).
M. W. Smith, and C. T. Hwang.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 51-60, 1973. 6 fig, 2 tab, 16 ref.

Descriptors: *Permafrost, *Alluvial channels, *Thawing, *Freezing, *Heat flow, Mathematical models, *Canada, Finite element analysis.

The geomorphological pattern of permafrost distribution was studied under a shifting river channel and the process was analyzed quantitatively in the framework of heat conduction theory. At present, the Mackenzie river is cutting into a spruce-covered surface in excess of 300 years old (as indicated by tree cores) on the outside bends of meanders, with consequent degradation of permafrost. The talik, which exists beneath the river, follows the river migration. Also as the cut bank recedes, new deposits are formed on the slipoff slope, and, under the influence of low-mean annual surface temperatures, permafrost will form. The process of geomorphic change is accompanied by a vegetation succession that produces a complex interaction between topography, vegetation, microclimate, and ground temperatures. The calculated variations in permafrost distribution compare well with field measurements and, in a qualitative sense, with those reported in the literature. The finite element formulation of the heat conduction equation provides good temperature predictions and demonstrates the consistency of the ground temperature field in the framework of heat conduction theory. The use of a temperature wave to simulate the river migration yields satisfactory results. (See also W74-04346) (Knapp-USGS)

ECOLOGICAL EFFECTS OF RIVER FLOODING AND FOREST FIRES ON PERMAFROST IN THE TAIGA OF ALASKA,
Forest Service (USDA), College, Alaska. Inst. of Northern Forestry.
L. A. Viereck.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 60-67, 1973. 7 fig, 1 tab, 26 ref.

Descriptors: *Permafrost, *Freezing, *Thawing, Floods, Forest fires, Ice, Frozen ground, Vegetation effects, Silting, Ecology, *Alaska.
Identifiers: *Taiga(Alaska).

In the taiga of Alaska, permafrost and vegetation are closely related. In areas underlain by permafrost, the nature of the vegetation is important in determining the thickness of the active layer. In a black spruce stand, the active layer is normally 30-60 cm thick. Flooding has several effects on the vegetation-permafrost relationship on floodplain forest stand. Flooding and water table rise by warm water can quickly thaw existing permafrost or cause higher soil temperatures over at least the upper 150 cm of the substrate. Siltation during flooding results in the compaction and death of the moss layers, thus reducing their insulating value in summer which results in higher soil temperatures and an increase in thickness of the active layer. The results of thawing of frozen layers heavily laden with ice can be surface subsidence, tipping of trees, and eventually the formation of thaw ponds. In some cases, flooding over permafrost results in a separation of the organic layer at the permafrost boundary and a compression and rolling of the organic layer into peat mounds. Fire in forest types underlain by permafrost results in a temporary thickening of the active layer. For the first 15 years after fire, thaw is more than 1 m; return to preburn thaw levels takes about 50 years. (See also W74-04346) (Knapp-USGS)

DISTRIBUTION OF PERMAFROST IN NORTH AMERICA AND ITS RELATIONSHIP TO THE ENVIRONMENT: A REVIEW, 1963-1973,
National Research Council of Canada, Ottawa (Ontario).
R. J. E. Brown, and T. L. Pewe.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 71-100, 1973. 8 fig, 1 tab, 284 ref.

Descriptors: *Permafrost, *North America, *Reviews, *Bibliographies, Frozen soils, Frozen ground, Ice, Distribution patterns, Canada, United States, Alaska, Cryology, Publications.

This review summarizes progress since 1963 in knowledge of the distribution of permafrost and the relation of environmental factors in North America. The extent of the discontinuous and continuous permafrost zones in Canada has been generally determined during the past 10 years, although detailed local information is still sparse in all but a few areas. The general distribution of permafrost in Alaska was known prior to 1963, while investigations in Greenland were initiated at about that time. The relationship of permafrost distribution and occurrence to climatic and terrain factors has received much attention in the past decade,

resulting in steady improvement in the ability to predict permafrost conditions in areas not previously investigated. The general correlations are now known, but much refining remains to be done. Four significant features of the investigations in North America during the past 10 years, relating to distribution of permafrost and its relationship to the environment, are the awareness of submarine permafrost extending under the seas in northern coastal areas; the origin, distribution, and amount of ground ice, especially massive ice; the increasing interest in features denoting the distribution of permafrost in past geological periods; and the distribution of permafrost at high elevations in the mountainous areas of western Canada and the United States. A GEOECOLOGICAL TERRAIN ANALYSIS OF DISCONTINUOUSLY FROZEN GROUND IN THE UPPER MACKENZIE RIVER VALLEY, CANADA,
Department of the Environment, Edmonton (Alberta).
C. B. Crampton, and N. W. Rutter.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 101-105, 1973. 8 fig, 2 ref.

Descriptors: *Permafrost, *Surveys, *Aerial photography, *Terrain analysis, Geomorphology, Frozen ground, Ice, Frozen soils, Engineering, Arctic, *Canada.

Aerial photographs may be used for rapid identification of terrain types in terms of surficial geology, microrelief, and vegetation, which is significant regarding permafrost conditions. High forest is indicative of freely drained sites, such as alluvial terraces, fans, and glaciofluvial deposits, and sand dunes, which offer the best construction sites. Relatively featureless flats on aerial photographs, though often with local reticulate bogs, are indicative of seasonally waterlogged lands on lacustrine or till deposits that present the engineer with problems typical of permafrost-free areas. However, where the terrazoid pattern can be seen on aerial photographs, raised peat with near-surface permafrost and ground ice is intricately associated with pools, often without permafrost. These patterns are characteristic of lacustrine and till deposits that contain ground ice. On uplands, with characteristic till morphology, a deranged drainage pattern on flats, especially a subparallel drainage pattern on slopes delineated by lichen on raised parts and Sphagnum in drainage runnels, in indicative of a shallow permafrost table and ground ice. These areas are best avoided for most construction purposes. (See also W74-04346) (Knapp-USGS)
W74-04354

A SPATIAL CORRELATION BETWEEN PLANT DISTRIBUTION AND UNFROZEN GROUND WITHIN A REGION OF DISCONTINUOUS PERMAFROST,
Alberta Univ., Edmonton.
D. Gill.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 105-113, 1973. 9 fig, 8 ref.

Descriptors: *Permafrost, *Canada, *Arctic, *Vegetation effects, Frozen ground, Freezing, Thawing, Alluvial channels, Erosion, Geomorphology.

Some locations in the Mackenzie Delta are underlain by taliks, and hypotheses are given for their existence. There is a close areal relationship between the distribution of these taliks and the distribution of one discrete plant association. Taliks under youthful slipoff slopes in the Mackenzie Delta undergo spatial variations over time. The freezing isotherm should be prograding into the taliks from the adjacent large cells of permafrost such as that situated below the Salix-Alnus and Picea associations. The process of frost accretion is slow and probably parallels or lags behind the progradation of slipoff slopes, depending on the rate at which individual channel segments shift. Since permafrost is currently degrading along cut banks opposite such locations, it is clear that the formation and decay of perennially frozen ground in the Mackenzie Delta is a dynamic process that sees major areal displacements of permafrost bodies through time. W74-04355

INDIRECT MAPPING OF THE SNOWCOVER FOR PERMAFROST PREDICTION AT SCHEFFERVILLE, QUEBEC,
McGill Univ., Schefferville (Quebec). McGill Sub-Arctic Research Lab.
H. B. Granberg.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 113-120, 1973. 8 fig, 18 ref.

Descriptors: *Permafrost, *Snow cover, *Mapping, Mining, *Canada, *Aerial photography, Surveys.

Two different techniques of indirect mapping of the snowcover are useful in delineating permafrost in the Schefferville area of Quebec. A method based on sequence melt photographs is suitable for permafrost prediction on a regional scale, where only the surficial extent of permafrost is considered. Three to four flights, evenly spaced through the first 150 cm of snow depth decrease, are sufficient to obtain good information about the spatial variations in snow accumulation for the particular year. When there are appreciable regional differences in melt rates within the area photographed, additional snow measurements are required for calibration of the class limits. A computerized model was developed for more detailed work where the actual geometry of permafrost is important. A particular advantage of this model is its suitability for further modeling of the thermal effects of the snowcover and other topographically related factors. Empirical equations were determined for the influence of the seasonal snowcover on ground temperatures. (See also W74-04346) (Knapp-USGS)
W74-04356

PERMAFROST AND ITS RELATIONSHIP TO OTHER ENVIRONMENTAL PARAMETERS IN A MIDLATITUDE, HIGH-ALTITUDE SETTING, FRONT RANGE, COLORADO ROCKY MOUNTAINS,
Colorado Univ., Boulder.
J. D. Ives.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 121-125, 1973. 4 fig, 1 tab, 14 ref.

Descriptors: *Permafrost, *Colorado, *Alpine, Frozen ground, Frozen soils, Heat budget, *Rocky Mountain Region, Climatology.

Permafrost occurs throughout the Colorado Rocky Mountains. One of the most important environmental parameters in this high-altitude and relatively low-latitude region is incoming shortwave radiation and hence slope angle and aspect; another is the interrelationships of wind, snow distribution, and topography. At elevations of 3,500 m and above, immediately above treeline, patches of permafrost should be expected under wet sites that are largely blown free of snow during winter. Thickness of the active layer may be less than 2 m and freezeback to the permafrost table may not be complete until mid-February or early March. There will be no permafrost under dry sites, south-facing slopes, and snow-accumulation sites. The highest summits of the Front Range (4,000-4,400 m), with an extrapolated mean annual air temperature of about -9 deg C for 4,400 m, should be extensively underlain by permafrost of considerable thickness. The predominantly dry conditions and extensive areas of bedrock outcrop severely limit the accumulation of significant amounts of ground ice. Nevertheless, the possible presence of permafrost is sufficient to indicate that any mountain development should take it carefully into account. (See also W74-04346) (Knapp-USGS)
W74-04357

POSTGLACIAL PERMAFROST FEATURES IN EASTERN CANADA,
Laval Univ., Quebec.
D. Lagarec.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 126-131, 1973. 7 fig, 12 ref.

Descriptors: *Permafrost, *Paleoclimatology, *Canada, Geomorphology, Terrain analysis, *Aerial photography, Frozen ground, Frost action.
Identifiers: Quebec.

Circular mounds and flat-bottomed depressions observed in aerial photographs of northern Quebec were formed by postglacial permafrost. Other features include polygonal cracking of a uniform surface in blocks 10-20 m long, formation of flat-topped and steep-sided mounds by erosion along the cracks, and smoothing of mound slopes by sliding of side material. These observations in northern Quebec appear to corroborate those made in the Soviet Union and lead to the conclusion that in southern Quebec similar features were formed under similar conditions, namely discontinuous permafrost and cold humid climate with a mean annual air temperature of -2 to -4 deg C, meaning 5-7 deg C cooler than the present temperature. (See also W74-04346) (Knapp-USGS)
W74-04358

THE OCCURRENCE AND CHARACTERISTICS OF NEARSHORE PERMAFROST, NORTHERN ALASKA,
R. I. Lewellen.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 131-136, 1973. 3 fig, 2 tab, 7 ref.

Descriptors: *Permafrost, *Beaches, *Alaska, *Beach erosion, Water temperature, Frozen ground, Barrier islands, Sedimentation.
Identifiers: Undersea permafrost.

Permafrost is known to occur under the coastal waters of the Chukchi and Beaufort seas north of Alaska. Sea level, at or near the present level for the past years, can simulate eustatic change by the thermal erosion of the coastline. Rates of erosion ranging from 10 to 30 m per year, although operational only for the brief open-water period, can account for shoreline changes of 5-15 km in just 500 years in the Beaufort Sea region. With mean annual bottom water temperatures below -1.0 deg C, there are expected to be considerable expanses of offshore permafrost. As the seawaters transgress the coast, the bottom elevations move farther below sea level with distance away from the shoreline. This is transgression by thermal erosion or truncation without a tectonic or eustatic change. The change in bottom elevation is due, in part, to thaw subsidence and consolidation. On parts of these thermally truncated or thermal planation benches, storm waves and weak currents and tides winnow and scour fine material. As the sea thermally truncates the land, modifications to the existing permafrost, at or below the level of truncation, are in the form of mean annual surface temperature change and the possible circulation of seawater in the new seasonal thaw layer. In general, a warmer but still negative mean annual temperature prevails after the shoreline passes. If the sea level has been oscillating only 1-3 m around the present level for the past 3,000 or 4,000 years, and if allowances are made for changes in coastal erosion rates, extensive areas of truncated permafrost must still exist under the Beaufort Sea floor. GEOPHYSICAL IDENTIFICATION OF FROZEN AND UNFROZEN GROUND, ANTARCTICA,
Northern Illinois Univ., De Kalb.
L. D. McGinnis, K. Nakao, and C. C. Clark.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973, p 136-146, 1973. 9 fig, 3 tab, 21 ref.

Descriptors: *Permafrost, *Antarctic, *Geophysics, *Resistivity, *Seismic studies, Electrical studies, Frozen ground, Salinity.

Geophysical measurements in the dry valleys of Antarctica reveal abnormally thin permafrost with respect to the present climate. Presuming a normal continental geothermal gradient of about 18 deg C/km, permafrost thicknesses should be on the order of 1 km. From laboratory studies, field observations, and theoretical analyses, it is inferred that the lack of development of thick confining permafrost is due to the presence of solar-heated lakes, which were much more extensive in the recent past, and to high water and soil salinities. Even where permafrost soil temperatures are present, the high soil salinities depress the freezing point to such a degree that the permafrost remains unfrozen in some locations and permits the movement of pore fluids. Beginning with Taylor Glacier in western Taylor Valley and extending eastward to the coast, all geophysical studies conducted indicate a layer of thin permafrost overlying unfrozen sediment. Along the tongue of Taylor Glacier, confining permafrost extends to depths greater than the maximum depth of exploration (150 m). East of Lake Bonney, confining permafrost is 20-30 m thick but is underlain by saturated, unfrozen sediment. In Wright Valley, thin permafrost or a lack of permafrost altogether, may extend from Don Juan and Don Quixote ponds in the west to eastern Lake Vanda. Thick permafrost is associated with thin sediment cover east of the lake; however, electrical measurements indicate that thin permafrost again prevails in the vicinity of Bull Pass. Victoria Valley and Lake Vida are underlain by thick and extensive permafrost. A thin layer of entrapped brine or low resistivity soil may rest on the bottom of Lake Vida as suggested by a long Schlumberger resistivity station. (See also W74-04346) (Knapp-USGS)
W74-04360

PERMAFROST CONSIDERATIONS IN LAND USE PLANNING MANAGEMENT,
Bureau of Land Management, Anchorage, Alaska.
C. V. McVee.
In: International Conference on Permafrost 2 nd, Yukutsk, USSR, 1973. p 146-151, 1973. 5 fig, 6 ref.

Descriptors: *Land use, *Permafrost, *Land management, Subsidence, Erosion, Conservation, *Arctic.

Permafrost is a dominant factor that must be considered by the land manager in the Arctic. Conventional resource utilization and extraction techniques must be modified to compensate for this physical phenomenon. Prior to implementing resource utilization and extraction activities, the land manager must be aware of the eventual implications of any proposed decision and its impact on future productivity and use of each finite commodity. Even a minor surface disturbance may alter the thermal balance sufficiently to induce permafrost thawing, which may result in subsidence or soil erosion or both, and affect such features as surface relief, access, siltation, and wildlife habitat. Changes in surface relief, such as depressions from subsidence or gullies from erosion by waters of melting soil ice interfere with subsequent construction or land travel. Eroding soil solids become deposited at some lower points in the watershed or drainageway, which further limit utilization of the land. Also, siltation may adversely affect water quality and the aquatic biota. (See also W74-04346) (Knapp-USGS)

PERMAFROST AND SNOWCOVER RELATIONSHIPS NEAR SCHEFFERVILLE,
McGill Univ., Schefferville (Quebec). McGill Sub-Arctic Research Lab.
F. H. Nicholson, and H. B. Granberg.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 151-158, 1973. 7 fig, 3 tab, 12 ref.

Descriptors: *Permafrost, *Snow cover, Frozen ground, Ice, Snow, *Canada, Temperature, Regression analysis, Groundwater, Snowpacks, Aerial photography, Mapping.

Snow is the most important factor controlling permafrost distribution in the Schefferville area of Quebec, and there is a linear relationship between ground temperatures and snow depth. Groundwater is an important subsidiary factor. The temperature at any depth correlates best with a snow area that has a radius two times that depth. A regression equation was calculated for combinations of temperature depth and snow radius that gave the highest correlation coefficients. This equation accurately predicts presence or absence of permafrost for 82% of a sample of 123 points, and the explanation is increased to 94% if points known to be affected by groundwater are removed. The depth of snow corresponding to a ground temperature of 0 deg C was 75 cm. (See also W74-04346) (Knapp-USGS)
W74-04362

STUDIES AT THE TIMMINS 4 PERMAFROST EXPERIMENTAL SITE,
McGill Univ., Schefferville (Quebec). McGill Sub-Artic Research Lab.
F. H. Nicholson, and B. G. Thom.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 159-166, 1973. 5 fig, 1 tab, 14 ref.

Descriptors: *Permafrost, *Snow cover, *Frozen ground, Ice, Snow, *Canada, Temperature, Regression analysis, Groundwater, Snowpacks, Mapping, Geophysics, Borehole geophysics, Resistivity.
Identifiers: Schefferville(Quebec).

Snow is the most important factor controlling the distribution of the permafrost in the Schefferville area of Quebec. The active layer is normally 3-4 m thick. Several examples of active layers up to 10 m deep are found, and this greater depth of thaw is due to shallow groundwater movement. The thermal diffusivity of the ground is often very high, as evidenced by the penetration of annual temperature waves as deep as 25-30 m. Moisture contents of the frozen ground range between 3 and 40% by volume and are commonly on the order of 15%. Sharp change in physical properties of the rocks, due to the change from frozen to unfrozen state, occurs at 0 deg C. The three-dimensional pattern of the mean isotherms and the relationships between snow and ground temperatures demonstrate that lateral heat flow is particularly important. It is postulated that the present permafrost distribution in upland sites is in equilibrium with contemporary environmental conditions and that relict permafrost is not extensive. W74-04363

GEOCHEMISTRY OF PERMAFROST AND QUATERNARY STRATIGRAPHY,
Arizona State Univ., Tempe.
T. L. Pewe, and P. V. Sellmann.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 166-170, 1973. 2 fig, 1 tab, 27 ref.

Descriptors: *Permafrost, *Geochemistry, *Stratigraphy, Glacial drift, Quaternary epoch, Soils, Frozen soils, Frozen ground, Resistivity, Salinity, *Alaska.
Identifiers: *Fairbanks(Alas).

A new approach to the study of permafrost is the chemical investigation of its ice and sediments. The existing ionic concentration gradients and their lateral dimensions can be indicative of cold regions environments and provide a measure of conditions prior to the formation of the perennially frozen ground. The distribution of soluble and exchangeable ions in soils, perennially frozen ground, and sediments underlying water bodies is influenced by both the materials and the present and past depositional and leaching environments. For the same material and environments, low concentrations indicate considerable leaching or freshening and high concentrations indicate lack of these active processes or enrichment by ground or surface waters. Silts and clays retain more soluble and exchangeable ions than do sand and gravels. Ionic concentration generally increases with depth, particularly in uplifted marine sediments. In the Fairbanks area, an abrupt change in chemical concentrations of extractable cations in permafrost shows a stratigraphic unconformity in retransported sediments of Wisconsinan age. Preliminary interpretations suggest thawing and refreezing above the unconformity. (See also W74-04346) (Knapp-USGS)

STRATIGRAPHY AND DIAGENESIS OF PERENNIALLY FROZEN SEDIMENTS IN THE BARROW, ALASKA, REGION,
Cold Regions Research and Engineering Lab., Hanover, N.H.
P. V. Sellmann, and J. Brown.
In: International Conference on Permafrost 2nd, Yukutsk, USSR, 1973. p 171-181, 1973. 5 fig, 5 tab, 36 ref.

Descriptors: *Stratigraphy, *Permafrost, *Alaska, Soil formation, Diagenesis, Sedimentation, Sedimentology, Intertidal areas.
Identifiers: *Barrow(Alaska).

The late Quaternary history of the northern Alaskan Arctic Coastal Plain is discussed. The last major marine transgression deposited the Barrow unit in mid-Wisconsinan time. Recession, uplift, and formation of near-surface permafrost followed. The last 10,000 years is characterized by a gradual warming, active thaw-lake formation and degradation, and burial of surface peats through cryopedologic processes. (See also W74-04346) (Knapp-USGS)
W74-04365

ORIGIN, COMPOSITION, AND STRUCTURE OF PERENNIALLY FROZEN GROUND AND GROUND ICE: A REVIEW,
British Columbia Univ., Vancouver.
J. R. Mackay, and R. F. Black.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 185-192, 1973. 82 ref.

Descriptors: *Permafrost, *Frozen ground, *Reviews, Ice, Frozen soils, Arctic, Quaternary period, Freezing, Thawing, Glaciation, Paleoclimatology.

The origin of perennially frozen ground (permafrost) and ground ice on land in North America and beneath the sea floor of the Arctic Ocean reflects the geomorphic processes and the thermal variations of the late Quaternary period. Many review papers and books have been published on perennially frozen ground and ground ice since the First International Conference on Permafrost in 1963. This review emphasizes massive ground ice in a brief summary of the state of knowledge of the origin, composition, and structure of permafrost. Deficiencies of

knowledge are pointed out, and some recommendations for future study are made. (See also W74-04346) (knapp-USGS)
W74-04366

GROWTH OF PATTERNED GROUND IN VICTORIA LAND, ANTARCTICA,
Connecticut Univ., Storrs.
R. F. Black.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 193-203, 1973. 1 fig, 16 tab, 9 ref.

Descriptors: *Antarctic, *Permafrost, *Geomorphology, Ice, Frozen soils, Frozen ground, Freezing, Thawing.
Identifiers: *Patterned ground, *Ice wedges, *Antarctica(Victoria Land).

Growth of patterned ground at 14 sites in Victoria Land, Antarctica was measured over an interval of 6-8 years from 1961 to 1969. In Victoria Land, patterned ground consists of sand-wedge polygons in the inland areas and of ice-wedge polygons along the more humid coasts. These represent the end members of a continuum in which the ice content of the wedges ranges almost from 0% to 100%. Composite wedges, representing mixtures of ice, sand, and rubble, are most abundant and widespread. Surface patterns reflect growth stages from narrow sharp cracks corresponding to the initial wedges through shallow rounded depressions over each wedge to wider and deeper depressions with raised rims on each side and, finally, in some places only to an irregularly mounded or pimpled surface where the mounds represent the centers of former polygons. Polygons commonly vary from 5 to 40 m in diameter. Most of the patterned ground in Victoria Land is young, dating within the last 5,000 years (even with thermal corrections to be applied). Multicyclic wedges are recognized by the wedge-in-wedge structure, and ancient patterned ground is being exhumed today to start growing again. (See also W74-04346) (Knapp-USGS)
W74-04367

THERMOKARST DEVELOPMENT, BANKS ISLAND, WESTERN CANADIAN ARCTIC,
Ottawa Univ. (Ontario).
H. M. French, and P. Egginton.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 203-212, 1973. 9 fig, 4 tab, 41 ref.

Descriptors: *Permafrost, *Melting, *Frozen ground, *Ice, *Erosion, *Canada, Soils, Frozen soils, Land subsidence, Subsidence, Soil erosion, Karst.
Identifiers: *Thermokarst.

Some thermokarst landforms and processes are to be found on Banks Island, in the western Canadian Arctic. This island, the fourth largest in the Canadian Arctic Archipelago, lies between 71 and 75 deg N and is totally within the zone of continuous permafrost. The importance of naturally occurring thermokarst is restricted to those areas where lithological and/or soil conditions favor a high ice content, or where massive ground ice is present. The close connection that exists between thermal erosion and thermal melting is most dramatically illustrated in localized areas of badland topography that exist in close juxtaposition to well developed polygon terrain and ice-wedge junction ponds. Certain types of thermokarst such as ground ice slumping, are some of the most rapid erosional processes operating in the high Arctic at present. (See also W74-04346) (Knapp-USGS)
W74-04368

PROBLEMS IN THE ORIGIN OF MASSIVE ICY BEDS, WESTERN ARCTIC, CANADA,
British Columbia Univ., Vancouver.
J. R. Mackay.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 223-228, 1973. 6 fig, 16 ref.

Descriptors: *Ice, *Permafrost, *Arctic, *Groundwater, *Canada, Frozen ground, Aquifers, Freezing.

Massive icy beds are of widespread occurrence in the western Canadian Arctic. Natural exposures may be seen along steep coastal bluffs, river banks, lake shores, and on hill tops where disturbances have induced thawing. The prior existance of massive icy beds can also be inferred in old slump scars. The massive icy beds show every conceivable gradation from icy muds to pure ice. Most of the icy beds have grown in situ, even though some buried glacier ice may be present. The widespread occurrence of massive icy beds above, or in close association with, sands and gravels suggest that these sediments served two purposes: a water source from water expulsion resulting from freezing of adjacent coarse-grained sediments and an aquifer. Massive bodies of segregated ice grow at depth in the same manner as that of segregated ice in pingos. (See also W74-04346) (Knapp-USGS)

A SIMULATION SENSITIVITY ANALYSIS OF THE NEEDLE ICE GROWTH ENVIRONMENT,
Michigan Univ., Ann Arbor.
ys. i. outcalt.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 228-234, 1973. 5 fig, 3 tab, 9 ref.

Descriptors: *Frost, *Frost action, Simulation analysis, Alpine, Frost protection, Frost prevention, Freezing, Thawing, Mathematical models.
Identifiers: *Needle ice.

Simulation of needle ice behavior provides the basic analytical framework for the simulation of the tundra active layer. Needle ice is the result of diurnal ice segregation near the soil surface. Ice segregation results from the increase in the water fraction of a soil layer produced by the upward migration of soil water to the freezing plane after nucleation occurs and the freezing place remains at a fixed level in an initially unfrozen soil. The process of needle ice erosion produces downslope soil movement in periglacial alpine terrain and is responsible for damage to plant materials when freezing causes vertical mechanical stress within the root zone. Needle ice damage may be attenuated by artificially mulching seedbeds with plastic sheeting or porous sand layers (10 mm thick) to reduce the surface wetness, artificially introducing roughness elements into the seedbeds, and avoiding extremely shadowed and wet natural sites. The strategies may be of extreme importance in repairing tundra and alpine meadow cover damage in alpine recreation areas. Deterministic models are capable of mimicking natural phenomena not specifically woven into the fabric of the model structure. As the general equilibrium temperature alogorithm is spatially and temporally unconstrained dimensionally, this system of equations, when modified to include specific process information, should be applicable to the entire spectrum of periglacial phenomena. PHYSICS, CHEMISTRY, AND MECHANICS OF FROZEN GROUND: A REVIEW,
Cold Regions Research and Engineering Lab., Hanover, N.H.
D. M. Anderson, and N. R. Morgenstern.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 257-288, 1973. 11 fig, 182 ref.

Descriptors: *Frozen ground, *Frost action, *Freezing, *Thawing, *Permafrost, Thermodynamics, Mass wasting, Solifluction, Soil water, Soil moisture, Water chemistry, Soil chemistry, Frozen soils, Soil physics.

Phase equilibria, thermal aspects, and physicomechanical aspects of frozen ground are reviewed. Much of the subject matter pertaining to the physics and chemistry of frozen ground derives from the nature and phenomenology of the interfaces present. The interfaces are of the following types: ice-ice (grain boundary), ice-water-air, silicate-water-silicate (primarily interlamellar), and silicate-water-ice (extralamellar). This terminology implies that, in contrast to the ice-ice interface, all the others possess a component with liquid-like characteristics. In general, water movement in frozen soil is analogous to flow in unfrozen soils, but flow is confined primarily to the unfrozen interface, and there is little or no contribution of vapor transport. Because ions and solutes tend to be rejected from the growing ice lattice, they are excluded to and confined to the domains of the unfrozen interfacial water. The mechanism of frost heaving has been the subject of many investigations. Briefly, as heat is extracted from above and freezing is initiated, growing ice crystals coalesce into planar ice lenses. The ice lenses are enlarged by the addition of water transported from the reservoirs of soil water below. Ice-lens growth occurs at locations where the temperature is favorable and the rate of appearance and dissipation of the latent heat of freezing does not exceed the flux of soil water. When the thermal regime of permafrost is changed as a result of engineering operations, or because of a perturbation of the local environmental conditions, the ice-water phase composition of the frozen soils also must change. The influence of this change on the stability and function of an engineering installation can be considerable. A convenient equation is given for predicting the apparent specific heat capacity and the cumulative heat absorption versus temperature curve of frozen soils from their water-ice phase composition data. The availability of this equation facilitates the calculation of thaw and frost penetration. An equation for the apparent specific heat capacity of frozen ground incorporating the relationship expressed in the first of these is derived. Apparent specific heat capacities are calculated as a function of temperature for six representative soils at each of three water contents. In addition, representative curves that depict the cumulative heat absorbed in bringing each from -10 deg C through the melting point were

computed and are given in graphical form. (See also W74e04346) (Knapp-USGS)

MECHANICAL PROPERTIES OF FROZEN GROUND UNDER HIGH PRESSURE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
E. Chamberlain.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 295-305, 1973. 11 fig, 2 tab, 8 ref.

Descriptors: *Soil mechanics, *Permafrost, *Seismic studies, *Compressibility, *Frozen soils, Frozen ground, Ice, Cryology, Craters, Rock mechanics, Soil physical properties, Soil physics, Mechanical properties.

The evaluation of crater and crater formation and seismic waves in regions of permafrost requires considerable knowledge of the high pressure behavior of frozen soil and ice. The compressibility of saturated frozen soil to 30 kbar is readily predicted from knowledge of properties, such as degree of saturation with ice, porosity, and the compressibilities of ice and mineral components. The accuracy is limited at low pressures and low degrees of saturation. The behavior of the phase transformations is somewhat obscured by rate processes and the reordering and crushing of the mineral particles. Confining pressure has great influence on the shear strength of frozen soils. At a temperature of -10 deg C and a strain rate of approximately 6 percent/min, three distinct stress regions are observed: a low-pressure region of constant or increasing shear stress, a mid-pressure region of decreasing shear stress, and a high-pressure region of slightly increasing shear stress. It is suggested that four elements--interparticle friction and particle interlocking, unfrozen water content, pressure melting of ice, and the ice-water phase change--control the triaxial compression behavior of saturated frozen soils. EFFECT OF POROSITY ON AMOUNT OF SOIL WATER TRANSFERRED IN A FREEZING SILT,
Rutgers - The State Univ., New Brunswick, N.J.
A. R. Jumikis.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 305-310, 1973. 4 fig, 2 tab, 6 ref.

Descriptors: *Frozen ground, *Groundwater movement, *Porosity, *Freezing, *Thawing, Mass transfer, Pores, Water vapor, Thermodynamics, Soil moisture, Water chemistry, Pore water, Ice, *Soil water.

The effects of porosity of a silty glacial outwash frost-prone soil on the amount of soil moisture transferred from groundwater to the cold front (0 deg C isotherm) upon freezing were studied. The porosity is the primary factor controlling the amounts of heat flow, moisture transfer, and all the related phenomena, as clearly demonstrated by the similar trends of all the related factors plotted together as a function of porosity. Depending on the magnitude of the porosity of the soil, moisture may be transferred upward from groundwater to the cold front by way of various moisture transfer mechanisms. The effective soil moisture transfer mechanism is by way of the water-film flow (unsaturated flow) within the porosity range between 27.8% and 47.8%. The moisture transfer by the film-flow mechanism is virtually unaccompanied by vapor diffusion. Between porosities of 60% and 100%, the effective soil moisture transfer mechanism is vapor diffusion. The vapor transport mechanism, however, is an ineffective one. (See also W74-04346) (Knapp-USGS)

EVALUATION OF IN SITU CREEP PROPERTIES OF FROZEN SOILS WITH THE PRESSUREMETER,
Ecole Polytechnique, Montreal (Quebec).
B. Landanyi, and G. H. Johnston.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 310-318, 1973. 6 fig, 9 ref.

Descriptors: *Permafrost, *Creep, *Rheology, *Instrumentation, *Borehole geophysics, Stress, Strain, Frozen soils, Soil strength, Soil mechanics, Soil physical properties, Ice.

The Menard pressuremeter is a borehole dilatometer for in situ measurement of stress-strain and strength properties of soils and rocks. It consists of an inflatable probe, composed of two coaxial cells, and a pressure-volume control device that allows a given pressure to be applied to the wall of the borehole and the resulting volume increase of the hole to be observed. After some minor modifications, the standard pressuremeter equipment proved to be suitable for performing creep tests in permafrost. The method proved feasible for the determination of creep parameters of frozen soils in situ and the prediction of long-term strength. To obtain sufficient creep information for the proposed method to be applicable, however, it is recommended that, in addition to conventional short-term pressuremeter tests, the following two types of creep tests be performed: multistage creep tests with about 15 min per stage, and one-stage creep tests conducted at different pressure levels to check the linearity of creep lines for long-time intervals. W74-04377

SHOCK-WAVE STUDIES OF ICE AND TWO FROZEN SOILS,
California Univ., Livermore.
D. B. Larson, G. D. Bearson, and J. R. Taylor.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 318-325, 1973. 15 fig, 1 tab, 8 ref.

Descriptors: *Frozen soils, *Soil physical properties, *Cryology, Thermodynamics, Soil physics, Strength of materials, Compressibility.
Identifiers: *Shock waves.

Shock-wave experimental techniques used in conjunction with one-dimensional numerical simulation models represent a useful technique for determining high-strain-rate equations of state in studying frozen materials and provide a unique examination of the compressibilities of this important group of materials. The Ice I-water phase transformation occurs during shock-wave loading both in pure ice and in the interstitial ice in saturated frozen soils. However, the observed final loading states are all in the mixed-phase region, and unloading data imply a continuation of the transformation during the initial part of this unloading. This unloading behavior creates a large energy sink whenever decaying shock waves propagate at stress levels above 2 kbar and to at least 15 kbar and also may occur at stress levels above this range. The relatively rapid attenuation of the shock wave in frozen materials is directly related to this loss of energy. Numerical simulation models that duplicate this rate of attenuation are also consistent with the loading and unloading observed in the uniaxial compression experiments. The differences between ice and frozen soil are a direct result of a larger area between the loading and unloading paths in the soils. Reasons for this difference are a slower transformation rate upon loading, followed by relatively rapid transformation in the initial unloading or limited transformation back to Ice I after the material unloads. Temperatures behind the shock and rarefaction waves could play an important part in the reverse transformations by stabilizing part or all of the water phase. (See also W74-04346) (Knapp-USGS)
W74-04378

THAW CONSOLIDATION OF ALASKAN SILTS AND GRANULAR SOILS,
Woodward-Lundgren and Associates, Oakland, Calif.
U. Luscher, and S. S. Afifi.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 325-334, 1973. 8 fig, 11 ref.

Descriptors: *Thawing, *Consolidation, *Subsidence, *Frozen soils, *Permafrost, Soil tests, Ice, Soil mechanics, Soil physical properties, *Silts.

An extensive investigation was made of thaw consolidation behavior of undisturbed frozen silts and granular soils from Alaska. Frozen silt samples were thawed and consolidated one-dimensionally with a range of vertical pressure from 12 to 384 kN/sq m using standard consolidation test equipment; these tests involved thawing with different pressures, as well as thawing with a single pressure and consolidating further with additional pressures. Frozen silt-sand samples were thawed and consolidated by two methods--one-dimensionally in the standard odometer test and anisotropically in the standard triaxial test with vertical-to-horizontal pressure ratios of 2 and 3, thus minimizing the changes in sample cross section during thawing and consolidation. Anisotropic thaw consolidation tests were made on dirty gravels and on clean sands and gravels. Uniaxial (one-dimensional) thaw strains can be estimated from triaxial thaw consolidation, which is the usual initial step in a consolidated, undrained strength test. The same result is true for silt-sands. (See also W74-04346) (Knapp-USGS)
W74-04379

MECHANICAL PROPERTIES OF ROCKS AT LOW TEMPERATURES,
Cold Regions Research and Engineering Lab., Hanover, N.H.
M. Mellor.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 334-344, 1973. 7 fig, 3 tab, 20 ref.

Descriptors: Permafrost, *Frozen ground, *Rock mechanics, *Strength of materials, Mechanical properties, Freezing, Moisture content, Rock properties, Strength.

Rock becomes significantly stronger when it freezes. Pore water in typical rock freezes progressively, and for each rock type there is a characteristic relation between unfrozen water content and temperature which depends to a large degree on surface area. Some water, corresponding closely to the maximum adsorbed water content, remains unfrozen at temperatures of -10 deg C and lower. Thickness, continuity and mobility of interfacial water decrease with decreasing temperature down to approximately -125 deg C. Rapid initial freezing of pore water in saturated rock can cause abrupt volumetric expansion of the rock, with strains that approach the tensile failure strain. After initial freezing of pore water, the residual unfrozen water is free to migrate under potential gradients, but it will freeze and (and expand) if it migrates into large cracks or cavities. Under high hydrostatic pressure, ice contained in pores will undergo phase transformation to polymorphs of higher density. If the ice content is high, this will produce significant strain discontinuities in the compressibility curve. Low-temperature strength is affected significantly by freezing, or ordering, of adsorbed water. In tests at 23 deg C, oven-dry rock is 35-40% stronger than air-dry rock containing maximum adsorbed water; when air-dry rock with maximum adsorbed water is cooled, strength below-70 deg is 35-40% higher than strength at 23 deg C. (See also W74-04346) (Knapp-USGS)

SOIL FREEZING IN RELATION TO PORE WATER PRESSURE AND TEMPERATURE,
Cornell Univ., Ithaca, N.Y.
R. D. Miller.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 344-352, 1973. 10 fig, 1 tab, 7 ref.

Descriptors: *Permafrost, *Frozen soils, *Freezing, Crystal growth, Mass transfer, Soil water movement, Permafrost, Thermodynamics, Cryology, *Pore water, *Pore pressure.

In studies of saturated soil, an ice-water interface behaved in a manner analogous to the behavior of an air-water interface in the same soil. A quantitative analysis of freezing of an unsaturated soil of very simple geometry was undertaken in order to establish a vision of the stages of progressive freezing in real soils of complex geometry. It provides a detailed rationale for the fact that, when moist soil freezes, profound changes in the water content occur: Water moves from unfrozen to frozen soil, whereby the pores of the frozen zones become saturated and adjacent ice-free soil is dessicated. Under the circumstances of interest, an adsorbed film of mobile water covers the surface of a mineral particle. This film exists between the mineral particle and air or ice with which the particle is in contact. The film will be thin, of the order of tens of angstrom units. Where two particles touch, whether mineral-ice or mineral-mineral contacts, there will be additional capillary water present, essentially unaffected by adsorption forces associated with the film. If one of the particles is ice, the ice-water interface will alter its shape by melting or freezing to achieve an equilibrium interface. (See also W74-04346) (Knapp-USGS)
W74-04381

IONIC MOBILITY IN PERMAFROST,
Cold Regions Research and Engineering Lab., Hanover, N.H.
R. P. Murrmann.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 352-359, 1973. 8 fig, 2 tab, 20 ref.

Descriptors: *Permafrost, *Ion transport, *Water chemistry, *Pore water, Mass transfer, Soil moisture, Diffusion, Electrical conductance, Ice, Frozen soils, Frozen ground, Conductivity.
Identifiers: *Ionic mobility.

The mobility of ions was studied in frozen earth materials. Although ion diffusion is slower in frozen soil than in unfrozen soil, values of the diffusion coefficients in the temperature range from about 0 to -15 deg C, are high relative to those of solid state diffusion. Although the rate of ion diffusion is lower in frozen silt soil than in frozen clay at a given temperature, it increases with clay content because of the decreasing tortuosity of the soil matrix. The most important parameter influencing ion diffusion in a given soil is temperature, but the influence of temperature cannot be accounted for by the changing thermal energy of the ions. The temperature dependence for the low frequency electrical conductivity of frozen Na-bentonite is similar to that for ion diffusion. Unlike diffusion, the conductance of frozen bentonite clay increases with total water content of the sample. The enhanced conductivity is due to an increased number of charge carriers. The physical movement of ions through the frozen soil matrix and the relatively high values for diffusion coefficients can be accounted for only by the existence of continuous, thin films of interfacial water in which the molecules are relatively mobile compared with those of ice. The temperature dependence of ion diffusion and electrical conductance largely results from a higher ion mobility as interfacial films of water thicken with melting. The increase in electrical conductivity with ice content indicates that the water at silicate-water-ice interfaces is more highly dissociated than the water at silicate-water-silicate interfaces. W74-04382

SOUND AND SHOCK TRANSMISSION IN FROZEN SOILS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
Y. Nakano, and N. H. Froula.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 359-369, 1973. 10 fig, 2 tab, 47 ref.

Descriptors: *Frozen soils, *Soil physical properties, *Sound waves, Ultrasonics, Cryology, Elasticity(Mechanical), Compressibility.
Identifiers: *Shock waves.

The behavior of frozen soils under shock compression was studied by the use of a gas-gun facility. The dilatational velocities of 20-30 Ottawa sand, Hanover silt, and Goodrich clay (fully water-saturated) are presented as a function of temperature. The measurements were made by one of the pulse-transmission methods based on transmitting a short train of 1-MHz pulses and measuring its first arrival time through a circular cylindrical specimen. Unfrozen water content is a major factor contributing to a variation of the dilatational wave velocity with temperature. The shear wave velocity tends to decrease with ascending temperature. The role of unfrozen water in shear wave propagation is not as pronounced as it is on the dilatational wave. (See also W74-04346) (Knapp-USGS)
W74-04383

PRACTICAL EXTENSIONS TO A THEORY OF CONSOLIDATION FOR THAWING SOILS,
Alberta Univ., Edmonton.
J. F. Nixon, and N. R. Morgenstern.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 369-377, 1973. 9 fig, 9 ref.

Descriptors: *Permafrost, *Frozen soils, *Thawing, *Subsidence, *Consolidation, Ice, Soil mechanics, Pore pressure, Shear strength, Soil strength.

When frozen ground thaws, water is released and settlements develop as the water is squeezed from the ground. If the rate of generation of water exceeds the discharge capacity of the soil, excess pore pressures will develop, and these can lead to the failure of foundations and slopes. The one-dimensional theory of consolidation of thawing soils was extended to consider separately problems where the thaw depth is not simply proportional to the square root of time and problems where the change of void ratio of the soil bears a semilogarithmic relationship with the change in effective stress. Curves are presented for power law thaw depth-time relations. (See also W74-04346) (Knapp-USGS)

EXPERIMENTAL PRESSURE STUDIES ON FROST HEAVE MECHANISMS AND THE GROWTH-FUSION BEHAVIOR OF ICE,
Continental Oil Co., Ponca City, Okla.
F. J. Radd, and D. H. Oertle.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 377-384, 1973. 10 fig, 1 tab, 21 ref.

Descriptors: *Frost heaving, *Frozen soils, *Permafrost, *Crystal growth, *Freezing, Cryology, Ice, Laboratory tests, Pressure, Temperature, Porous media.

Experimental and theoretical studies were made of basic frost heave mechanisms. The P-T fusion curve for ice demonstrated non-Clapeyron behavior of pressure upon the solid in contact with its own unconfined liquid. This gave rise to pressure effects on ice that were about 13 times larger than the predicted Clapeyron equation. Ice-lens growth was demonstrated for presures up to 182.81 kg/sq cm. Ice-lens formation is a special form of crystal growth which is common to many liquid-solid transformations accomplished in insoluble fine-particle host systems. (See also W74-04346) (Knapp-USGS)

TRIAXIAL AND CREEP TESTS ON FROZEN OTTAWA SAND,
Cold Regions Research and Engineering Lab., Hanover, N.H.
F. H. Sayles.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 384-391, 1973. 12 Fig, 12 Ref.

Descriptors: *Permafrost, *Soil tests, *Sands, *Frozen soils, Creep, Stress, Strain, Shear strength, Strength, Soil strength.

Triaxial compression tests using a constant rate of applied strain and triaxial creep tests using a constant load were conducted on saturated frozen Ottawa sand and ice to gain a better understanding of the factors that influence the strength and deformation characteristics of frozen soils. The resistance of saturated frozen Ottawa sand in a confined stress condition can be considered as consisting of the cohesion of the ice matrix and the frictional resistance of the sand grains. These sources of strength are nearly independent of each other when the applied rate of strain is greater than 0.02. After the ice matrix has failed at a strain less than 0.01, the soil resistance becomes a function of the normal stress and the apparent angle of the internal friction of unfrozen sand, about 30 deg. For a given temperature the initial or cohesive strength of the frozen sand increases with the rate of applied strain. The rate of increase in the initial shear strength of saturated frozen Ottawa sand and polycrystalline columnar-grained ice decreases with increasing confining pressure. At the higher confining pressures used in this investigation, the initial shear strength is nearly independent of confining pressure at rates of applied strain greater than 0.02. The short-term (periods up to at least 100 h) creep strength of frozen Ottawa sand can be represented by Vyalov's strength equation. It is hypothesized that the long-term ultimate creep strength of saturated frozen sand with porosity of 37% or less is a function of the angle of internal friction of the sand, which could be determined through triaxial tests on unfrozen sand freely drained. (See also W74-04346) (Knapp-USGS)
W74-04386

SAMPLE DISTURBANCE AND THAW CONSOLIDATION OF A DEEP SAND PERMAFROST,
Woodward-Lundgren and Associates, Oakland, Calif.
W. S. Smith, K. Nair, and R. E. Smith.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 392-400, 1973. 3 fig, 8 tab, 5 ref.

Descriptors: *Frost heaving, *Thawing, *Permafrost, *Sampling, *Soil tests, Frozen soils, Soil properties, Freeze-thaw tests.
Identifiers: Sample disturbance.

To evaluate the influence of possible sample disturbance effects on the thaw-consolidation behavior of permafrost, artificially frozen specimens were fabricated in the laboratory where positive control of disturbance effects was possible. Uniaxial thaw-consolidation tests were performed on both recovered permafrost cores and artificially frozen specimens. Undisturbed normally consolidated frozen sand specimens have only very small thaw strains in contrast to the 3-5 percent thaw strains measured on normally consolidated disturbed specimens. However, the

undisturbed underconsolidated specimen showed that significant thaw strains would occur if the sand specimens were not normally consolidated in the frozen state. Disturbance effects were found to be very significant. Knowledge of sample disturbance effects should lead to more economical designs for most situations. (See also W74-04346) (Knapp-USGS)

PORE WATER AND HEAVING PRESSURES DEVELOPED IN PARTIALLY FROZEN SOILS,
Glasgow Univ. (Scotland).
H. B. Sutherland, and P. N. Gaskin.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 409-419, 1973. 6 fig, 10 tab, 19 ref.

Descriptors: *Pore pressure, *Frost heaving, *Frozen soils, *Permafrost, Soil water, Soil moisture, Freezing, Frozen ground, Thawing, Pore water.

Pressures associated with a growing ice lens in a partially frozen soil were studied both theoretically and experimentally. Equations expressing these pressures were derived, and some experimental results supporting them were obtained. The equations were derived initially for uniform spheres, and assumptions have to be made when they are applied to soils. The maximum heaving pressures and the maximum drops in pore water pressure were measured for four soils, and the measured values compared with those predicted. (See also W74-04346) (Knapp-USGS)
W74-04389

SHEAR STRENGTH AT A THAW INTERFACE,
Alberta Univ., Edmonton.
S. Thomson, and E. F. Lobacz.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 419-426, 1973. 9 fig, 4 tab, 11 ref.

Descriptors: *Soil strength, *Permafrost, *Thawing, Frozen soils, Frozen ground, Ice, Shear strength.

Laboratory shear tests were made on a remolded silty soil considered to be typical of those encountered in permafrost areas. Strength characteristics, assessed by means of conventional laboratory tests, were compared with strengths observed in direct shear tests in which a frozen-thawed interface coincided with the shear plane imposed by the direct shear apparatus. Information was obtained from undrained and drained triaxial tests on thawed samples. Strength loss is primarily due to moisture accumulation, including that from melting ice lenses, and to structural changes in the soil mass caused by the freezing process. EFFECTS OF PERMAFROST ON STREAM FLOW CHARACTERISTICS IN THE DISCONTINUOUS PERMAFROST ZONE OF CENTRAL ALASKA,
Dubois and King, Inc., Randolph, Vt.
S. L. Dingman.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 447-453, 1973. 10 fig, 3 tab, 13 ref.

Descriptors: *Permafrost, *Surface-groundwater relationships, *Overland flow, *Alaska, *Arctic, Base flow, Hydrology, Frozen ground, Water table.

The presence of permafrost in the watershed of Glenn Creek, Alaska, is a major influence on the behavior of the stream, but this influence is rather indirect. Its most important roles are in supporting a high water table beneath the valley bottom area, so that overland flow derived from standing water in this area dominates the hydrograph rise and peak; restricting groundwater flow to the stream; and, providing an impermeable surface beneath the moss on the north facing slopes, over which water infiltrating the moss flows to the stream to dominate the hydrographic recession. Identifiers: Aufeis.

Two distinct flow conditions exist in the subarctic streams. During the ice-free periods open channel flow occurs, and, when ice conditions exist, closed conduit flow occurs. In the soil system, the downward freezing of the seasonal frost forms an impermeable barrier when the freezing front coincides with the unfrozen water. The combination of the aufeis and the saturated seasonal frost zone acts as the thin overlying confining layer. Movement of groundwater into the stream bank during the winter period results in a higher groundwater surface than exists during summer. By early June, this water is discharged into the stream when the open channel conditions again exist. If during the winter there is a net increase in bank storage along the entire stream, then the major source of streamflow is from subpermafrost groundwater. Movement of water down the stream channel decreases during the winter for two reasons. First, the quantity of water reaching the stream and adjacent aquifer from surface sources decreases during the winter because precipitation is being stored on the ground surface as snow. Second, a reduction in the cross-sectioned area of unfrozen water occurs in the channel as a result of downward freezing. This restriction of flow causes higher pressures in the stream that result in water flowing onto the surface. This water then freezes and is stored until spring breakup. THE NATURE OF THE SEAWATER-FRESHWATER INTERFACE DURING BREAKUP IN THE COLVILLE RIVER DELTA, ALASKA,
Louisiana State Univ., Baton Rouge.
H. J. Walker.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 473-476, 1973. 3 fig, 1 tab, 12 ref. ONR Contract N00014-69-A-0211-0003.

Descriptors: *Permafrost, *Ice breakup, *Saline water-freshwater interfaces, *Saline water intrusion, *Arctic, *Alaska, Deltas, Ice jams, Rivers, Streams.
Identifiers: Colville River(Alaska).

Permafrost in combination with the seasonal freezing of the upper layers of all surface water results in the virtual cessation of flow in many arctic rivers and the replacement of the freshwater beneath the ice by seawater in their lower reaches. During the period of flooding in spring, seawater is replaced by floodwater that progresses seaward as a wedge beneath the sea ice. The freshwater-seawater interface that develops remains sharp as the floodwater advances. In 1971, the position and nature of the interface that developed off the Colville Delta in Alaska was established with a salinometer, and the volume of displaced seawater was calculated for the period of breakup flooding. Through the first 14 days of river flow, the discharge was 4640 million cu m. During the last 5 days of the flood season, discharge totaled 1060 million cu m. Thus, the total for the flood period was 5700 million cu m. This amount was 58% of the total discharge for 1971. (See also W74-04346) (Knapp-USGS)

MAPPING AND PREDICTING PERMAFROST IN NORTH AMERICA: A REVIEW, 1963-1973,
Geological Survey, Menlo Park, Calif.
O. J. Ferrians, Jr., and G. D. Hobson.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 479-498, 1973. 217 ref.

Descriptors: *Permafrost, *Mapping, Construction, *Reviews, Subsidence, Ice, Frozen ground, Frozen soils, Geophysics, Surveys, Hydrogeology, Soil moisture, Geomorphology, Remote sensing, Data collections, Seismic studies, Resistivity, *Bibliographies.

Methods of mapping and predicting permafrost are reviewed. The discussion is divided into two broad categories, the traditional methods and the geophysical methods. In practice the two categories overlap, and optimum results can be achieved only by utilizing aspects of both. To determine the best method or methods to use for a specific investigation, several factors must be considered--the most important of which are type and detail of information required, amount of area to be covered, complexity of the natural physical conditions in the area, and time and money available for the study. Of primary concern to engineering in permafrost areas are the character of the permafrost soils and the way in which a proposed structure (building, pipeline, and road) and these soils would interact. Wherever possible, areas that are underlain by ice-rich permafrost should be avoided for most engineering projects; otherwise structures must be designed to accommodate the ice-rich condition of the natural foundation material, and special construction techniques acceptable for permafrost areas must be used. These determinations are necessary in order to make intelligent land use assignments, to find and develop groundwater supplies, to plan and achieve effective waste-disposal systems, and to expeditiously explore for and develop mineral, coal, petroleum, and natural gas resources. IN SITU PHYSICOMECHANICAL PROPERTIES OF PERMAFROST USING GEOPHYSICAL TECHNIQUES,
Iron Ore Co. of Canada, Schefferville (Quebec).
O. P. Garg.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 508-516, 1973. 3 fig, 7 tab, 28 ref.

Descriptors: *Permafrost, *Frozen ground, *Borehole geophysics, Seismic studies, Electrical studies, Electrical resistance, Resistivity, Porosity, Data collections, *Canada.

Seismic refraction surveys using a multichannel seismograph and resistivity roundings using a dc portable unit were used to determine the depth of the permafrost table and the base of frozen ground. The depth of penetration achieved in delineating the bottom of permafrost depends on the resistivity contrasts between different layers and the structural and lithological complexities of the area. The resistivity penetration achieved in the Schefferville area of Quebec was the order of 80 m. (See also W74-04346) (Knapp-USGS)

ELECTROMAGNETIC PROBING OF PERMAFROST,
Cold Regions Research and Engineering Lab., Hanover, N.H.
P. Hoekstra, and D. McNeill.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 517-526, 1973. 10 fig, 1 tab, 16 ref.

Descriptors: *Permafrost, *Electrical studies, *Magnetic studies, *Geophysics, *Remote sensing, Surveys, Mapping, Data collections.
Identifiers: *Electromagnetic surveys.

In permafrost, three important objectives can be derived from ground resistivity: measurement of depth of permafrost; mapping of frozen sections in areas of discontinuous permafrost; and mapping of high-ice-content ground. The potential applications of ground and airborne low frequency electromagnetic sensors to map the electrical resistivity of ground are described. There are no apparent technological obstacles in applying two electromagnetic survey methods, the measurement of wave tilt and the measurement of coupling between two loop antennas, to permafrost problems. The theory is well developed, and equipment design has probably reached a satisfactory level. (See also W74-04346) (Knapp-USGS)

THE APPLICATION OF SHALLOW SEISMIC METHODS TO MAPPING OF FROZEN SURFICIAL MATERIALS,
Geological Survey of Canada, Ottawa (Ontario).
J. A. M. Hunter.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 527-534, 1973. 10 fig, 8 ref.

Descriptors: *Permafrost, *Seismic studies, *Mapping, Geophysics, Data collections, Frozen soils, Frozen ground, *Canada.

Shallow refraction seismic methods were successfully applied to permafrost studies. Conventional instrumentaion used in shallow prospecting can be applied to permafrost in summer or winter for a rapid, economical survey. Refraction spreads are generally much longer than those in permafrost-free areas to obtain the necessary depth information. The refraction method may be used to map the occurrence of permafrost in the discontinuous zone under summertime conditions where a thawed active layer is present, because about a meter of seasonal frost at surface in winter restricts the use of refraction methods. Structure within permafrost can be mapped with the refraction technique in conjunction with borehole control for seismic velocities. Massive ice lenses have been delineated at depth. Marine refraction seismic methods may be used to map the occurrence of permafrost under the sea bottom. Anomalous attenuation of refracted waves was observed in regions of thin permafrost. This phenomenon may be associated with refraction of seismic waves in a thin high-speed surface layer. (See also W74-04346) (Knapp-USGS)

INVESTIGATION OF SAMPLING PERENNIALLY FROZEN ALLUVIAL GRAVEL BY CORE DRILLING,
Cold Regions Research and Engineering Lab., Hanover, N.H.
G. R. Lange.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 535-541, 1973. 2 fig, 1 tab, 5 ref.

Descriptors: *Permafrost, *Core drilling, *Drilling fluids, Sampling, Frozen ground, Frozen soils, Gravels, Alluvium.

Excellent cores of frozen gravel and frozen, fractured, and weathered rock at near freezing ground temperatures may be taken by circulating a liquid drilling fluid chilled to temperatures just below the ground temperature, even in summer weather, if the material is well bonded by ice. Compressed air is not feasible for core drilling untilthe ambient air temperature reaches -4 deg C or cooler. Excellent quality cores as small as 70 mm were consistently taken. Borehole wall stabilization was satisfactorily achieved with the chilled liquids, except where the walls were not well bonded by ice. (See also W74-04346) (Knapp-USGS)

SOME PASSIVE METHODS OF CONTROLLING GEOCRYOLOGICAL CONDITIONS IN ROADWAY CONSTRUCTION,
Cold Regions Research and Engineering Lab., Hanover, N.H.
R. L. Berg, and G. W. Aitken.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 581-586, 1973. 5 fig, 2 tab, 10 ref.

Descriptors: *Permafrost, *Subsidence, *Frost heaving, *Road construction, Arctic, *Alaska, Thawing, Freezing, Insulation, Cryology.

The most effective technique for controlling permafrost degradation under roads was that of painting the pavement surface white. Performance of a baled peat heat sink was not satisfactory and this approach should probably not be considered in an area having a thermal regime similar to that at Fairbanks. Two different heat transfer computational techniques are applicable in evaluating thermal designs in permafrost areas. The finite difference technique should have more widespread application because of the flexibility it provides with regard to specification of boundary and initial conditions. ENVIRONMENTAL CONSIDERATIONS FOR THE UTILIZATION OF PERMAFROST TERRAIN,
Cold Regions Research and Engineering Lab., Hanover, N.H.
J. Brown.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 587-590, 1973. 1 fig, 21 ref.

Descriptors: *Permafrost, *Subsidence, *Erosion, *Environmental effects, Highway effects, Arctic, Vegetation effects, Frail lands.

Current utilization of the permafrost landscape is still relatively low as a result of its vastness, remoteness and inaccessibility, and low population usages. However, where population and industrial centers do exist, the solutions of problems caused by the presence and potential degradation of permafrost are expensive. Frequently, symptoms of permafrost degradation occur regardless of the care exercised to avoid them. These changes are characteristically generated at the ground surface as the energy exhange processes are modified; however, these surface effects are transferred into the permafrost. Unsightly vehicle impressions across the uninhabited tundra may be acceptable to some, but an accelerated and headward eroding channel resulting from a poorly designed facility, road, or entrenched vehicle trail is no longer tolerated. The definition of that fine line between permissible and nonpermissible use of the permafrost terrain, both in time and space, should prove to be an excellent point of discussion and cooperation between Northern American, Soviet, and other researchers and planners. SETTLEMENT ASSOCIATED WITH THE THAWING OF PERMAFROST,
Cold Regions Research and Engineering Lab., Hanover, N.H.
F. E. Crory.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 599-607, 1973. 10 fig, 1 tab, 11 ref, append.

Descriptors: *Subsidence, *Thawing, *Permafrost, *Moisture content, Porosity, Frost heaving, Strain, Freezing, Frozen ground, Frozen soils, *Arctic, Soil mechanics.

A direct, simple and accurate method is given for predicting the settlements associated with the thawing of permafrost, using the water content and dry unit weight of undisturbed samples of the frozen ground. The relationships between water content and dry unit weight of saturated frozen and thawed soils are discussed. When the soil is saturated, the potential settlement on thawing can be easily assessed, using only the water content of disturbed or undisturbed samples of the frozen soil. A settlement prediction method can be readily integrated with thermal prediction methods in determining the rate of settlement and strength of thawing soils with respect to time. PERMAFROST PROTECTION FOR PIPELINES,
Esso Production Research Co., Houston, Tex.
H. O. Jahns, T. W. Miller, L. D. Power, W. P. Rickey, and T. P. Taylor.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 673-684, 1973. 13 fig, 3 tab, 23 ref.

Descriptors: *Permafrost, *Oil fields, *Pipelines, *Thawing, Insulation, Frozen ground, Frozen soils, Arctic, *Alaska.
Identifiers: *Heated pipelines.

Pipeline operations in permafrost regions are faced with unique problems that arise from disturbances of the thermal regime in the ground. The thawing of ice-rich soil can result in a loss of adequate pipeline support. The conventional buried pipeline mode may be inadequate in these soils, particularly if the pipeline is to be operated at temperatures above the freezing point. Insulation placed around a warm buried pipeline is an efficient means of reducing heat transfer to the ground and, consequently reducing the rate of thaw. In cold permafrost, insulation alone can prevent the formation of a permanent thaw plug around the pipeline. Insulation and other passive protection systems for a warm buried pipeline tend to become very bulky in warm permafrost if no thawing is to be allowed below the line. Mechanical refrigeration can provide complete permafrost protection below an insulated buried pipeline under all climatic conditions of interest. Refrigeration rates required in such a system are not excessive. Thermal piles equipped with natural convection devices for heat removal during winter can be designed to prevent permafrost degradation around pile supports for an elevated pipeline. Both single-phase and two-phase closed systems are available for this purpose. In large-diameter piles, an open air convection system can also be used. Temperatures at the pile-soil interface may rise to near the freezing point during the summer when the thermal pile is inactive. White paint and insulation can offer permafrost protection for gravel berms. (See also W74-04346) (Knapp-USGS)

STABILITY OF AN UNDERGROUND ROOM IN FROZEN GRAVEL,
Bureau of Mines, Spokane, Wash.
H. C. Pettibone.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 699-706, 1973. 6 fig, 1 tab, 7 ref.

Descriptors: *Mining, *Permafrost, *Gravels, *Frozen ground, *Alaska, Thawing, Subsidence, Freezing, Soil mechanics.

The economic and technological practicability of mining gold from buried frozen gravel placers in Alaska was investigated. In Fairbanks, Alaska, the normal maximum temperatures are below freezing from November through March and, therefore, above freezing during April through October. For 5 months of the year (November through March), an underground room in permafrost gravel at a depth of 15-30 m, 3 m high by 9 m wide by any length (21.3-m length in test), remained open without artificial support. Most rock falls occur within a few days after the opening is excavated, and occasional slabs develop, particularly around silt lenses. Rock falls can be minimized by excavating a smooth roof such as that produced with a continuous miner or with smooth-wall blasting. A possible method of portal support for operation during the winter months only (November through March) would be continuous support (such as corrugated metal pipe through the active layer), then a sealing off of the portal from April through October. This system would rely on the natural permafrost temperature for mine support during the summer months assuming no work during this period, and supercooling the mine during the winter months with natural cold air. For year-round operations, the most satisfactory method of ground support would be to keep the ground frozen by maintaining the air temperature in all working areas at -3.9 deg C or lower. Circulation of such cold, dry air would aggravate the sublimation problem and increase the frequency of gravel falling from the roof. To attempt operations during the warm months without refrigeration (using warm air ventilation), continuous support throughout the working and access areas is imperative. RADIO DEPTH-SOUNDING ON MEIGHEN AND BARNES ICE CAPS, ARCTIC CANADA,
Department of the Environment, Ottawa, (Ontario). Inland Waters Directorate.
S. J. Jones.
Scientific Series No 25, 1972. 13 p, 9 fig, 4 tab, 18 ref.

Descriptors: *Sounding, *Glaciers, *Canada, *Arctic, *Radar, Glaciology, Ice, Depth.
Identifiers: Barnes Ice Cap, Meighen Ice Cap.

Depth measurements through Meighen Ice Cap, Meighen Island, and Barnes Ice Cap, Baffin Island, were obtained by using a 35 MHz radio echo sounder. By comparison with a known borehole depth on Meighen, the velocity of the radio waves in the ice was calculated to be 178 plus or minus 2 m per microsec. The minimum depth that could be sounded was 90 m. On Barnes Ice Cap, the velocity was measured by a wide angle reflection technique as 168 plus or minus 2 m per microsec, and continuous photographic recording of the depth was obtained. Estimates of absorption in the ice from attenuator settings of the echo sounder were significantly greater than previously published values. (Knapp-USGS)

EFFECTS OF STRATIGRAPHIC LAYERS ON WATER FLOW THROUGH SNOW,
Cold Region Research and Engineering Lab., Hanover, N.H.
S. C. Colbeck.
Research Report 311, September 1973. 15 p, 5 fig, 21 ref.

Descriptors: *Snowpacks, *Snowmelt, *Unsaturated flow, Saturated flow, Porous media, Ice, Snow, *Melt water, Drainage, Percolation.

The flow of water through layered snowpacks is discussed. The difference in permeability of layers required to cause large flow diversions is quite small. The effect of slope is large even at small angles. Large variations in the properties of layers in snowpacks occur in time and space. The propagation of values of volume flux (or effective-water saturation) through a snowpack can be predicted for an unsaturated snowpack of any layered composition. The propagation of a known waveform throughout the snowpack can be predicted by constructing as many of the characteristics as necessary (by assuming that no shock front occurs) and

then using the conservation of mass to locate the position of the shock front. When accumulation of water above a less permeable layer produces a perched water table, lateral flow along the layer is likely. In this case, flow at the local scale is considered two-dimensional. In view of the rapid deterioration of ice layers during intense melting, the treatment of these layers as porous media is reasonable. Direct infiltration and lateral flow both increase with the thickness of the water layer, and the relative importance of the lateral mode of flow increases with the thickness of the water layer. For typical values of these parameters, the ratio of flow along the layer to flow through the layer increases by an order of magnitude when the angle of slope increases from 0 deg to 10 deg. THE WATER BALANCE IN ARCTIC AND SUBARCTIC REGIONS--ANNOTATED BIBLIOGRAPHY AND PRELIMINARY ASSESSMENT,
Cold Regions Research and Engineering Lab., Hanover, N.H.
S. L. Dingman.
Special Report 187, June 1973. 131 p, 2 fig, 294 ref. Army Project 4A062112A89420.

Descriptors: *Arctic, *Water balance, *Bibliographies, Abstracts, *Reviews, Hydrologic cycle, Glaciers, Glaciation, Evapotranspiration, Groundwater, Hydrogeology, Precipitation(Atmospheric), Runoff, Streamflow.
Identifiers: *Subarctic regions.

Definitions and boundaries of the arctic and subarctic are reviewed; a map showing these boundaries and annotations of a number of publications dealing with this problem are also presented. A bibliography includes several hundred reports that directly discuss elements of the water balance in arctic and subarctic regions. These annotations are grouped by geographic area: the Northern Hemisphere, Europe, the U.S.S.R., Alaska, Canada, and Greenland and Iceland. For each area, annotations are presented according to water-balance elements: precipitation, evapotranspiration, runoff, streamflow, groundwater contributions to runoff, and changes in glacial storage. A subsequent section gives annotations of articles on the water balance of the Arctic Ocean. This is followed by a brief assessment of the state of knowledge on the water-balance elements in each geographic region. This bibliography is intended to be complete for the period 1950-1971 (some earlier articles are included), especially for articles published in English. A large number of items from the Russian and European literature are included, but the bibliography is probably less complete for these. A total of 688 annotations is included; many articles are annotated in more than one section, as they include information on more than one water-balance element or more than one geographic area. ICE ENGINEERING--SUMMARY OF ELASTIC PROPERTIES RESEARCH AND INTRODUCTION TO VISCOELASTIC AND NONLINEAR ANALYSIS OF SALINE ICE,
Naval Civil Engineering Lab., Port Hueneme, Calif.
M. G. Katona, and K. D. Vaudrey.
Available from NTIS, Springfield, Va. 22151 AD-768 279; Price $3.50 printed copy; $1.45 microfiche. Technical Report R797, August 1973. 71 p, 38 fig, 1 tab, 21 ref, append.

Descriptors: *Sea ice, *Elastic theory, Elastic deformation, Cryology, Ice, *Ice loads, Strength of materials, Structural design, Elasticity(Mechanical).
Identifiers: *Saline ice.

Techniques used to analyze the behavior of sea ice are reviewed. Studies on elastic behavior are reviewed with emphasis placed on plate analysis. Classical plate theory and the finite element method are compared in analyzing ice plates, with special attention given to sea-ice airfields. Because elastic analysis is not totally representative of actual ice behavior, a general formulation is presented which gives the assumptions and procedures for both viscoelastic and nonlinear domains of sea-ice behavior. A laboratory program was initiated to determine material properties that are necessary to extend sea-ice analysis into the inelastic range. (Knapp-USGS)
W74-04793

EFFECTS OF SALT CONCENTRATION CHANGES DURING FREEZING ON THE UNFROZEN WATER CONTENT OF POROUS MATERIALS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
A. Banin, and D. M. Anderson.
Water Resources Research, Vol 10, No 1, p 124-128, February 1974. 4 fig, 2 tab, 12 ref.

Descriptors: *Freezing, *Saline water, *Porous media, *Frozen soils, Frozen ground, Permafrost, Frost, Soil water, Aqueous solutions, Equations, Salts.

By combining equations for salt concentration by water removal from porous bodies with those for freezing point depression in normal solutions, equations were developed for calculating freezing point depression shifts due to the gradual removal of water upon freezing in porous bodies. The same equations can be used for the calculation of shifts in the osmotic potential of the water in drying porous bodies by using a simple conversion factor. Graphs relate the remaining water content to the freezing point shift for various initial soluble salt contents. Good agreement was found between the measured freezing point depression in a silty clay soil treated with three concentrations of sodium chloride and with dimethyl sulfoxide at various contents of unfrozen water and the calculated values. (Knapp-USGS)

WATER FLOW THROUGH SNOW OVERLYING AN IMPERMEABLE BOUNDARY,
Cold Regions Research and Engineering Lab., Hanover, N.H.
S. C. Colbeck.
Water Resources Research, Vol 10, No 1, p 119-123, February 1974. 3 fig, 14 ref.

Descriptors: *Snowpacks, *Melt water, *Percolation, *Unsaturated flow, Infiltration, Water yield, Temperature, Snowmelt, Glaciohydrology, Melting, Mathematical models.

A two-layer model describes water flow over an impermeable boundary. The model consists of vertical flow through an unsaturated layer and flow along a boundary in a saturated layer. The governing equations are solved for the nonsteady case, where the gradient of the thickness of the saturated layer is small compared with the slope of the impermeable boundary. In most cases the discharge from shallow snowpacks will preserve the diurnal cycles of input at the surface, although for deep snowpacks (such as temperate glacier firn) the diurnal cycle is smoothed and only long-term responses are expected. The flow of a diurnal meltwater wave through a small (2.10 m deep by 100 m long) snowpack was calculated as an example. The case of steady flow is also described. (Knapp-USGS)

MODELING OF TURBULENT TRANSPORT IN THE SURFACE LAYER,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
G. L. Smith.
Available from NTIS Springfield, Va. 22151 NASA TN D-7306, copy price, $3.00 domestic, $5.50 foreign; $1.45 microfiche. Technical Note D-7306, December 1973. 33 p, 1 fig, 15 ref.

Descriptors: *Turbulence, *Mixing, *Winds, *Evapotranspiration, Mass transfer, Convection, Dispersion, Turbulent flow, Model studies.

Atmospheric turbulence is sufficiently important to warrant computation of a set of general constants. Donaldson's equations are simplified for the large Reynolds numbers characteristic of atmospheric turbulence. Also, the turbulent Prandtl number is introduced into the model. The boundary conditions suitable for a rough surface (e.g., grass, forest, or city) are considered, and heuristic arguments are given for a set, which is selected. The equations are then solved for a neutrally stable atmosphere (no vertical heat flux), thereby resulting in the familiar logarithmic wind profile. This serves three purposes: The suitability of the governing equations is verified; the suitability of the boundary conditions is verified; and two constants in the method are evaluated for atmospheric application. Next the case of stable stratification above the influence of the surface roughness is treated. From this study comes a mixing length appropriate to the stable layer. This length can be used to determine the point above which the mixing length becomes constant. Finally, the free-convection or unstable case, in which turbulence is thermally produced, is considered. (Knapp-USGS)
W74-04795

2E. Streamflow and Runoff

MATHEMATICAL MODELING OF STREAM STORAGE POTENTIAL,
Arkansas Univ., Fayetteville. Water Resources Research Center.
H. M. Jeffus.
Available from National Technical Information Service as PB-228 021 $3.75 in paper copy, $1.45 in microfiche. Publication No 17, December 1973. 59 p, 12 fig, 27 ref, 2 append. OWRR B-015-ARK(1).

Descriptors: Streamflow, Hydrology, Reservoirs, Water supply, Equations, *Mathematical models, *Storage requirements, Management, Resources development, Engineering, planning, Runoff, *Arkansas, *Hydrologic data.
Identifiers: *Moran's model(Dams).

Streamflow data from unregulated streams in Arkansas were processed through Moran's Model for a dam. The process involved calculating a cumulative gamma distribution for each stream as the streamflow values were incremented in units of 0.1 cubic feet per second per square mile of drainage area. This gamma distribution was then used as input for Moran's Model. The output from Moran's Model includes the probability of the reservoir having zero contents as the size of the reservoir is decreased. The logarithm of the probability of zero contents, ln Po, versus reservoir size, K, is a straight line of the form ln Po = -n-sK. The constants in the equation, n and s, are functions of the logarithm of the draft when the draft is expressed as a percentage of mean annual flow. The equations for ln Po versus K were determined for each stream studied. In addition, a general equation for all streams was determined.

HARMONIC GENERATION OF SHALLOW WATER WAVES OVER TOPOGRAPHY,
Florida State Univ., Tallahassee. Geophysical Fluid Dynamics Inst.
J. Lau, and A. Barcilon.
Journal of Physical Oceanography, Vol 2, No 4 p 405-410, October 1972. 2 fig, 10 ref.

Descriptors: *Shallow water, *Waves(Water), Topography, *Coasts, *Energy transfer, Reflection.
Identifiers: Nearshore.

The reflection and nonlinear interaction between the first and second harmonics of a two-dimensional Boussinesq wavetrain was investigated. Effects of topography are included, the depth departing from a constant in a finite region. It is found that topography can speed up or retard energy transfer between first and second harmonics. The reflection coefficient in the present context is significantly different from the one obtained by using linear theory. This is partly due to partitioning of energy between harmonics. Two examples were studied and the results show that for long-scale topography the rate of harmonic generation depends upon the local depth which affects the detuning and thus the energy transfer between the first and second harmonics. When wave-scale and subwave-scale variations are found, reflection plays an important part. There is a competition for the partitioning of energy between reflection and harmonic generation. (Sinha-OEIS)

PHYSICAL AND DYNAMICAL SCALES FOR GENERATION OF WIND WAVES,
Hydronautics, Inc., Laurel, Md.
J. Wu.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 98, No WW2, Proceedings paper 8879, p 163-175, May 1972. 5 fig, 28 ref, 2 append.

Descriptors: *Wind velocity, Waves(Water), *Ocean waves, *Energy transfer, *Fetch.
Identifiers: *Wind waves, *Wave generation, Airflow patterns, Air-sea interaction.

An analysis is given of relevant physical scales on which coupling takes place between long and short waves, and dynamic scaled for coupling of wind and waves, in the generation of wind waves. Based on these scales and on a separation criterion, it is argued that the airflow separates from dominant waves in the laboratory and from ripples superimposed on dominant waves in the field. This difference may account for the discrepancy between the laboratory-determined growth rate and that observed in the field. Finally, some consideration is given to observational evidence and critical scales relating to the nonlinear mechanism for wave generation. Also, a nonlinear mechanism is speculated to furnish a key link for generation of sea waves-wind generating ripples (surface roughness) due to a sequence of actions of resonance, laminar and sheltering models, and a nonlinear mechanism transferring energy from ripples to dominant waves. Identifiers: *New River(Va), Hybrids(Fish).

A new Percina hybrid, Percina crassa roanoka X Percina oxyrhyncha, is described from the upper Kanawha (New) River system in Virginia. Meristic characters of the hybrid are either intermediate or closer to P. c. roanoka; morphometrics indicate intermediacy or similarity to P. oxyrhyncha. P. c. roanoka, originally described from the Roanoke River drainage, is introduced to the New River system and has characteristics of an opportunistic species. (Knapp-USGS)

THE ELEVATION, SLOPE, AND CURVATURE SPECTRA OF A WIND ROUGHENED SEA SURFACE,
New York Univ., Bronx. School of Engineering and Science.
W. J. Pierson, Jr., and R. A. Stacy.
Available from NTIS, Springfield, Va 22151 NASA CR-2247 Price $4.50 printed copy (domestic) $7.00 (foreign); $1.45 microfiche. National Aeronautics and Space Administration Contractor Report CR-2247, December 1973. 126 p, 30 fig, 5 tab, 63 ref. NASA Contract NASI-10090.

Descriptors: *Waves(Water), *Winds, *Ocean waves, Frequency analysis, Turbulence.
Identifiers: *Roughness(Sea-surface).

The elevation, slope and curvature spectra of a wind roughened sea surface were deduced from an analysis of a wide variety of reports and data sources and verified to a large extent by means of both these sources and other independent sources. The spectra are defined as a function of wave number and depend on the friction velocity. There are five wave number ranges of definition, called the gravity wave-gravity equilibrium range, the isotropic turbulence range, the connecting range due to Leykin and Rosenberg, the capillary range, and the viscous cutoff range. The higher wave number ranges are strongly wind speed dependent, and there is no equilibrium (or saturated) capillary range, at least for winds up to 30 meters/sec. Some properties of the angular variation of the spectra were also found. For high wave numbers, especially in the capillary range, the results are shown to be consistent with the Rayleigh-Rice backscattering theory (Bragg scattering), and certain properties of the angular variation are deduced from backscatter measurements. SPECIAL ANALYSIS OF SHORT INERTIAL-INTERNAL WAVE RECORDS,
Department of the Environment, Ottawa (Ontario). Marine Sciences Directorate.
C. J. Frankignoul, and R. F. Henry.
Manuscript Report Series, No 34, 1973. 26 p, 6 fig, 5 ref.

Descriptors: *Waves(Water), *Time series analysis, Frequency analysis, Simulation analysis, Fourier analysis, Statistics, Statistical methods, Ocean waves.

Various methods of trend removal in time series of ocean waves are compared, by means of experiments on both simulated and observed data, to establish which is the most effective in minimizing leakage between frequency bands during spectral analysis of short segments of a record with a dominant inertial frequency contribution. Removal of

the linear trend defined by joining the end-points of each segment gives substantial improvement. (Knapp-USGS)

SURFACE-WATER AVAILABILITY, LAUDERDALE COUNTY, ALABAMA,
Geological Survey, University, Ala.
D. M. O'Rear, A. L. Knight, J. R. Harkins, and J. R. Willmon.
Alabama Geological Survey Map 107, 1972. 11 p, 5 fig, 1 map, 1 tab, 16 ref.

Descriptors: Water resources, *Surface waters, *Streamflow, *Runoff, *Alabama, Water yield, Flow rates, Average flow, Low flow, Hydrologic data, Water temperature, Water quality, Chemical analysis, *Maps, Hydrographs, Flow duration, Low-flow frequency, Hydrologic budget.
Identifiers: Lauderdale County(Ala).

The Tennessee River, the southern boundary of Lauderdale County, Alabama, has an average flow of 32,800 mgd and Elk River, the southeastern boundary, has an average flow of 2,470 mgd at its mouth. Other streams include Bluewater, Shoal, and Cypress Creeks in the central part of the county with average flows of 180,570, and 265 mgd, respectively, at their mouths; and Second Creek in the western part has an average flow of 90 mgd at its mouth. The statistical index used to describe low flows is the 7-day low flow (7-day Q2). The 7-day Q2 is defined as the lowest average rate of flow for 7 consecutive days occurring at an average interval of 2 years. The Tennessee River has a 7-day Q2 greater than 1,000 mgd; however, the flow is subject to regulation by reservoirs. Elk River has a 7-day Q2 of 165 mg, and Shoal Creek has a 7-day Q2 of 114 mgd. Other streams in the county have 7-day Q2 values that range from 42 to less than 2 mgd. Surface-water data for Lauderdale County are presented in a manner that provides a visual appraisal of surface-water availability which can be compared with other counties in the State. An average-flow and low-flow map is included. Water from the Tennessee River and other streams in the county is of suitable chemical quality for most uses. The water temperature ranges from about 4C in January to 28C in August. (Woodard-USGS)

SPRING RUNOFF FROM HILLSLOPES, SMALL WATERSHEDS, AND RIVER BASINS (VESENNIY STOK SO SKLONOV, MALYKH VODOSBOROV, RECHNYKH BASSEYNOV),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
N. I. Koronkevich, and Z. A. Krylova.
Vodnyye Resursy, No 3, p 93-108, 1973. 5 fig, 1 tab, 48 ref.

Descriptors: *Overland flow, *Runoff, *Slopes, *Small watersheds, *River basins, Land management, Spring, Maps.
Identifiers: *USSR.

Procedures are presented for determining overland flow from data of water-balance and runoff stations. Average long-term overland flow in forested steppe and steppe zones and in the southern part of the forested zone of the USSR is calculated on the basis of runoff from a forested area, a fall-plowed field, and from fields left unplowed since fall. Relations are established between overland flow and streamflow and between overland flow and runoff from small watersheds. The relations obtained can be used to prepare a small-scale map of overland flow in spring from fields in the Don River basin. (Josefson-USGS)

PALEOHYDROLOGY AND SEDIMENTOLOGY OF LAKE MISSOULA FLOODING IN EASTERN WASHINGTON,
Texas Univ., Austin. Dept. of Geological Sciences.
V. R. Baker.
Geological Society of America Special Paper 144, 1973. 79 p, 55 fig, 1 plate, 2 tab, 94 ref, 2 append.

Descriptors: *Paleohydrology, *Floods, *Discharge(Water), *Sedimentology, Sedimentary structures, *Washington, Ripple marks, Sand bars, Sediment transport, *Pleistocene epoch, Columbia River, Stage-discharge raltions, Montana.
Identifiers: Missoula floods(Wash), Columbia Plateau(Wash), Lake Missoula(Mont).

The Missoula floods of late Pleistocene age probably involved the largest discharges of freshwater that have been documented in the geologic record. The Columbia Plateau of eastern Washington contains evidence for flooding in pre-Bull Lake, Bull Lake, and early Pinedale time. The early Pinedale flood was the most extensive and left considerable high-water mark evidence in the form of (1) eroded channel margins, (2) highest flood gravel, (3) minor divide crossings, and (4) ice-rafted erratics. The water-surface gradients and channel geometry provide input data for the slope area and contracted-opening hydraulic calculation procedures. Maximum discharges through scabland channels ranged from 752 million cubic feet per second in the Rathdrum Prairie to 17.5 million cubic feet per second in Rocky Coulee. The flood's duration was amazingly short. Even with gradually waning flows, the early Pinedale flood probably lasted only a week or two. Sixty trains of giant current ripples are recognized in the study area. Mean ripple chords vary from 60 to 425 feet. Mean ripple heights vary from 1.5 to 22 feet. (Knapp-USGS)

WAVES AT CAMP PENDLETON, CALIFORNIA,
California Univ., San Diego, La Jolla. Inst. of Geophysics and Planetary Physics.
W. H. Powers, Jr., L. Draper, and P. M. Briggs.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 1, Chap 1, p 1-8, 1969. 5 fig, 7 ref.

Descriptors: *California, *Waves(Water), *Coasts, *Shallow water, Measurement, *Ocean waves, Seasonal.
Identifiers: Camp Pendleton(CA), *Nearshore processes.

Waves were recorded for nine years at Camp Pendleton, California and the results of an analysis of records over two years are presented graphically. There appeared to be no consistent seasonal distribution of wave heights or periods, so the reults are presented on a yearly basis. The significant wave height exceeded two feet for 34 percent of the time. The calculated height of the highest wave of all during the nine years was 14.5 feet. It is inferred that the most probable value of the height of the highest wave in 50 years is likely to be about 19 feet. (Sinha-OEIS)

SHALLOW WATER WAVES: A COMPARISON OF THEORIES AND EXPERIMENTS,
Tetra Tech, Inc., Pasadena, Calif.
B. Le Mehaute, D. Divoky, and A. Lin.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 1, Chap 7, p 86-107, 1969. 11 fig, 28 ref. DASA-01-67-C-0099.

Descriptors: *Shallow water, *Waves(Water).
Identifiers: Velocity field, *Cnoidal wave theory, Solitary waves, Airy theory, Water depths.

A series of experiments were performed to determine the velocity field and other characteristics of large amplitude shallow water waves. The experimental results were compared with the predictions of a variety of wave theories including those commonly used in engineering practice. While no theory was found exceptionally accurate, the cnoidal wave theory of Keulegan and Patterson appears most adequate for the range of wavelengths and water depths studied. (Sinha - OEIS)

BREAKING WAVE CRITERIA; A STUDY EMPLOYING A NUMERICAL WAVE THEORY,
Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
R. G. Dean.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 1, Chap 8, p 108-123, 1969. 7 fig, 1 tab, 15 ref. DACW72-67-C-0009.

Descriptors: *Shallow water, *Waves(Water).
Identifiers: *Numerical wave theory, Stream function, *Wave height, Water depth, Stability criteria, *Breaking waves.

For progressive waves, the kinematic stability parameter, rather than the dynamic parameter, governs breaking. The dynamic criterion was found to equal zero at breaking; this implies that immediately under the crest, hydrostatic conditions prevail. The enclosed crest angle associated with the limiting wave is approximately equal to 120 degrees, a value determined by previous investigators. Earlier investigators. Earlier investigators, however, required the a priori assumption that the crest form be an angle which is a submultiple of 360 degrees. The breaking wave heights determined here are somewhat higher (0 to 28 percent) than those usually referenced. The stream function wave theory appears well suited for representing the geometry, kinematics, and dynamics of periodic water wave systems up to breaking conditions. (Sinha - OEIS)
W74-04610

HYPERBOLIC WAVES AND THEIR SHOALING,
Kyoto Univ. (Japan). Dept. of Civil Engineering.
Y. Iwagaki.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 1, Chap 9, p 124-144, 1969. 11 fig, 23 ref.

Descriptors: *Coasts, *Waves(Water), *Shallow water.
Identifiers: *Hyperbolic waves, Wave theory, *Shoaling.

Formulae are proposed for various wave characteristics of waves referred to as 'hyperbolic waves'. This theory of the waves does not contain the Jacobian elliptic function but does use the primary function. A combination of the hyperbolic wave theory and the Stokes wave theory make it possible to give a qualitative description of finite amplitude wave characteristics in shallow water before the waves break. (Sinha - OEIS)
W74-04611

EFFECT OF BEACH SLOPE AND SHOALING ON WAVE ASYMMETRY,
M. D. Adeyemo.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. Americal Society of Civil Engineers, Vol 1, Part 1, Chap 10, p 145-172, 1969. 11 fig, 17 ref, 2 plates.

Descriptors: *Beaches, Slopes, *Shallow water, *Waves(Water), Coasts.
Identifiers: *Shoaling, Wave asymmetry, *Breaker zone, *Oscillatory waves.

The geometrical asymmetry associated with shallow water oscillatory waves in the breaker zone is discussed. Three descriptions of wave asymmetry are defined and examined: Wave vertical asymmetry; Wave slope asymmetry; and Wave horizontal asymmetry. The effects of shoaling, produced by beaches of different slope, on the wave asymmetry are examined. Six beach slopes in the range 1:4 to 1:18 were employed, and a quantitative correlation was found to exist between the wave slope asymmetry, wave horizontal asymmetry and the wave vertical asymmetry. An expression is given for the wave horizontal asymmetry based on the expression for the wave vertical asymmetry from the cnoidal wave theory. The theoretical study of wave slope asymmetry made by Biesel and the results of the experimental work on the wave slope asymmetry in the present work were compared and gave a good agreement. THE EFFECTS OF BOTTOM CONFIGURATION ON THE DEFORMATION, BREAKING AND RUN-UP OF SOLITARY WAVES,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
F. E. Camfield, and R. L. Street.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 1, Chap 11, p 173-189, 1969. 11 fig, 11 ref.

Descriptors: *Waves(Water), Topography, Slopes, *Shallow water, Continental shelf, *Bores.
Identifiers: *Solitary waves, Run-up, *Shoaling, Breaking, *Bottom configuration, Long waves.

An initial set of experiments investigated the effect of the initial bottom slope on the breaking and run-up of a wave on a second, higher slope. A second set of experiments considered the effect of a continental shelf configuration on the transmissibility of waves in the shoreward direction, and the decomposition of the waves due to the shallower water depth on the continental shelf. It was found that, in order to make predictions at or near the shoreline for waves generated in deep water, it is necessary to consider the total configuration of the bottom leading to the shoreline. The results for a low initial slope followed by a second higher slope show that the initial slope has a significant effect on both the breaking height and the run-up of the waves. The experiments showed qualitative trends which could be used to predict the effects of various slope combinations. (Sinha - OEIS)

SPECTRA OF THE TEMPERATURE AND HUMIDITY FLUCTUATIONS AND OF THE FLUXES OF MOISTURE AND SENSIBLE HEAT IN THE MARINE BOUNDARY LAYER,
Oregon State Univ., Corvallis. Dept. of Oceanography.
G. T. Phelps, and S. Pond.
Journal of the Atmospheric Sciences, Vol 28, p 918-928, September 1971. 1 tab, 8 fig, 9 ref.

Descriptors: *Temperature, *Humidity, *Fluctuations, *Turbulent boundary layers, *Theoretical analysis, Oceanography, Atmosphere, Moisture, Heat, Velocity, Air-water interfaces, Analytical techniques, Data collections, Data processing, Mathematical models, Statistics.

Data from the Barbados Oceanographic and Meteorological Experiment and from a pre-BOMEX cruise near San Diego are analyzed with emphasis on the similarities and differences between temperature and humidity and on their cospectra and correlations with the velocity fluctuations. Temperature and humidity fluctuations were very similar with only minor differences in data from both San Diego experiments and BOMEX. In the BOMEX the low frequency ends of the temperature spectra were much lower than in San Diego, and consequently, so are the low frequency ends of the temperature-vertical velocity cospectra. On the basis of these results and comparison with other studies it is concluded that the humidity spectra and humidity-vertical velocity cospectra have universal forms when normalized according to the Monin-Obukhov similarity theory. The temperature spectra cannot be interpreted in terms of similarity theory because this theory does not include the effects of radiative transfer. Temperature and humidity are not similar scalars and measurements for one are not necessarily indicative of the behavior of the other. (Jerome-Vanderbilt)

MEASUREMENTS OF THE TURBULENT FLUXES OF MOMENTUM, MOISTURE AND SENSIBLE HEAT OVER THE OCEAN,
British Columbia Univ., Vancouver. Inst. of Oceanography.
S. Pond, G. T. Phelps, J. E. Paquin, G. McBean, and R. W. Stewart.
Journal of Atmospheric Sciences, Vol 28, p 901-917, September 1971. 1 tab, 7 fig, 26 ref, 1 append.

Descriptors: *Measurement, *Turbulent boundary layers, *Fluctuations, *Moisture, *Heat, *Oceans, Oceanography, Atmosphere, Data collection, Data processing, Turbulence, Momentum equation, Analytical techniques, Instrumentation, Aerosols, Velocity, Mathematical models, Model studies, Evaluation, Theoretical analysis, Wind velocity, Humidity, Evaporation.

Results are described of the fluxes of momentum, moisture, and sensible heat by both the eddy correlation and dissipation techniques. The data were collected on the R/V 'Flip' during the Barbados Oceanographic and Meteorological Experiment and during a pre-BOMEX cruise near San Diego. The instrumentation, methods of determining flux and methods of data analysis are described. The spectra of the three components of velocity fluctuations and the cospectra between vertical fluctuations and the downstream velocity, temperature and humidity fluctuations are presented. The fluxes determined by the eddy correlation are compared with those estimated from rates of dissipation, and these fluxes are then used to evaluate the constants in the bulk aerodynamic formulas. The normalized vertical downstream cospectra appear to have universal forms and are similar to earlier results. The normalized vertical temperature cospectra do not appear to have a universal form. The dissipation and eddy correlation methods were found to agree well for momentum flux. The moisture flux shows a strong correlation with wind speed times the mean sea-air humidity difference. This result was based on direct measurements of the flux and agrees well with earlier estimates from evaporation pan data. (Jerome-Vanderbilt)

COMMENTS ON JOHNSON'S PAPER, 'ON THE WIND-DRIVEN CIRCULATION OF A STRATIFIED OCEAN',
RAND Corp., Santa Monica, Calif.
R. C. Alexander.
Journal of Marine Research, Vol 31, No 1, p 87-89, 1973. 5 ref.

Descriptors: *Ocean circulation, *Wind, *Temperature, *Evaluation, Oceanography, Turnovers, Upwelling, Boundary layers, Model studies, Mathematical models, Theoretical analysis, Mixing.

Johnson's (1971) (See W73-13429) assumptions of zero net transport of water from the interior into the eastern boundary region at every latitude and an exponential solution to the thermocline problem create discripancies in his predictions. Although his assumptions seem plausible, they are not obviously true because a net change in north-south flow in the boundary region between some two latitudes might require net east-west flow from the interior at intervening latitudes. The assumption of a balance between transports in the upper and intermediate layers when applied to the intermediate solution leads to values of temperature that increase too rapidly with decreasing latitude to agree with nature. Johnson's results concerning eastern-boundary region and upwelling are based on assumptions rather than analysis, and the observable quantity, temperature, does not agree with nature. More complete analysis of the eastern-boundary region is necessary. (Jerome-Vanderbilt)

FIELD MEASUREMENTS OF SWELL OFF THE ISLAND OF ARUBA,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
W. S. Wilson.
Available from NTIS as AD-694 443 for $6.00 paper copy, $1.45 microfiche. Technical Report No 56, prepared for the Office of Naval Research, Reference 69-9, August 1969. 64 p, 31 fig, 3 tab, 13 ref. Nonr 4010(11).

Descriptors: *Island, Coasts, *Refraction(Waterwaves), *Waves(Water), *Storms, Wave propagation.
Identifiers: Trade Winds, *Venezuela(Aruba), *Swell, Wave ray patterns, Caribbean Sea, Mona Passage.

Intermittently during the winter, swell and associated breakers appear along a beach on the lee side of Aruba, an island off the coast of Venezuela in the Trade Winds. It has been suggested that 14- to 15-sec waves, generated by winter storms off the mid-Atlantic coast of North America, propagate southward to Mona Passage where they are refracted. They then propagate across the Caribbean Sea toward Aruba where they are refracted off the northwest tip of the island and arrive on the leeward coast. Measurements of swell off the beach have been conducted during March 1969. The instrumentation, field procedure, and computational methods are described. Spectra, directions of travel for the swell, and probable generation areas are presented. Reasonable agreement is found between measured swell directions and directions deduced from wave-ray patterns. All evidence obtained is consistent with the hypothesis of a North Atlantic generation area. (Sinha-OEIS)
W74-04723

WAVE FORECASTING RELATIONSHIPS FOR THE GULF OF MEXICO,
Corps of Engineers, Washington, D.C. Beach Erosion Board.

C. L. Bretschneider.
Technical Memorandum No 84, December 1956. 27 p, 16 fig, 1 tab, 21 ref, append.

Descriptors: *Forecasting, *Waves(Water), Numerical analysis, Slopes, Winds, Statistics, Topography, Coasts, *Gulf of Mexico.
Identifiers: *Bottom friction, Wind generated waves, *Hindcasting, *Wind waves, Averaging techniques.

The development and application of a method for computing wind wave data over the Continental Shelf along the United States coast of the Gulf of Mexico is described. A set of generalized forecasting curves is required for each location and each direction to bring the waves in over the shallow sloping bottom to the desired depth. Using deep-water forecasting relationships and taking bottom friction into account, a generalized set of dimensionless forecasting relationships is prepared for each of five locations for which statistical deep-water wave data are compiled. The forecasting curves are intended for the most frequent minimum fetch and corresponding wind speed for various deep-water wave height ranges and average bottom conditions of various directions. For the cases of winds parallel to the coast or from land to sea the curves are applicable to all water depths. However, for the case of winds blowing from sea toward land, the forecasting relationships are satisfactory only for depths of about 20 feet or greater, although the technique has been stretched to a depth of 12 feet for cases where winds are not too high. At depths of about 20 feet or less the bottom slope changes too rapidly for the theory to apply, and longer period swell will be breaking in the surf zone, thereby obscuring the wind wave pattern. (Sinha-OEIS)

CHARACTERISTICS OF STREAMFLOW AT GAGING STATIONS IN THE LOUP RIVER BASIN, NEBRASKA,
Geological Survey, Lincoln, Nebr.
F. B. Shaffer.
Open-file Report 7401, January 1974. 105 p, 16 fig, 7 ref.

Descriptors: *Streamflow, *Nebraska, Statistics, Discharge(Water), Hydrographs, Data collections, *Hydrologic data, Diversion, Withdrawal.
Identifiers: *Loup River(Nebr).

Statistics are presented on the flow of streams in the Loup River basin, Nebraska. As major irrigation projects have been constructed in the basin since gaging of streamflow was begun, the complete record of water discharge at some gaging stations includes periods before and after streamflow was first affected by diversions to an upstream project. Streamflow statistics and exceedence probability graphs of daily discharge are presented for nine sites on the Middle Loup River and its tributaries, seven on the North Loup and its tributaries, and seven on the Loup River and its tributaries below the confluence of the North and Middle Loup Rivers. Also presented are exceedence probability graphs for six canals diverting from the Middle Loup River and for three canals diverting from the North Loup River. (Knapp-USGS)
W74-04794

SURFACE- AND GROUND-WATER CONDITIONS DURING 1959-61 IN A PART OF FLETT CREEK BASIN, TACOMA, WASHINGTON,
Geological Survey, Tacoma, Wash.
F. M. Veatch, G. E. Kimmel, and E. A. Johnston.
Open-file report, 1966. 42 p, 20 fig, 7 tab.

Descriptors: *Surface-groundwater relationships, *Hydrologic data, *Alluvial channels, *Washington, Discharge(Water), Streamflow, Hydrogeology.
Identifiers: Tacoma(Wash).

The Flett Creek area near Tacoma, Washington, was studied to define its groundwater and surface-water characteristics. The study is intended to provide a basis for comparisons and analyses of changes in water regimen that may develop as a result of man's activities, including construction of storm sewers and landfill, and expansions in population, industry, and water use. Much of the Flett Creek channel lies on thick beds of peat; these, in turn, are underlain by permeable glacial deposits. The groundwater and surface water are in hydraulic continuity except in one short reach. In some reaches the creek alternately gains and loses flow depending on the position and slope of the adjacent water table. The flow of Flett Creek ranged from 1.2 to 40 cfs during the period May 1959 to December 1961. The chemical quality of the surface runoff and the water from wells is roughly the same, although minor seasonal variations between them occur. Water from both sources is generally soft and low in mineral content. The construction of a new deeper channel for the creek, for passing increased flood inflow from storm sewers, would have the ultimate effect of depressing the water table adjacent to the creek by an amount approximating the depth of excavation. The peat would present problems in channel construction, and would seriously affect the structural stability of an enlarged channel. (Knapp-USGS)

HYDROLOGIC DATA FOR SMALL RURAL CATCHMENTS IN AUSTRALIA, 1973,
Snowy Mountains Engineering Corp., Cooma (Australia).
J. A. H. Brown.
Australian Water Resources Council Technical Paper No 6 (Research Project No 68/1), 1973. 146 p, 1 fig, 2 tab, 9 ref, 14 append.

Descriptors: *Data collections, *Small watersheds, *Australia, *Hydrologic data, Runoff, Floods, Flood control, Data storage and retrieval, Data processing.

The Australian Water Resources Council's Research Project 68/1 on the hydrology of small rural catchments involved the review, compilation, processing and analysis of data from small rural catchments (less than 10 sq mile). The ultimate aim was improving techniques for estimating yields and floods from these catchments. A large volume of streamflow and rainfall data were processed and stored on magnetic tape. Soils data and topographic data were also compiled and preliminary analysis of the data carried out. The report contains detailed lists of all the data which were processed, a summary of the analyses that were carried out, and recommendations for future activities. (Knapp-USGS)

STUDIES ON THE VALIDITY OF DARCY'S LAW FOR FLOW IN NATURAL SANDS,
Georgia Univ., Athens. Dept. of Geology.
R. E. Carver.
Available from National Technical Information Service as PB-228 022 $3.75 in paper copy, $1.45 in microfiche. Georgia Institute of Technology Environmental Resources Center, Atlanta Report, ERC-1573, November 1973, 44 p, 7 fig, 30 ref, 2 append. OWRR A-037-GA(1). 14-31-0001-3810.

Descriptors: *Darcy's Law, *Permeability,Transmissivity, Hydraulic conductivity, Saturated flow, Non-newtonian flow, *Subsurface flow, Porous media, Permeameters, Wells, *Sands.
Identifiers: *Well entrance losses.

Well entrance losses are commonly assumed to be due, in part, to non-Darcy flow near the well, but concrete evidence for non-Darcy flow of water in natural sands at any reasonably large macroscopic flow velocity does not appear to exist. On the other hand, at very low flow velocities, the permeability of sands varies with macroscopic flow velocity in a very complex way, and some earlier studies purporting to support the validity of Darcy's Law at very low flow velocities actually support this view. With increasing flow velocity, beginning with velocities below 0.005 cm/sec, permeability increases rapidly in the alpha intergranular flow regime, decreases rapidly through the beta flow regime, increases relatively slowly with increasing velocity in the gamma flow regime, then remains nearly constant or decreases in the delta flow regime. The changes in flow resistance appear to be related, in part, to the surface chemistry of quartz. Experiments at high flow velocities showed no dramatic change in permeability in the range of 1 to 2 cm/sec., but, because of problems with piezometry, the results are not considered conclusive. One basic cause of 'well entrance losses' probably is over estimation of the average permeability of the aquifer, either because gas permeameters are used, or because tests with water are conducted in the first three flow regimes.
W74-04307

THE RESPONSE TO TIDAL FLUCTUATIONS OF A LEAKY AQUIFER SYSTEM,
Hawaii Univ., Honolulu. Water Resources Research Center.
J. A. Williams, and T. C. Liu.
Available from National Technical Information Service as PB-227 847 $5.25 in paper copy, $1.45 in microfiche. Technical Report No 66, July 1973. 41 p, 9 fig, 7 ref, append. OWRR A-020-HI(2). 14-31-0001-3211.

Descriptors: *Aquifers, *Tides, Groundwater, *Base flow, *Mathematical models, Computer programs, Tidal waters, Model studies.
Identifiers: *Leaky aquifers, Response tides, Wave propagation.

A system of two isotropic and homogeneous infinite aquifers, which are separated by an aquitard and subject to tidal fluctuations along their coastal boundary, has been analyzed and a mathematical model has been developed for the response of this system to tidal changes. The mathematical model consists of equations for the amplitude and phase of the response of both aquifers to a periodic tide. A computer program using the IBM 360 has been written for the evaluation of these equations. Both the mathematical model and the program have been verified by an electric analog model constructed for that purpose. The mathematical model was evaluated for an aquifer system where both aquifers have the same transmissability (and therefore the same leakage factor) but where the storage of the upper aquifer was 100 times that of the lower aquifer. Tidal periods of 0.5, 1, and 14 days were used. The results indicate that deviations from a response corresponding to the no-leakage case could be from 50 to 100 percent or more for both the amplitude and the phase angle of either aquifer. Also, such deviations were produced by a relatively moderate amount of leakage, i.e., 1/B sq > or = to 0.154/10,000 sq ft.

GROUNDWATER INVESTIGATIONS IN PERMAFROST REGIONS OF NORTH AMERICA: A REVIEW,
Geological Survey, Boston, Mass.
J. R. Williams, and R. O. van Everdingen.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 435-446, 1973. 73 ref.

Descriptors: *Permafrost, *Groundwater, *Arctic, *Reviews, Surface-groundwater relationships, Groundwater basins, Saline water-freshwater interfaces, Hydrogeology.

Typical recent and current studies dealing with water balance of small basins, saline water-freshwater interface in arctic deltas, location of water supplies in arctic regions, and occurrence of artesian pressures and their effects on wells and pipelines in permafrost areas are reviewed. A natural consequence of the basin hydrology approach is the current application of mathematical and conceptual models to simulate the operation of the hydrologic cycle. Lack of data on infiltration rates, soil moisture, distribution of permafrost, and on hydraulic conductivity of the subsurface materials has prevented assessment of the groundwater component in the basins studied. Groundwater studies are part of the evaluation of the impact of proposed developments on the environment. In these studies, less emphasis is placed on groundwater supply and more on the role of groundwater and frost-heaving pressures developed during the freeze-thaw cycle and their effect on slope and riverbed stability and on the nature and extent of icings. Increased exploration for oil and gas in the North American Arctic has yielded extensive information on groundwater flow systems and quality of water in bedrock aquifers. RECHARGE OF A CENTRAL ALASKA LAKE BY SUBPERMAFROST GROUNDWATER,
Alaska Univ., College.
D. L. Kane, and C. W. Slaughter.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 458-462, 1973. 3 fig, 11 ref.

Descriptors: *Permafrost, *Lakes, *Alaska, *Surface-groundwater relationships, Discharge(Water), Hydrogeology, Temperature, Groundwater movement.

The existence of an unfrozen zone beneath a lake surrounded by permafrost and recharge of the lake from subpermafrost aquifers through the thawed zone were shown both by piezometer and temperature data. In the zone of discontinuous permafrost, including the lowlands of central Alaska, it is likely that many lakes indicate hydrologic connections between subpermafrost aquifers and the surface. While the bog lake studied is a point of discharge for groundwater, other small lakes might be either recharge or discharge points for subpermafrost aquifers. (See also W74-04346) (Knapp-USGS)

RISK OF UNCONTROLLED FLOW FROM WELLS THROUGH PERMAFROST,
Cold Regions Research and Engineering Lab., Hanover, N.H.
K. A. Linell.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 462-468, 1973. 6 fig, 2 tab, 4 ref.

Descriptors: *Water wells, *Permafrost, Wells, Frozen ground, Artesian wells, Well casings, Water temperature, Freezing, Thawing, Subsidence, *Alaska.

Where groundwater below permafrost is under artesian pressure, risk exists that piping, erosion, uncontrolled flow, settlement of wellhead facilities, and damage to the well casing may occur when a water well, oil well, or subsurface exploration boring is drilled through the permafrost. Possible consequences attending uncontrolled flow include formation of a constantly enlarging thaw and erosion pit at the well, permafrost degradation and terrain damage in the area exposed to surface and subsurface discharge from the well, ice fog and ground icing in winter, development of frost mounds, and waste of expensively developed water. Reestablishment of control may be difficult and expensive. Reliable, effective resistance to piping, erosion, and blowout under artesian pressure and flow conditions of significant magnitude in a well drilled through permafrost requires proper initial installation of the well casing, based on accurate knowledge and evaluation of the permafrost conditions. If the permafrost is thaw-stable, without excess ice, the casing should be tightly installed through the full permafrost zone, except that in thaw-stable bedrock casing is not needed unless for other reasons than thaw instability. If the permafrost is high-ice-content, thaw-unstable soil or rock, not only must the casing be tightly installed in the permafrost but the maintenance of a permanently frozen contact and seal between the casing and the permafrost may also be necessary. A GROUNDWATER SUPPLY FOR AN OIL CAMP NEAR PRUDHOE BAY, ARCTIC ALASKA,
Metcalf and Eddy, Inc., Boston, Mass.
R. G. Sherman.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 469-472, 1973. 2 fig, 12 ref.

Descriptors: *Groundwater, *Permafrost, *Arctic, *Alluvial channels, Alluvium, Frozen ground, Water supply, *Alaska, Ice, Water quality, Potable water.
Identifiers: *Sagavanirktok River(Alaska).

In designing an oil camp on the west bank of the Sagavanirktok River 11 km south of Prudhoe Bay, the first step was to locate a year-round supply of potable water. Permafrost thickness of as much as 610 m in the campsite area eliminated consideration of deep aquifers. Potential sources in lakes and in the nearby Sagavanirktok River and in aquifers beneath the lakes and the river were explored. A year-round supply of good quality water exists in an alluvial aquifer beneath the Sagavanirktok River. At sites near the coastline, the aquifer may be subject to saltwater encroachment, induced either by heavy pumping during periods of zero river flow or by natural upstream migration of the saltwater as flushing action of the freshwater underflow supported by streamflow ceases. W74-04396

PREDICTION OF THE 1972 MANAGUA, NICARAGUA, EARTHQUAKE FROM GROUNDWATER CHANGES, INFERRED PROBABILITY OF EARTHQUAKES IN THE CITY OF MANAGUA, NICARAGUA, DURING THE SUMMER OF 1973,
Santos and Heilemann, Managua (Nicaragua).
C. Santos.
Available from NTIS, Springfield, Va 22151, AD-762 134 Price $3.00 printed copy; $1.45 microfiche. Army Engineer Waterways Experiment Station Translation No 73-7, May 1973. 19 p, 3 fig, 5 tab, 8 ref.

Descriptors: *Earthquakes, *Recharge, *Water levels, *Groundwater, Faults(Geologic), Geophysics, Droughts, Rainfall. Infiltration.
Identifiers: *Nicaragua(Managua).

Earthquakes in Managua, Nicaragua, are relatable to drought years and restrictions to replenishment of the Managua aquifer. Changes in water loading induce stresses which are relieved by fault movement and corresponding earthquakes. The December 1972 Managua earthquake was predicted before the event. These significant observations should be supplemented by other measurements such as geodetic strain, tilt, gravimetric anomalies, etc. There is a need to investigate hydrologic cycles in relation to tectonic activity in many earthquake-prone areas. (Knapp-USGS)
W74-04467

HYDROGEOLOGIC CHARACTERISTICS OF THE SURFICIAL AQUIFER IN NORTHWEST HILLSBOROUGH COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
W. C. Sinclair.
Open-file report 73023, 1973. 97 p, 4 tab, 10 ref.

Descriptors: *Hydrogeology, *Aquifer characteristics, *Florida, *Groundwater movement, Leakage, Recharge, Permeability.
Identifiers: Floridan aquifer, Hillsborough County(Fla).

Lithologic and gamma logs of 59 test holes in Hillsborough County, Florida, were used in conjunction with laboratory analyses of samples to define the hydrogeology of the unconsolidated deposits of the surficial aquifer overlying the limestone Floridan aquifer. The surficial aquifer comprises an upper fine sand unit which averages about 15 feet thick and a lower sequence of sandy clay and clayey sand layers which average about 25 feet thick. Median grain size, specific yield, and vertical permeability of the surficial aquifer decrease downward. The coefficient of vertical permeability of the sand is about 100 gallons per day per square foot, but the coefficient of vertical permeability of the lower sand and clayey sand is much lower ranging from 0.01 to 0.1 gallon per day per square foot. A confining layer of dense clay underlies the surficial aquifer separating it from the Floridan aquifer below. The potentiometric surface in the surficial aquifer stands an average of 10 feet above that in the Floridan. Leakage from the surficial aquifer to the Floridan occurs through the confining layer as well as through perforations in the confining layer. A regional estimate of leakage, based on the average coefficient of vertical permeability, is about 140,000 gpd per square mile. (Knapp-USGS)
W74-04468

EVALUATION OF THE GROUND-WATER SUPPLY AT EIGHT SITES IN GLACIER NATIONAL PARK, NORTHWESTERN MONTANA,
Geological Survey, Helena, Mont.
A. J. Boettcher.
Open-file report, 1974. 30 p, 17 fig, 2 tab, 2 ref.

Descriptors: *Groundwater, *National parks, *Montana, Hydrogeology, Water resources development, *Water supply, Water yield, *Water quality, Calcium, Bicarbonates.
Identifiers: Glacier National Park(Mont).

Seven of eight test holes drilled in Glacier National Park derive water from the Quaternary alluvial or glacial deposits. The eighth test hole was dry. Aquifer tests indicated that production wells at the seven sites will yield enough water for domestic or campground uses. Estimated maximum pumping rates range from 4 to 50 gallons per minute. The water is of excellent chemical quality and the major dissolved constituents are calcium and bicarbonate. (Knapp-USGS)

SOIL DEVELOPMENT AND PATTERNED GROUND EVOLUTION IN BEACON VALLEY ANTARCTICA,
Washington Univ., Seattle.
F. C. Ugolini, J. G. Bockheim, and D. M. Anderson.
In: International Conference on Permafrost, Yakutsk, USSR, 1973. p 246-254, 1973. 7 fig, 2 tab, 15 ref.

Descriptors: *Soil formation, *Antarctic, *Permafrost, Soils, Freezing, Thawing, Frozen ground, Frozen soils, Frost, Frost action, Mass wasting, Solifluction.
Identifiers: Polygonal ground, Patterned ground, *Antarctica(Beacon Valley).

Soil formation in Antarctica is restricted not only by the limited extent of ice-free areas but also by the continuous low temperatures and the paucity of liquid water. Soils of continental Antarctica are of the desert type; they are devoid of an organic surficial layer, display coarse textures, are extremely dry, pulverulent, and show poor horizon distinction with minor textural and structural changes and little color differentiation. Two major soil units are distinguished in the northeast half of Beacon Valley, Antarctica. These two mappable units are related to the age of the glacial deposits and to the surficial expressions of nonsorted polygons. The soils of the well-developed polygons appear immature in contrast to the more mature conditions found in the poorly expressed polygons. The soils of the poorly expressed polygons have a fine texture, are more structured, are more oxidized, contain more salts, and have a greater thickness above the ice-cemented permafrost than the soils of the well-developed polygons. The soils of the centers are more developed than the soils of the troughs. The growth of the sand wedges is greatly affected by the degree of soil development in the troughs. Once the soils in the troughs have acquired a compound structure enhanced by the presence of salts and clays, they are not able to flow and, therefore, to fill the contraction cracks. This lack of uniformity in growth rate may account for the observed discrepancy between the age of the wedges and the degree of soil development. (See also W74-04346) (Knapp-USGS)

ON SOLVING THE UNSATURATED FLOW EQUATION: 2. CRITIQUE OF PARLANGE'S METHOD.
Australian National Univ., Canberra. Research School of Physical Sciences.
J. H. Knight, and J. R. Philip.
Soil Science, Vol 116, No 6, 407-416, December 1973. 4 fig, 2 tab, 12 ref.

Descriptors: *Unsaturated flow, *Equations, Mathematical studies, Numerical analysis, Soil water movement, Sorption.
Identifiers: *Parlange's method.

The physical content of Parlange's method of solving the flow equation is explored. His first approximation satisfies continuity in the integral sense, but the second and higher approximations do not. Approximations beyond the first lack of any constraining link between the separate steps of 'satisfying continuity' and 'satisfying Darcy's law', which make up each interation. There is, consequently, nothing in the procedure to ensure convergence. A detailed investigation establishes the nonconvergence of the method when applied to one-dimensional sorption. The first approximation is best, and the higher approximations make oscillations of increasing magnitude about the exact solution. Two illustrative examples are given. The utility of Parlange's method is thus simply the utility of the first approximation: the dependence of this on the shape of the diffusivity function and on the flux-concentration relation is discussed. The method cannot be applied to two- and three-dimensional systems other than radially

symmetrical ones. (See also W74-02464) (Knapp-USGS)

Descriptors: *Soil water movement, *Expansive soils, *Diffusivity, Saturated flow, Diffusion, Sorption.

A method for estimating the diffusivity function of a saturated swelling system is based on an equation linking the sorptivity, the diffusivity function, and the flux concentration, and uses appropriate values of the flux-concentration relation to set limits of the diffusivity function. For the material used in the experiments demonstrating the procedure, the calculation errors were no more than 7.5 percent. (Knapp-USGS)

INFLUENCES OF SOIL DENSITY, CLAY SILT AND HUMUS CONTENT ON MEASUREMENTS OF SOIL WATER BY NEUTRON GAUGES, (IN GERMAN),
Technische Universitaet, Munich (West Germany). Institut fuer Pflanzenbau und Pflanzenzuechtung.
H. Hanus, A. Suess, and G. Schurmann.
Z Pflanzenernaehr Bodenkd. Vol 132, No 1, p 4-16, 1972, Illus, (English summary).
Identifiers: *Clay, *Humus, Measurements, Neutron gauges, *Silt, *Soil water, *Soil density, Organic matter.

Multiple regressions were used to establish calibration curves, whereby the measured pulse rate, the humus-, clay- and silt content, dry density of the soil and moist density were considered. Dry density was a main factor for determining the absolute water content in a soil when using a neutron gauge. There was no effect of the humus content, probably because of a lower density in soil with a high content of organic matter. It was assumed that with an increasing clay content the number of neutron absorbing ions also rose. The results of neutron gauge measurements showed after a correction for dry density an accuracy equivalent to 3-4 gravimetric readings with soil sample cores of 100 cm3. In cases where higher accuracy is required, soil factors other than dry density and clay and silt content should be considered. The necessary corrections for dry density and clay and silt content are shown in equations.--Copyright 1973, Biological Abstracts, Inc.

Vodnyye Resursy, No 3, p 70-92, 1973. 18 fig, 54 ref.

Descriptors: *Soil moisture, *Measurement, *Remote sensing, *Satellites(Artificial), Spectroscopy, Photography, Surveys, Terrain analysis, Infrared radiation.
Identifiers: USSR.

Remote sensing methods of soil moisture determination were investigated in three principal regions of the spectrum: the visible region (wavelengths 0.4 to 0.7 microns); the infrared region (wavelengths 0.7 to 15.0 microns); and the microwave region (wavelengths 0.8 to 10.0 cm). Remote sensing techniques are examined in ground experiments and in simulation studies based on data from aircraft and spacecraft. Soyuz-9 reflection spectra, Gemini-4 photography, and Nimbus-1 images are analyzed in the visible region of the spectrum. Nimbus-3 and Apollo-9 daytime images in the near-infrared region and Cosmos-226 daytime and nighttime images in the far-infrared region are analyzed in the infrared region of the spectrum. Emitted radiation data obtained from Cosmos-243 are analyzed in the microwave region of the spectrum. A multispectral and multiscale system of repetitive surveys at wavelengths ranging from 0.5 to 12.0 microns and from 0.8 to 9.0 cm or more and including control information from ground and aircraft is recommended. QUICKCLAYS AS PRODUCTS OF GLACIAL ACTION: A NEW APPROACH TO THEIR NATURE, GEOLOGY, DISTRIBUTION AND GEOTECHNICAL PROPERTIES,
Leeds Univ. (England). Dept. of Civil Engineering.
J. G. Cabrera, and I. J. Smalley.
Engineering Geology, Vol 7, No 2, p 115-133, October 1973. 4 fig, 2 tab, 54 ref.

Descriptors: *Quick clays, *Glacial drift, Soil mechanics, *Clays, Clay minerals.

Quickclays are products of glaciation, which accounts for their limited distribution. Glacial grinding provides the fine silt and clay sizes required to constitute quickclays. Two major factors account for the geotechnical properties. A composition factor is related to material comprising the soil system and a leaching factor is related to the clay-mineral content of the soil. Soils can be divided into three types, based on criteria of particle size and type of interparticle bond. The three main soil types have: (a) small particles and long-range forces--the bond/weight ratio R is high; (b) small particles and short-range forces--R>1; and (c) large particles and short-range forces--R<1. The most important property is a preponderance of inactive bonds in the soil system. This is achieved by a high content of nonclay mineral particles, and also may be assisted by leaching and cementation. If more than a critical proportion of long-range bonds are present, the required very high sensitivity does not occur. The initial failure of the soil may be treated as tensile using a volume failure criterion; the low settling velocity of the very small particles allows the solid-liquid transformation to occur after a modest shock loading. Observations of low thixotropy, lack of secondary settlement and sudden failure in compression tests can be explained by requirements of particle size and material. (Knapp-USGS)

STRIATED GROUND, A TYPE OF PATTERNED GROUND IN THE PERIGLACIAL AREA OF THE VENEZUELAN ANDES, (IN SPANISH),
Instituto Venezolano de Investigaciones Cientificas, Caracas.
C. Schubert.
Acta Cient Venez. Vol 23, No 3, p 108-114. 1972. Illus. (English summary).
Identifiers: Diurnal melting, Nocturnal freezing, *Patterned ground, *Striated ground, Winds, *Venezuela(Andes area), *Periglacial areas.

Striated ground was found above 3600 m elevation in paramo de La Culata, Pico Espejo, and in the vicinity of Timoncito Glacier, in the Central part of the Venezuelan Andes. This ground is formed by the nightly freezing and diurnal melting of the water contained by the soil. The striae are a consequence of the alignment of lumps of fine to coarse sand, separated by small discontinuous channels, approximately 1-3 cm wide. The surfaces of striated ground generally are not wider than 1 m. Sorting was observed in the form of pebble-rich and pebble-poor zones. Striated ground in process of formation was observed in Pico Espejo. The needle ice, formed during the nocturnal freeze, filled the channels between striae. No sorting was observed, which is a probable indication of very recent formation of the feature, probably the night before. The orientation of the striae is compared with the wind direction measured in Pico Espejo. The formation of needle ice in the ground reflects the direction of the freezing wind and produces striae oriented in that direction--Copyright 1973, Biological Abstracts, Inc.

WATER REGIME IN ALLUVIAL FAN SOILS OF THE ARAKS RIVER, (IN RUSSIAN),
M. R. Abduev.
Izv Akad Nauk SSR Ser Biol Nauk. 4. p 47-53. 1971. Illus.
Identifiers: *Alluvial fan soils, Rivers, Soils, *USSR(Araks River), Groundwater, *Soil moisture.

From 1962-1965 small plots were laid out to include all soil diversity. The water regime in this alluvial fan is quite complex not only in separate zones of soils, but also in individual areas. At the same time some humidification and moisture dynamism appeared to be of more general character to these soils. A layer of pronounced humidification was marked in all plots, which increased in the direction of decreased slope. This must have been linked with the rise of ground water in this direction. Also the pronounced dynamism of moisture content in the profile of these soils seemed to be a common characteristic.--Copyright 1973, Biological Abstracts, Inc.

WATER CONDITIONS IN SOILS OF THE BOGAR ZONE OF THE UZBEK SSR,
A. A. Rode.
Available from NTIS, Springfield, Va. 22151 as TT-70-57115 for $3.00 printed copy; $1.45 microfiche. Indian National Scientific Documentation Centre, New Delhi, Technical Translation Report TT-70-57115, 1972. 53 p, 11 fig, 10 tab, 15 ref. (Originally published in Akademiya Nauk SSSR, Trudy Pochevennogo Instituta im. V. V. Dokuchaeva, Vol 25, p 94-129, 1947).

Descriptors: *Soil moisture, *Water balance, Soil water movement, Soil management, Mulching.
Identifiers: *USSR(Uzbek SSR-Bogar zone).

The water regime of soils of the bogar zone of the Uzbek SSR is of the impermacidal type (according to the terminology of Vysotskii). The annual depth of moisture penetration does not exceed 1 m and the water content which attains the value of water-holding capacity of soils rarely exists beyond this depth. The moisture exchange as a whole takes place in the soil layers only to the depth of 2.5 m. The soil moisture during a year varies from the values somewhat exceeding water holding capacity (field water capacity) to wilting moisture. The moisture reserve in soils starts increasing from the end of October and attains the maximum value in the end of March or beginning of April. After this period it starts decreasing until the precipitation stops. In summer months when the moisture reserve approaches the minimum value, its rate of decrease again falls. The soils which are under crops or wild plants lose all the moisture they receive in form of precipitation. The soils which are not covered with plants (bare fallow) lose less than the loss in case of soils covered with plants. Therefore, bare fallow, if properly cared, serves as a means to preserve moisture. (Knapp-USGS)

Descriptors: *Water quality, Lakes, *Mapping, *Colorado, *Specific conductivity, Data collections, Surveys, Dissolved solids, Water types, Light penetration, Secchi disks, Biological properties, Algae, Reviews.
Identifiers: *Lakes inventory(Colo).

Results are summarized of an inventory of the lakes in the northern one-third of the Colorado Front Range Urban Corridor. The inventory was conducted to assemble information that might be helpful in planning the best and most beneficial use of lakes in an area of rapid population growth. Lake size and water-quality data are included. Size data include most of the lakes of 2 hectares (20,000 square meters, about 5 acres) or greater. Water-quality data are provided for most lakes larger than 10 hectares (about 25 acres). As expressed by values of specific conductance is micromhos per centimeter, most of the lakes contained water of good quality. Conductance was 750 or less in 57 of the 115 lakes measured; it ranged from 750 to 1,500 in 30 lakes, ranged from 1,500 to 4,500 in 21 lakes, and exceeded 4,500 in only 7 lakes. Samples from Button Rock Reservoir, Flatiron Reservoir, and Pinewood Lake had specific conductance less than 40. The highest conductance waters were from Coleman Reservoir (12,000), Newell Lake (12,500), and 27 unnamed lake (15,000) located 3.5 kilometers north-northeast of Berthoud. Most of the lakes in the corridor contained water that is alkaline. Transparency, as measured by a Secchi disk, was less than 1.2 meters in 87 of the 112 lakes in which it was measured. Algal concentrations ranged from 77 to 13,000 cells per milliliter in samples collected from 23 lakes. (Woodard-USGS)

WATER LEVEL FLUCTUATIONS OF THE CASPIAN SEA (K PROBLEME UROVENNOGO REZHIMA KASPIYSKOGO MORYA),
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
D. Ya. Ratkovich, I. S. Zhdanova, and V. Ye. Prival'skiy.
Vodnyye Resursy, No 3, p 45-69, 1973. 9 fig, 8 tab, 18 ref.

Descriptors: *Lakes, *Water levels, *Water level fluctuations, Variability, Water balance, Inflow, Evaporation, Runoff, Statistical methods, Statistical models, Probability, Forecasting, Curves, Equations.
Identifiers: *USSR, *Caspian Sea.

The level of the Caspain Sea is undergoing fluctuations induced by the natural variability of inflow to the sea and of evaporation from its surface. Under present climatic conditions the range of natural fluctuations in level may be about 3 m. As a result of withdrawals of runoff from rivers of the Caspian basin, the average level of the sea has dropped by about 2 m to its present elevation of about 28.5 m below sea level. A further decline in level by more than 1.0-1.5 m will inflict great damage on fish stocks of the sea. Under average hydrometeorological conditions and with an intensive increase in water consumption, the level of the sea may decline an additional 2.0-2.5 m by the year 2000. Measures to replenish the water resources of the sea and to curtail evaporation from its surface can, to a great extent, prevent a further drop in sea level and avoid severe consequences for the national economy of the country. According to preliminary data, it is quite possible to hold the further decline in sea level to about 1 m. (Josefson-USGS)

BENTHIC FAUNA OF A TROPICAL MAN-MADE LAKE (VOLTA LAKE, GHANA 1965-1968),
Makerere Univ., Kampala (Uganda). Dept. of Zoology.
T. Petr.
Arch Hydrobiol. Vol 70, No 4, p 484-533. 1972, Illus.
Identifiers: *Benthic fauna, *Chaoborid, *Chironomids, Ecology, *Ephemeroptera(Nymphs), *Ghana(Volta Lake), Tropical lakes, Invertebrates, Macrophytes.

Quantitative and qualitative changes in the individual taxa of the bottom fauna were followed in the Volta man-made lake over the filling period 1965-1968. The changes in the individual invertebrate taxa during this period are considered in relation to the changes environmental factors, such as oxygen content, substratum, degree of exposure to waves, and establishment of littoral aquatic macrophytes. The ecology of chironomids, ephemeropteran nymphs and chaoborid larvae is discussed in detail.—Copyright 1973, Biological Abstracts, Inc.

FISHERY SURVEY CARRIED OUT AT LAKE BORULLUS, A. R. E., IN THE SPRING OF 1971, (IN CZECH),
Ceskoslovenska Akademie Ved, Brno. Ustav pro Vyzkum Obratlovcu.
J. Libosvarsky, S. Lusk, and H. Mohamed El-Sedfy.
Prirodeved Pr Ustavu Cesk Akad Ved Brne. Vol 6, No 7, p 1-41. 1972. Illus.
Identifiers: Atherina-mochon, Cichlids, Clarias-lazera, *Fishery survey, Lakes, Mugil-capito, Mugil-cephalus, Solea-solea, Spring, Survey, Fish catch, *Lake Borullus(A.R.E.), *Nile Delta.

A joint research program was carried out at Lake Borullus, 1 of the coastal lakes of the Nile Delta. Of 29 fish species caught; 6 were marine, 6 were diadromous species, 4 belong to brackish water inhabitants, 12 were Nile fishes and 1 was an introduced species. The catch per unit of effort in the spring was checked both by test fishing and via inspections of bags of commercial fishermen. With trammel nets the catch per unit of effort varied from 2 individuals of fish and 49 g of fish flesh (in daytime settings) to 14 individuals and 235 g (in overnight settings). Trammel net adapted for beach seining yielded 16 individuals and 206 g. The beach seining for fry returned 126 individuals and 210 g of fish/haul. The bodies of 3 spp of grey mullets, Solea solea, Clarias lazera and Atherina mochon, analyzed for dry matter, fat and ash contents and caloric value of 1 g dry matter showed higher nutritive value (over 5000 cal) than the bodies of cichlids (between 4 and 5000 cal). The length distributions in catches supported by scale readings show that, in spring, the population of Mugil cephalus consisted largely of 1 group (the youngs-of-the-year), while the population of M. capito was formed mainly by 2 age groups (the youngs-of-the-year and the age class I). Thus the exploitation was rather heavy and reproduction lay on the first spawning fish. Nevertheless, the large amount of fry of both species found over large areas of the lake indicated that the populations still existed on a sustained basis.--Copyright 1973, Biological Abstracts, Inc.

SUBGLACIAL DEVELOPMENT OF CHLORELLA IN BAIKAL, (IN RUSSIAN),
Irkutskii Gosudarstvennyi Universitet (USSR).
G. F. Zagorenko.
Dokl Akad Nauk SSSR Ser Biol. Vol 206, No 5, p 1223-1225. 1972. Illus.
Identifiers: *Chlorella, *Lake Baikal, *Subglacial development, *USSR, Algae.

Chlorella were collected from the subglacial waters of Lake Baikal (USSR) at various depths on March 3, 15, 22, 28, 29, 1971 and 2 24-hr series of samples taken Mar 5-6 and 18-19, 1971. The quantity of Chlorella at various depths varied during the observation period from 20,000 to 190,000 cells/l. Redistribution of the population of Chlorella during the 24-hr period was not observed, and its maximum number of cells was noted at a depth of 10-20 m.--Copyright 1973, Biological Abstracts, Inc.

DETAILED TIME VARIATIONS IN MEAN TEMPERATURE AND HEAT CONTENT OF SOME MADISON LAKES,
State Univ. of New York, Buffalo. Dept. of Biology.
K. M. Stewart.
Limnology and Oceanography, Vol 18, No 2, p 218-226, March, 1973. 4 fig, 1 tab, 28 ref.

Descriptors: Limnology, *Wisconsin, *Water temperature, Lakes, Climatology, Thermal properties, Lake morphometry, On-site data collections, Seasonal, Fluctuations, Annual, Diurnal, Sampling, Thermal pollution, *Heat budget, Water pollution, Data collections, Equilibrium, *Time series analysis.
Identifiers: *Lake Mendota(Wis), Heat content, *Lake Monona(Wis), *Lake Waubesa(Wis).

Detailed variations in mean temperature and heat content were studied for 5 years in Lake Mendota and 3 years in Lakes Monona, and Waubesa near Madison, Wisconsin. The data show that heat content may vary significantly within 2 or 3 days and that the specific time of maximum heat content is unpredictable. Accurate determinations of heat budgets require frequent sampling over long periods. A Birgean annual heat budget may not necessarily reflect the influence of a lake on the surrounding environment. Thermal discharges had little influence in determining the mean temperatures of Lake Monana. (Jerome-Vanderbilt)

THE THERMAL REGIME OF LAKE LANAO (PHILIPPINES) AND ITS THEORETICAL IMPLICATIONS FOR TROPICAL LAKES,
Indiana Univ., Bloomington. Dept. of Zoology.
W. M. Lewis, Jr.
Limnology and Oceanography, Vol 18, No 2, p 200-217, March 1973, 14 fig, 1 tab, 27 ref.

Descriptors: *Limnology, *Lake morphology, *Thermal stratification, *Water temperature, Lakes, Tropical regions, Climatology, Thermal properties, Thermocline, Seasonal, Turbulence, Mixing, On-site data collections, Analytical techniques, Heat budget, Winds, Hypolimnion, Air temperature.
Identifiers: *Thermal inversion, *Philippines(Lake Lanao).

A study of temperature records, climatic profiles, and chemical data over 14 months for Lake Lanao, a low altitude tropical lake, shows that the annual pattern of heat distribution depends partly on a seasonal air temperature minimum and partly on nonseasonal climatic changes. The lake circulated during January and February at the time of seasonal cooling, was intermittently stable during March and April and was stratified during all other months. During stratification the principal thermocline achieved equilbrium with storm winds at 40-50 m. Secondary and tertiary thermoclines repeatedly split the epilimnion into an upper turbulent layer and a lower stagnant layer for periods of up to 2 months, but were displaced or dissipated at irregular intervals by storms. Changes in the shape of the thermal profile in the lake included sharpening of thermoclines by wind and convection, smearing of thermoclines by internal water movements, unstable thermal inversions due to surface cooling, and stable thermal inversions on the bottom resulting from heat retention during cool months. (Jerome-Vanderbilt)

CHIRONOMIDAE (DIPTERA) FROM THE AREA OF FREIBURG IN BREISGAU (WITH SPECIAL CONSIDERATION OF THE GENUS CHIRONOMUS), (IN GERMAN),
Freiburg Univ. (West Germany).
E. Krieger-Wolff, and W. Wuelker.
Beitr Naturkd Forsch Suedwestdtsch. Vol 30, No 2, p 133-145. 1971. Illus.
Identifiers: Chironomidae, *Chironomus spp, Chironomus-Dorsalis, Chironomus-Luridus, Chironomus-Melanotus, *Diptera, *Germany(Freiburg-im-Breisgraw).

Over 50 chironomid species reported in the literature for southern Black Forest region (West Germany) are listed with author and location of find. Chironomus from the Black Forest and Rhine lowlands (15 spp.), determined by chromosome analysis, are briefly discussed and their localities are listed. C. luridus was most frequent in the pools of the area, followed by C. melanotus. C. dorsalis has adapted to life in temporary waters (puddles) with the ability to withstand dessication. However, a more permanent body of water to serve as a reservoir in case of long drought occurred near each find. With remarkable regularity 3 different Chironomus species were found in equal abundance at the small pools. These species may undergo temporally different population development so that total competition did not occur.--Copyright 1973, Biological Abstracts, Inc.

A REPORT ON THE LIMNOLOGY OF MONROE RESERVOIR, INDIANA,
Indiana Univ., Bloomington. School of Public and Environmental Affairs.
B. R. Allanson, C. J. Zimmerman, and D. K. Smith.
Occasional Papers, No 1, January 1973. 53 p, 12 fig, 15 tab, 18 ref.

Descriptors: *Limnology, *Reservoirs, *Indiana, Water quality, Water analysis, Physicochemical properties, Lake morphology, Aquatic life, Ecosystems, Water temperature, Biological properties, Data collections, Reviews, Water quality control, Water utilization.
Identifiers: *Monroe Reservoir(Ind).

Monroe Reservoir was established in Indiana in 1964-65 by damming the flow of Salt Creek, resulting in the biggest manmade lake in Indiana. It has become an important recreation center for the State, quite apart from its resource as a water supply for the town of Bloomington and associated industry. Because of its obvious importance to the State, the reservoir should be retained in as acceptable condition as possible. To accomplish this, much serious effort by all the users, both private and state, will be required to carry out an effective program of water quality control. To provide a basis for future comparisons, all existing knowledge about the limnology of the reservoir, including some new information, is presented. Data tabulated or illustrated include sampling sites, temperature profiles, oxygen profiles, lake bottom profiles, specific conductance, hydrogen ion concentrations, phosphorus content, nitrogen content, eutrophication, zooplankton densities, and bacterial populations. During 1968 and 1971, maximum Secchi disc transparencies occurred in late August-early September in both years. Transparency also increased toward the dam during 1971 and was lowest in the North and Middle Forks. (Woodard-USGS)

ECOLOGY AND BIOCOENOLOGY OF LAGUNAS OR LAKES OF THIRD ORDER OF THE TEMPERATE NEOTROPICAL REGION (SOUTHEAST PAMPASIC REGION OF ARGENTINA), (IN SPANISH),
La Plata Univ. (Argentina). Instituto de Limnologia.
R. A. Ringuelet.
Physis (B Aires). 31(82): p 55-76, 1972, English summary.
Identifiers: Algae, *Argentina(Pampasic region), *Biocenology, Crustaceans, *Ecology, Fish, Genetics, Hydrochemistry, Hydrophytes, Lagunas, Lakes, Neotropical regions, Plankton, Rotifers, Temperate, Thermal stress.

A great program of limnological research was initiated in 1965 concerning 25 lagunas of the Southeast Pampasic region of Argentina. A definition of terms is followed by an explanation of genetic processes and a summary of geomorphic characteristics and the thermal budget. Hydrochemically the 'lagunas' are classified according to their salinity and ionic composition, recalling the most marked annual fluctuations. Information about phytoplankton and zooplankton, with numerical data is presented. The plankton is an 'Eulimnoplankton,' frequently with adventitious elements; the zooplankton is dominated by nauplii or ritifers; the annual variations show 2 peaks, in autumn and in spring; the winter minimum is moderated and ecological factors permit the reproduction of algae and animals. There are 2 plankton types, oligohaline and mesohaline, with rotifers and microcrustacean indictors. An account of the mesofauna from euplenston, bafon and benthos is given, as well as data on hydrophytes, numerosity and biomass. Population studies on fishes reveal that a typical 'laguna,' such as Chascomus, has 16 spp., each computed in numbers and biomasses. The silverside of 'pejerrey' has a strict relation with size of microcrustaceans of the plankton, and the yield of planktonic fishes of 'lagunas' varies accordingly. There are 2 general types of 'lagunas,' characterized by their chemical composition, hydrophytes and plankton, whose successions are very different (halitrophic and saprotrophic types) in relation with the regional climatic factors.--Copyright 1973, Biological Abstracts, Inc.

WAVE INTERACTION AND LANGMUIR CIRCULATIONS,
State Univ. of New York, Albany. Atmospheric Sciences Research Center.
In: Physical Studies on Lake George and Lake Ontario, Lake George Studies Report No 6: State University of New York Atmospheric Sciences Research Center Publication No 147, p 496-499, June 1971. 2 fig, 15 ref. (Reprinted from Proc of 11th Conference on Great Lakes Research, 1968.).

Descriptors: *Currents(Water), *Waves(Water), *Limnology, Lakes, Water circulation, Refraction(Water waves).
Identifiers: *Langmuir circulation, *Waves interference(Water).

The interaction of two trochoidal wave trains was examined numerically to compare the computed wave shapes and locations to the observation of streaking associated with Langmuir circulations. The wave trains approach each other at angles of 15, 20 and 25 deg. The resulting areas of maximum amplitude form apparent streaks and move across the field of vision, similar to the motion of streaks associated with Langmuir circulations. (Knapp-USGS)
W74-04844

A FIELD STUDY OF LANGMUIR CIRCULATIONS,
State Univ. of New York, Albany.
G. E. Myer.
In: Physical Studies on Lake George and Lake Ontario: Lake George Studies Report No 6: State University of New York Atmospheric Sciences Research Center Publication No 147, p 652-663, June 1971. 11 fig, 1 tab, 21 ref. (Reprinted from Proc of 12th Conference on Great Lakes Research, 1969).

Descriptors: *Waves(Water), *Currents(Water), *Water circulation, Lakes, Limnology, Winds, *New York.
Identifiers: *Langmuir circulation, *Lake George(NY).

Under thermally stable conditions Langmuir circulations transport heat downward. Langmuir circulations are a major cause of epilimnion mixing and thermocline development and decline in lakes. The Langmuir circulations appear to be coupled to the wind by some indirect mechanism. The mechanisms for this coupling which best fit field observations on Lake George, New York, are those acting as or very near the water surface. (Knapp-USGS)

2I. Water In Plants

CHANGES IN ENZYMES IN THE PLANT AS RELATED TO WATER SUPPLY AND USAGE,
California Univ., Davis. Dept. of Water Science and Engineering.
T. C. Hsiao, and R. C. Huffaker.
Available from National Technical Information Service as PB-228 634, $4.00 in paper copy. Completion Report, UCAL-WRC-70-W131, March, 1970. 8 p, 14 ref. OWRR B-029-CAL(1).

Descriptors: *Enzymes, *Metabolism, Photsynthesis, Nitrogen, *Drought resistance, *Stomata, *Moisture stress, Plant physiology.
Identifiers: Starch degradation.

The ultimate objective is to determine the mechanisms or controlling factors which regulate the adaption of plants to conditions where water is limiting. The immediate objectives have been (1) to determine the effects of water deficit on enzymes required for the important biochemical processes of nitrogen metabolism, photosynthesis, and starch degradation; (2) to relate changes in these processes caused by water stress to the growth of the plant and to its adaptation to drought; and (3) to study the control governing the opening and closing of stomata, the pores which regulate water loss from plants.

CONCERNING LARGE-SCALE CULTIVATION OF THERMOPHILIC COSMOPOLITAN MASTIGOCLADUS LAMINOUSUS COHN (CYANOPHYTA) IN ICELANDIC HOT SPRINGS,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Institut fuer Molekularbiologie und Biophysik.
A. Binder, P. Locher, and H. Zuber.
Arch Hydrobiol. Vol 70, No 4, p 451-555, 1972. Illus. English summary.
Identifiers: Chemistry, Cultivation, *Cyanophyta, Flow, *Iceland, *Mastigocladus-Laminosus, Temperature, *Thermophilic animals, *Algae, Hydrogen ion concentration, Hot Springs.

M. laminosus Cohn was found in great quantities in several Icelandic hot springs. The effects of pH, temperature, chemical composition and flow-speed of the water on growth of the organism were studied, and the optimum conditions for cultivation were determined. Based on these results a 5 m long flow-through channel was built in which to cultivate the algae.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Lumber, *Moisture content, *Moisture uptake, *Vascular tissues, *Humidity, *Hygroscopic water, Vapor pressure, Thermodynamics, Thermodynamic behavior, Water properties, Water types, Moisture tension, Water vapor, Absorption, Adsorption, Capillary water, Porosity, Permeability, Evaporation, Osmotic pressure.
Identifiers: *Wood, Moisture equilibria, Dimensional stability, Swelling.

This fundamental text on wood-water relationships provides a unified theoretical treatment of all important physical phenomena relating to te behavior of wood in response to changes in moisture content. The five chapters deal with the following topics: Physics of water (vapor pressure, capillary and osmotic pressure, evaporation, freezing, sublimation, etc.); Wood moisture and the environment (hydrogen bonding, water sorption, moisture content and measurement, processing effect on wood moisture, etc.); Hygroscopic shrinkage and swelling (dimensional stability, anisotropy, etc.); Thermodynamics of moisture sorption (heats of sorption and of wetting, swelling pressure, thermo- and hygroelasticities, etc.); and Theories of water sorption proposed by various researchers to explain the equilibrium moisture content of wood in relation to atmospheric conditions. A subject index is appended. (Brown-IPC)

OBSERVATIONS ON THE VEGETATION OF THE KORONOWO RESERVOIR,
Nicolas Copernicus Univ. of Torun (Poland). Inst. of Biology.
K. Kepczynski, and M. Ceynowa-Gieldon.
Stud Soc Sci Torun Sect D (Bot). Vol 9, No 4, p 1-68. 1972. Illus.
Identifiers: Alder, Bidens-cernuus, Bidens-connatus, Bidens-melanocarpus, Ceratophyllum-demersum, Ceratophyllum-submersum, Elodea-canadensis, Flooding, Heleocharis-palustris, *Poland(Koronowo reservoir), Potamogeton-natans, Reservoirs, *Succession(Plants), *Swamps, *Vegetation.

The occurrence and succession of plants in the Koronowo reservoir area (Poland) after the construction of the dam on the Brda River in 1959 was observed. The initial flooding produced numerous small pools in nearby forests, meadows and cultivated fields. Shortly after the flooding, floating islands occurred in the reservoir which were the result of loosening of the flooded peat bogs, alder swamps and lowland forests. The plants of these islands made up the major source of distribution of swamp, reed and bush plants. The major pools

were first settled by water plants, so that in the first yr after construction of the dam Elodea canadensis, Ceratophyllum demersum, C. submersum, Potamogeton natans and other water plants previously only known to occur in the Brda River bed were observed in these pools. On the banks of the reservoir first swamp vegetation, then after some years, reeds occurred. In the isolated small pools in the forests, swamp plants, most significantly Bidens cernuus, appeared first, followed by reeds and aquatic plants. Present vegetation is species-poor spotty. Typical plant associations were lacking in the reservoir; most of the present stands have transitional character. A total 558 spp. were collected in the reservoir and on its banks. B. connatus and B. melanocarpus were first found in this area after construction of the dam. The most important associations of the reservoir area are at present the Myriophyllo-Nupharetum in its initial stage, the Sagittario-Sparaganietum, Scirpo-Phragmitetum and Glycerietum aquaticae and stands containing P. natans, Heleocharis palustris and B. cernuus.--Copyright 1973, Biological Abstracts, Inc.

DAILY DIET AND RATE OF FEEDING OF NOTOTHENIA ROSSI MARMORATA FISCHER AND DISSOSTICHUS ELEGINOIDES SMITT, FAMILY NOTOTHENIDAE, IN THE AREA OF SOUTHERN GEORGIA (USSR), (IN RUSSIAN),
All-Union Research Inst. of Marine Fisheries and Oceanography, Moscow (USSR).
M. I. Tarverdieva.
Vopr Ikhtiol. Vol 12, No 4, p 748-756. 1972. Illus.
Identifiers: Ctenophora, *Daily diet, *Dissostichus-Eleginoides, Euphausia-Superba, Fish, *Notothenia-Rossi-Marmorata, Nototheniidae, *USSR(Georgia), Feeding rate.

In March 1971, the basic food of N. rossi marmorata was Ctenophora, that of D. eleginoides was fish. During this period, feeding increased during the second half of the day and decreased in the morning. N. rossi consumed intensively for 15 hr, D. eleginoides for 19 hr with breaks of 13 and 10 hr, respectively. In May, when N. rossi consumed Euphausia superba, feeding increased at about 11:00 a.m. and decreased at about 4:00 p.m. The daily ration was computed by 2 methods.--Copyright 1973, Biological Abstracts, Inc.

CONTRIBUTION TO KNOWLEDGE ABOUT THE LEAF ANATOMY OF SPECIES OF A 'CAATINGA' OF THE RIO NEGRO (AMAZON), (IN PORTUGUESE),
Sao Paulo Univ. (Brazil). Inst. of Bio-Sciences.
B. L. DeMorretes, and M. G. Ferri.
Rek Biol (Lisb). Vol 8, No 1-4, p 97-122. 1972. Illus. (English summary).
Identifiers: *Amazon region(Rio Negro), Bactris-cuspidata, *Caatinga, Clusia-spathulaefolia, Compsoneura-debilis, *Leaf, Oligotrophic, Pagamea-coriacea, Retiniphyllum-truncatum, Scleromorpism, Sphaeradenia-amazonica, *Evergreen scrubs.

A 'caatinga' is a type of low scrubby evergreen forest on local areas of white sand. Species treated are Bactris cuspidata Mart., Clusia spathulaefolia Engl., Compsoneura debilis Warb., Pagamea coriacea Spruce, Retiniphyllum truncatum Mull. Arg. and Sphaeradenia amazonica Harling. The yearly rainfall in the region may be more than 4000 mm and there is hardly a month with less than 100 mm. Average temperatures and relative humidity are high. Soils are generally very sandy and poor. Several structures that are usually considered xeromorphic features are described: thick cuticle and cuticular layers, water-storing tissues, stomates in depressions, mechanical tissues, etc. The idea of oligotrophic scleromorphism presented by several authors in connection with other types of vegetation, such as the 'cerrado' which grows in places where soil water is not lacking but the soils are also in general very poor, is supported.--Copyright 1973, Biological Abstracts, Inc.
W74-04682

BOG VEGETATION RE-MAPPED AFTER SIXTY YEARS: STUDIES ON SKAGERSHULTAMOSSEN, CENTRAL SWEDEN,
I. Backeus.
Oikos. Vol 23, No 3, p 384-393. 1972. Illus.
Identifiers: *Bogs, *Sweden(Skagershultamossen), *Vegetation, Mapping.

Two areas were mapped. The new maps were compared with maps of the same areas from 1910, made by L. von Post. The vegetation changes are small. The open water surfaces have diminished in number and extent. The theory of cyclic succession on peat bogs finds no support from the maps. Plant communities have been delimited to correspond to those on the old maps and defined through analysis of a number of sample plots.--Copyright 1973, Biological Abstracts, Inc.

AEDES AEGYPTI AND AEDES SIMPSONI BREEDING IN CORAL ROCK HOLES ON THE COAST OF TANZANIA,
World Health Organization, Dar es Salaam (Tanzania). East African Aedes Research Unit.
M. Trpis, W. K. Hartberg, C. Teesdale, and G. A. H. McClelland.
Bull W H O. Vol 45, No 4, p 529-531. 1971.
Identifiers: *Aedes-aegypti, *Aedes-simpsoni, *Africa(Tanzania), Axils, Banana, Breeding, Coast, Coconut, Colocasia, Coral, Holes, Pineapple, Rock, Sheels, Snail, Tree.

Breeding sites of A. aegypti in East Africa can be generally divided into 2 groups: breeding places associated with man, i.e., indoor and outdoor breeding in artificial containers (water-pots, discarded tins, tires, bottles, barrels, buckets, glass jars, etc); and natural breeding places (tree holes, coconut shells, snail shells, sometimes plant axils, and rock holes). Wiseman et al. (1939) recorded A. aegypti breeding holes in coral on the Kenya coast near Mombasa. Since the East African coast is relatively uniform, it is probable that these holes were identical to those observed during the present study. An extensive survey of the coast would probably indicate that A. aegypti breed wherever there are elevated coral outcorps. In view of the abundance of both A. aegypti and A. simpsoni on the uninhabitad Bongoyo Island, those on Msasani peninsula should probably be regarded as relict forest populations rather than indicating any invasion of an uncharacteristic habitat. A. simpsoni is generally regarded as a species that breeds in the leaf axils of plants. The present work in Tanzania indicates that the breeding sites of A. simpsoni are pineapple axils, colocasia, certain bananas, tree holes, coral holes, and snail shells, in order of preference. A. simpsoni is also known to breed frequently in manmade containers in South Africa (Muspratt, 1965). The coral rock holes on the Msasani peninsula near Dar es Salaam, Tanzania, are considered to be the newly-recorded breeding sites of A. simpsoni.--Copyright 1973, Biological Abstracts, Inc.

THE PHYTOPLANKTON PRODUCTIVITY IN THE PYASINA RIVER NEAR TAREYA VILLAGE (WESTERN TAIMYR), (IN RUSSIAN),
Akademiya Nauk SSSR, Novosibirsk.
V. I. Ermolaev.
Gidrobiol Zh. Vol 8, No 6, p 97-100. 1972.
Identifiers: *Asterionella-formosa, Melosira, *Phytoplankton, *Productivity, Pyasina river, *USSR(Taimyr).

The productivity of phytoplankton in the Pyasina river near Tareya village (USSR) was studied. Samples of water were filtered through no 6 filter paper and subjected to quantitative tests of the intensity of plankton photosynthesis in phials with oxygenation modification. The quantity of algae reached 1.5 mill kl/l of water, bomass 1.017 mg/l and photosynthetic intensity 0.56 mgO2/l day. Fifty species were found of which Asterionella formosa Hass and species of Melosira were most common.--Copyright 1973, Biological Abstracts, Inc.

CHANGES IN THE AVIFAUNA OF THE BIESBOSCH IN THE 1ST YR AFTER THE ELIMINATION OF THE TIDE,
D. Fey, and T. Lebret.
Limosa. Vol 45, No 3/4, p 101-118. 1972. Illus. (English summary).
Identifiers: *Avi fauna, Bluethroat, Breeding, Coot, Crested, Cyanosylvia-suecica, Fulica-atra, Grebe, *Netherlands(Biesbosch), Panurus-biarmicus, Platalea-leucoradia, Podiceps-cristatus, Reeds, Sluices, Spoonbill, Teal, *Tideal mud flats.

Until Nov. 1970 the Biesbosch, Netherlands, was a freshwater tidal delta area. The Rhine and Meuse rivers meet here. The area is 32 km southeast of Rotterdam. The tidal amplitude was some 2 m. In Nov., 1970 a system of sluices was put into action, and the tidal span was reduced to 0.20 m. The high level of the new situation is 0.60 m below the original high tide level. Some 65-75% of the former tidal mud flat is permanently water covered now. Changes in the vegetation and in numbers of bird species are described. Teal (Anas crecca) numbered 10,000-15,000 birds in former days. Their numbers were greatly reduced after elimination of the tide. The great crested grebe (Podiceps cristatus) has started to breed. Spoon-bills (Platalea leucorodia) are present in considerable numbers. Coots (Fulica atra) increased as breeding birds. They reduced the extension of the reeds, which eventually may be a positive factor. Low nestling species bluethroat (Cyanosylvia svecica) and bearded tit (Panurus biarmicus) increased in the former tidal reed beds, but soon will lose their habitat because the reed beds are permanently dry and will develop into scrub.--Copyright 1973, Biological Abstracts, Inc.

SYNGNATHUS NIGROLINEATUS NIGROLINEATUS (EICHWALD) IN THE FRASINET RIVER AND MOSTISTEA LAKE, (IN RUMANIAN),
R. Giurca, and M. Olaru.
Bul Cercet Piscic. Vol 31, No 1/2, p 91-93. 1972. Illus. (English summary).
Identifiers: Frasinet, Lakes, Mostistea, Parasites, Records, *Reproduction, River, *Romania, Syngnathus-nigrolineatus-nigrolineatus, *Lophobtanchiate, Fish foods.

Occurrence was noted, for the first time, in the lake Mostistea and the river Frasinet (Romania) of the lophobtanchiate S. nigrolineatus nigrolineatus. Some biometrical and general data are presented. The average length was 134 mm for males and 125 mm for females; average weight 2 g; number of eggs laid in the male's hatching purse 100; the eggs diameter 1.5-1.7 mm. Some aspects related to food and the parasites of the fish, in the environmental conditions of the respective ecosystems are discussed.--Copyright 1973, Biological Abstracts, Inc.

TYPES OF DISTRIBUTION PATTERN AMONG FRESHWATER ANIMALS, (IN RUMANIAN),
Academia R. S. R., Bucharest (Rumania). Institutul de Biologie.
P. Banarescu.
Rev Roum Biol Ser Zool. 17(1): p 23-30. 1972.
Identifiers: Anostraca, Crustacea, *Distribution patterns, Fish, Insects, Mites, Mollusks, *Aquatic animals.

The main types of distribution pattern recognized among epigeous fresh-water animals are: primary aquatic animals (fishes, higher crustaceans, mollusks) whose ranges depend mainly on river drainages; inhabitants of temporary pools with restricted range (the most important group being the Anostraca) whose ranges depend on climatic zones; insects and water mites, of terrestrial origin; the range of the rheophilic ones depend mainly on mountain ranges. Many hypogeous animals, both of marine and of fresh-water origin, seem to have retained the range of colonization of subterranean waters, in spite of the old age of many of them.--Copyright 1973, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

GROWTH OF LONGSHORE CURRENTS DOWNSTREAM OF A SURF-ZONE BARRIER,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
P. S. Eagleson.
In: Coastal Engineering Santa Barbara Specialty Conference, American Society of Civil Engineers, October 1965, Chap 20, p 487-507, 1966. 6 fig, 9 ref. DA-49-005-CIV-ENG-62-9.

Descriptors: *Sediment transport, *Beaches, Coasts, Model studies, *Currents(Water), *Waves(Water), Equations.
Identifiers: Longshore currents, Surf zone, Momentum flux.

Momentum flux considerations are used to formulate a differential equation governing the growth, with distance, of the mean longshore current velocity in the surf-zone on a plane, impermeable beach due to monochromatic waves. The equation is solved for the flow situation downstream of a surf-zone barrier and is shown to compare favorably with laboratory measurements. The asymptotic (uniform flow) form of the relation is also shown to be in good agreement with the field and laboratory data of other investigators. Conclusions are reached governing the size of laboratory models necessary to represent conditions of fully developed longshore currents. A thorough understanding of the mechanics of sand transportation parallel to coasts must ultimately be based upon detailed knowledge of the complicated fluid motions which occur within the surf zone. This work is devoted to the formulation and evaluation of a rational analytical model for the prediction of mean longshore current velocity as a function of beach and wave parameters. (Sinha-OEIS)

MEAN DIRECTION OF WAVES AND OF WAVE ENERGY,
Leeds, Hill and Jewett Inc., Los Angeles, Calif.
O. J. Lillevang.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 86, No WW1, Proceedings paper No. 2423, p 123-143, March 1960. 11 fig, 2 tab.

Descriptors: *California, *Coasts, *Beach erosion, Harbors, Waves(Water), *Coastal structures, *Beaches, Shoals, *Refraction(Water waves), Breakwaters.
Identifiers: *Shoaling, *Wave energy, Santa Barbara(Calif.).

Reliable predictions of erosion/accretion effects of new coastal works are necessary. A vector technique related to wave direction and duration statistics is devised, tested on Santa Barbara historical shoaling records and demonstrated as a design aid for a small craft harbor plan on a sandy reach of California coast. The configurations of sand deposits which occur as the result of wave action, or because of the interception of wave action, must be related to the direction of wave motion at the locality. Waves expend work which is applied in the direction of the motion of water particles within the waves. It is hypothesized that in mature shoals and beaches their outline will bear a distinguishable relationship to the mean direction of all wave energy which has been applied at that location. If this hypothesis is acceptable, the first need becomes a consistently reproducible definition of the mean direction of wave energy at a specific location from basic data. (Sinha-OEIS)

THE RELATIONSHIP BETWEEN WAVE ACTION AND BEACH PROFILE CHARACTERISTICS,
University Coll., London (England). Dept. of Civil Engineering.
P. H. Kemp.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, the Engineering Foundation, Vol 1, Chap 14, p 262-277, 1961. 5 fig, 12 ref.

Descriptors: *Hydraulic models, *Sediment transport, Beaches, Profiles, Particle size, *Beach erosion, *Waves(Water), *Shore protection, Profiles, Sands.
Identifiers: Breakers, Wave action, Beach cusps, Wave steepness, Phase difference, Shingle.

The results of a series of preliminary hydraulic model experiments carried out prior to a model study of the behavior of groynes in stabilizing beaches are described. Most of the beach materials used represented coarse sand or shingle in nature. The results demonstrate the fundamental importance of the 'phase-difference' in terms of wave period between the break-point and the limit of uprush, in relation to flow conditions, cusp formation, and the change from 'step' to 'bar' profiles. Within the limits of the experiments an expression connecting the breaker height, beach profile length, and grain diameter is developed, and its implications examined in relation to beach slope, and to the previous 'wave steepness' criterion for the change from step to bar type profiles. Observations are included on the rate of recession of a shoreline due to the onset of more severe wave conditions. (Sinha-OEIS)
W74-04331

LITTORAL TRANSPORT IN THE GREAT LAKES,
United States Lake Survey, Detroit, Mich.
L. Bajorunas.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, the Engineering Foundation, Vol 1, Chap 20, p 326-341, 1961. 12 fig, 1 tab, 8 ref.

Descriptors: *Littoral drift, *Sediment transport, *Great Lakes, *Waves(Water), *Beach erosion, Equations, *Currents(Water), Lakes.
Identifiers: Wave energy, Littoral processes.

Littoral transport has been defined as the movement of material along the shore in the littoral zone by waves and currents. The material thus transported is referred to as the littoral drift. The littoral drift originates from the beach material being picked up by the water and transported along the shore and deposited in another location. Shore erosion, littoral transport, and deposition of drift are all factors in the littoral process. An analysis is presented of the littoral transport in the Great Lakes. A derivation of the transport equation and observational data on specific localities also are presented. Wave energy is the prime factor of littoral transport. The general circulatory currents and the currents resulting from water level disturbances do not significantly change the picture of the energy in the littoral zone of the Great Lakes. These currents might be a factor in some isolated or restricted areas. (Sinha-OEIS)
W74-04334

WAVE EFFECT ON THE COAST FORMATION AND EROSION,
Construction Engineering Inst., Warsaw (Poland).
W. Jarocki.
In Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, the Engineering Foundation, Vol 1, Chap 12, p 203-210, 1961. 6 fig, 4 ref.

Descriptors: Suspended load, Bottom sediment, Littoral, Coasts, *Beach erosion, Deposition(Sediments), *Waves(Water), *Tidal effects, Currents(Water), Measurement, *Shallow water, Instrumentation, *Sediment transport.
Identifiers: Nearshore, *Wind waves, Wave action.

Findings are summarized on the kind of sediment moved by waves, the effect of water depth on that movement, and factors of wave action in erosion and accretion of the coast. Information is given on instruments used in field and laboratory studies of sediments and their measurement. (Sinha-OEIS)
W74-04335

THEORETICAL FORMS OF SHORELINES,
Rijkswaterstaat-Deltadienst, The Hague (Netherlands). Coastal Research Dept.
W. Grijm.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, the Engineering Foundation, Vol 1, Chap 11, p 197-202, 1961. 5 fig, 3 ref.

Descriptors: *Shores, Coasts, Rivers, *Waves(Water), Equations, Mathematics, *Littoral, *Sediment transport.

Identifiers: *Shorelines, Littoral transport.

The mathematical treatment of factors involved in littoral processes is discussed. Conditions are idealized as littoral transport by waves only, unvarying wave characteristics, and a simple relation between the angle of wave approach and the littoral transport. Also important is the consideration of the quantity of material transported by the river to the sea. (Sinha-OEIS)

RATES OF MASS WASTING IN THE RUBY RANGE, YUKON TERRITORY,
Portland State Univ., Oreg.
L. W. Price.
In: International Conference on Permafrost, Yakutsk, USSR, 1973. p 235-245, 1973. 9 fig, 3 tab, 17 ref.

Descriptors: *Mass wasting, *Solifluction, *Erosion rates, *Degradation(Slope), Permafrost, Arctic, *Canada, Soil erosion, Slopes.
Identifiers: *Ruby Mountains(Canada).

Measurements of mass wasting were carried out during the summers of 1967, 1968 and 1972 in the Ruby Range, Yukon Territory, Canada. The rates of mass wasting in the Ruby Range are in general 1-3 cm per yr less than those recorded for other solifluctional areas. The lower rates in the Ruby Range may be partially due to the fact that many of the measurements were made on large solifluctional terraces with a complete vegetation cover, whereas many of the measurements from other areas were made on individual lobes. DYNAMICS AND MORPHOLOGY OF SEA COASTS.
National Science Foundation, Washington, D.C. Special Foreign Currency Science Information Program.
Available from NTIS as TT-68-50355, for $6.00 paper copy, $1.45 microfiche. TT-68-50355 1969. 371 p. Translation of Dinamika i Mopfologiya Morskikh Beregov, Trudy Instituta Okeandlogii, Akademii Nauk SSR, Vol 48, 1961.

Descriptors: *Sedimentation, Geomorphology, Geologic history, *Waves(Water), *Currents(Water), Reviews, *Beach erosion, Sand spits, *Sand bars, *Lagoons, *Bays, Translations.
Identifiers: Books, Eustacy, Marine transgressions.

The dynamics and morphology of sea coasts is the subject of this collection of sixteen papers. Titles included are: Some Results of Regional Coastal Investigations in the USSR; History of the Formation of the Coasts of Kara-Bogaz-Gol; Developmental History and Present-Day Dynamics of the Chushka Spit; Some Data on the Post-Glacial Evolution of Karkinit Bay and the Accumulation of Bottom Sediments within It; Recent Development of the Temryuk Coast on the Azov Sea; Some Data on the Post-Glacial Transgression of the Bering Sea; Certain Structural and Development Coastal Features in the South of the Maritime Territory; Morphology and Evolution of a Lagoon Coast on Sakhalin; The Formation and Classification of Marine-Built Terraces on Emergent Coasts; Submarine Sand Ridges as Indicators of Longshore Migration of Sediments; Certain Aspects of the Interaction between Wave Flow and a Deformable Bottom at Low Velocities; The Possiblity of Forecasting Transient Coastal Relief Changes by Waves; The Determination of Maximum Wave Velocities in the Shore Zone of the Sea; The Effect of Wave Refraction on the Formation of an Equilibrium Profile of Submarine Coastal Slope; The Possibility of Predicting Longshore Currents in Tideless Seas; and The Role of Eolian Processes in the Dynamics of a Shallow Accumulation Coast. (See W74-04426 thru W74-04440) (Sinha - OEIS)
W74-04425

SOME RESULTS OF REGIONAL COASTAL INVESTIGATIONS IN THE USSR,
A. S. Ionin, P. A. Kaplin, and V. S. Medvedev.
In: Dynamics and Morphology of Sea Coasts, TT 68-50355, p 1-34, 1969. 6 fig, 2 tab, 86 ref. Trans. from Trudy Instituta Okeanologii, Akademii Nauk SSSR, Vol 48, 1961.

Descriptors: Coasts, *Sea level, *Estuaries, *Fjords, *Bays, *Deltas, *Waves(Water), Currents(Water), Morphology, Geomorphology, Translations.
Identifiers: *USSR, Tectonics.

The coastal dynamics and morphology of Soviet seas studied on a large scale for a period of ten years. Findings are summarized on distinctive structural and developmental characteristics of the coasts of a given sea and attention is drawn to several common features appearing ubiquitously on the coasts of all the Soviet seas. Three groups of coastal types are identified: coasts formed by subaerial and tectonic processes and little altered by the sea; coasts shaped mainly by non-wave factors; and coasts formed mainly by wave processes. It is suggested that on the whole, the post-Glacial eustatic rise in the level of the World Ocean being super-imposed on the tectonic movements of the structures of the earth's crust, exerted a tremendous influence on the formation of seaboard relief, leaving vivid traces on even tectonically mobile coasts. (See also W74-04425) (Sinha - OEIS)
W74-04426

HISTORY OF THE FORMATION OF THE COASTS OF KARA-BOGAZ-GOL,
O. K. Leont'ev.
In: Dynamics and Morphology of Sea Coasts, TT 68-50355. p 35-68, 1969. 8 fig, 27 ref. Trans. from Trudy Instituta Okeanologii, Academii Nauk SSSR, Vol 48, 1961.

Descriptors: *Geologic history, *Gulfs, *Bays, *Deltas, Quaternary period. Gemorphology, *Sea level, Translations.
Identifiers: *USSR(Caspian Sea), Tectonics.

The Kara-Bogaz-Gol is the largest inlet of the Caspian Sea. Information is presentedon the history of the formation of the coasts of this large gulf. The gemorphology and geological structures vary in different parts of the basin. An analysis of the development of the Kara-Bogaz-Gol coast and especially its bay-bar, reveals the importance of the balance of bottom sediments in the evolution of coastal accumulation forms. It is concluded that tectonic movements played practically no role in the evolution of the coastline in the Quaternary. The rapid fall of the Caspian Sea, and hence also of Kara-Bogaz-Gol after 1929 led to drastic alterations in the coastal relief and its dynamics. At present, the outer contour of the Kara-Bogaz-Gol depression and the water edge are separated by a wide expanse of salt plain, the surface of which formed by the top salt layer emerging from under the water. The coastal forms previously produced by wave processes now are beyond the reach of waves. A strait delta is the only feature being formed at present. (See also W74-04425) (Sinha - OEIS)
W74-04427

DEVELOPMENTAL HISTORY AND PRESENT-DAY DYNAMICS OF THE CHUSHKA SPIT,
V. L. Boldyrev.
In: Dynamics and Morphology of Sea Coasts, TT 68-50355. p 69-91, 1969. 5 fig, 33 ref. Trans. from Trudy Instituta Okeanologii, Akademii Nauk SSSR, Vol 48, 1961.

Descriptors: *Sediment transport, *Sand spits, Geologic history, *Bottom sediments, Bays, Coasts, *Winds, Translations.
Identifiers: Kerch Strait, *USSR(Chushka Spit), *Nearshore, Azov Sea.

The Chushka Spit situated in the north of the Kerch Strait is the only active coastal accumulation form in this area. It is 17.5 km long, and its width at the site of attachment to the bedrock coast is only 40-60 m. The spit has been developing for at least 2,500 years. During its main formation period the spit received its material from the adjacent stretch of bedrock coast undergoing vigorous abrasion, as well as from the bottom of the strait and from the south of the Azov Sea. In the comparatively Recent past, a drastic change again occurred in the trend of the coastal processes on Chushka, due to the change in its supply. The gradual straightening of the arc of Temryuk Bay by abrasion and accumulation and by the bay then filling with sediments deposited by the Kuban River, again made possible the considerable influx of sandy sediments from the bay to Chushka spit. This was facilitated by the dominant northeasterly winds, which have the largest force and duration and the highest incidence frequency. Certain signs, including the distribution of bottom sediments in the spit area, indicate progressive influx of sand to the spit also at the present time. (See also W74-04425) (Sinha - OEIS)
W74-04428

SOME DATA ON THE POST-GLACIAL EVOLUTION OF KARKINIT BAY AND THE ACCUMULATION OF BOTTOM SEDIMENTS WITHIN IT,
E. N. Nevesskii.
In: Dynamics and Morphology of Sea Coasts, TT 68-50355. p 92-110, 1969. 5 fig, 10 ref. Trans. from Trudy Instituta Okeanologii, Vol 48, 1961.

Descriptors: *Deposition(Sediments), *Sedimentation, *Erosion, Bays, Coasts, *Bottom sediments, *Shores, Translations.
Identifiers: Black Sea, *USSR(Karkinit Bay), Lobate coasts.

Karkinit Bay is the largest in the Black Sea. The bay outlines are very unusual. The abundance of sandy material gave rise to large accumulation coastal forms, causing heavy articulation of the coastline. These conditions resulted in a typical

lobate coast, which does not occur anywhere else on the Black Sea. A characteristic feature of the bottom relief in the bay is the extensive occurrence of transverse ridges mostly composed of sandy-shelly material, sometimes blanketed by sandy-silty sediments. The easternmost ridge is known as Churyumskaya bank. West of the bank lies the most distinct rise, which is the Bakalskaya bank. These are followed by two less distinct ridges, stretching from the shores of Tarkhankut Peninsula in the northwest to the opposite coast of the bay. Coastal accumulation forms, owing their sediment supply to coastal abrasion, pass through multiphase development during nonuniform transgression of the sea. They may 'die' and become restored, with a certain spatial shift depending upon the transgression rate and correspondingly upon abrasion rate for stretches of bedrock coast. Significant alterations in the coastal contour due to prolonged development of large coastal stretches may bring about final 'death' of coastal accumulation forms of a certain type, thus completing their multiphase developmental cycle. Simultaneously, the same change of coastal contour may produce conditions for the formation of other accumulation bodies, not uncommonly of other types on other coastal areas. On continuation of the nonuniform transgression, they likewise undergo multiphase development and may then disappear, having completed their cycle. (See also W74-04425) (Sinha - OEIS)
W74-04429

RECENT DEVELOPMENT OF THE TEMRYUK COAST ON THE AZOV SEA,
Yu. A. Pavlidis.
In: Dynamics and Morphology of Sea Coasts, TT 68-50335. p 111-123, 1969. 4 fig, 8 ref. Trans. from Trudy Instituta Okeanologii, Akademii Nauk SSR, Vol 48, 1961.

Descriptors: Coasts, *Sand spits, *Bottom sediments, *Bays, Sands, *Sedimentation, *Erosion, Geologic history, Translations.
Identifiers: *USSR(Azov Sea), Temryuk Coast, Nearshore processes, Kuban River.

Investigations covered the nearshore zone in the south of Temryuk Bay from Cape Akhilleon in the west to Verbyanaya spit in the east. In plan, this area is a shallow concave arc complicated by the wave-cut Akhilleon-Pekly prominence on the one side and by the protruding delta of the Kuban River on the other side. The present-day quantity of sand along the Temryuk coast is considerably larger than it was in the Recent past. The 1954 survey of bottom sediments performed by staff members of the Black Sea Experimental Research Station of the Institute of Oceanology of the Academy of Sciences of the USSR and the data obtained with a vibrating piston corer in 1958 show that at the present time sand forms a continuous belt on the nearshore bottom. The sand descends downslope to depths of 7 m, having an average thickness of some 1.5m in the Kuchugury-Golubitskaya area. The sand belt becomes somewhat wider opposite Peresyp, possibly due to the transport of sandy material through the Peresyp Strait. The thickness of sandy sediments is considerably larger on the east of the Kuban delta than on the west. (See also W74-04425) (Sinha - OEIS)
W74-04430

SOME DATA ON THE POST-GLACIAL TRANSGRESSION OF THE BERING SEA,
F. A. Shcherbakov.
In: Dynamics and Morphology of Sea Coasts, TT 68-50355. p 124-131, 1969. 4 fig, 11 ref. Trans. from Trudy Instituta Okeanologii Akademiya Nauk SSSR. Vol 48, 1961.

Descriptors: *Geologic history, *Sea level, *Sedimentation, *Erosion, *Deposition(Sediments), Costs, Translations.
Identifiers: Eustacy, Post glacial transgression, *Bering Sea, Black Sea.

Findings are compared with data on Recent past - Glacial transgression of the Black Sea. A comparison of data for the Black and the Bering Seas suggests that in both cases certain structural features of the submarine coastal slope occur at depths of 10 m. These features are apparently related to common causes, namely to the intermittent eustatic fluctuations of sea level during the post-Glacial transgression of the World Ocean. The question arises as to whether a relationship exists between the rate of sea level and that of the coastal processes. When the submarine relics of coastal accumulation forms in the Bering Sea were discussed., it was pointed out that their formation was related to a certain slowing down of transgression or even to a stabilization of sea level. However, it was most probably not a complete stabilization, but just a decrease in the rate of rise in sea level, when the latter reached a certain measure of equilibrium with the rate of coastal processes. The relationship between the rate and duration of changes in sea level on the one hand and the intensity of the effect of the coast-forming processes on the seaboard, on the other hand, is very important for reconstructing the history of coastal development. W74-04431

CERTAIN STRUCTURAL AND DEVELOPMENTAL COASTAL FEATURES IN THE SOUTH OF THE MARITIME TERRITORY,
V. S. Medvedev, Y. S. Dolotov, and F. A. Shcherbakov.
In: Dynamics and Morphology of Sea Coasts, TT-68-50355. p 132-156, 1969. 11 fig, 38 ref. Trans. from Trudy Instituta Okeanologii Akademiya Nauk SSSR. Vol 48, 1961.

Descriptors: Geologic history, Coasts, *Bays, *Inlets(Waterways), Geomorphology, *Sedimentation, *Alluvium, Translations.
Identifiers: Geologic structures, Coastal uplift, USSR, Maritime Territory.

The coastline of the southern Maritime Territory west of Cape Povorotnyi and farther south to the boundary with North Korea is some 500 km long. The most characteristic feature of this seaboard is the complex indentation of its coastline. The coast is indented by numerous bays and inlets over its entire length, the Amur and Ussuri bays penetrating 50-70 km into the land. Other large bays are America, Voltok, Strelok, Slavyanskii, Poseta, etc. Such a complex coastal indentation is closely related to the geological structure of the region and depends primarily upon the strike and the combination of the major geological structures. The coasts of the southern Maritime Territory are comparatively young geomorphologically. Analysis of the coastal relief shows that the dominant role in the supply of accumulation forms and the straightening of the complex articulated contour has been played by alluvium throughout all the stages of its evolution as an embayed coast. The influx of sediments from the bottom became possible only after the submarine slope gradients were reduced again by alluvium. The importance of alluvium increased still further in the course of the Recent coastal uplift. The few forms which were largely dependent on abrasion debris for their supply have developed under the conditions of sediment deficit, undergoing reconstruction and washout. Alluvium is apparently the dominant factor in coastal zone dynamics not only of the southern Maritime Territory, but generally of embayed ingression coasts composed of rocks of fairly high resistance to abrasion and in the early stages of their geomorphological development. (See also W74-04425) (Sinha - OEIS)
W74-04432

MORPHOLOGY AND EVOLUTION OF ALAGOON COAST ON SAKHALIN,
A. T. Vladimirov.
In: Dynamics and Morphology of Sea Coasts, TT 68-50355. p 157-185, 1969. 8 fig, 1 tab, 13 ref. Trans. from Trudy Instituta Okeanologii, Akademii Nauk SSSR Vol 148, 1961.

Descriptors: Coasts, *Lagoons, Algae, *Sedimentation, *Littoral drift, Beaches, Geomorphology, *Sea level, *Shores.
Identifiers: *Bay-bars, Post glacial transgression, *USSR(Sakhalin Island).

The most characteristic structural feature of the northeastern seaboard of Sakhalin Island is the extensive development of lagoons. These lagoons stretch in a nearly continuous chain over more than 300 km. On the whole, the lagoons are shallow and in a majority of cases have a thick covering layer of algae. Morphological analysis data have established the existence of three beach drifts within the boundaries of the northeastern coastal region of Sakhalin. Data determined by investigations of the seaboards of several seas show that the straightening of the coastal contour is often the leading process in the last stages of coastal development. Depending upon the initial contour and the structure of the submarine coastal slope, accumulation forms of different genesis could arise in the first stages of development. However, further straightening of the coast and gradual merging of accumulation forms caused the majority to become polygenetic. Extensive straightening of the coastline, and development of a lagoon coast which replaced the earlier, mostly ingressive coasts were the result of a general slowing down of post-Glacial transgression followed by relative stabilization of sea level. The region of Sakhalin Island was cited by Zenkovich (1946) as a typical example of the development of an embayed coast with a gentle submarine slope. The detailed analysis of the data demonstrated the very complex nature of the coastal development under actual specific conditions, and likewise confirmed the proposed schemes. W74-04433

SUBMARINE SAND RIDGES AS INDICATORS OF LONGSHORE MIGRATION OF SEDIMENTS,
V. L. Boldyrev.
In: Dynamics and Morphology of Sea Coasts, TT 68-50355. p 207-217, 1969. 2 fig, 25 ref. Trans. from Trudy Instituta Okeanologii, Akademii Nauk SSSR, Vol 48, 1961.

Descriptors: *Sand waves, *Littoral drift, *Sediment transport, *Waves(Water), Sand bars, Translations.
Identifiers: *Submarine sand ridges, Black Sea, Azov Sea, Baltic Sea.

Field observations on the coasts of the Black, the Azov, and the Baltic seas and analysis of air photographs for different coastal stretches demonstrated that the relative number and arrangement of submarine ridges, as well as the granulometric distribution of sediments in the ridge zone, are directly related to variations in the principal parameters of beach drifts and the total reserves of unconsolidated debris on the bottom. Variations in the morphology and dynamics of submarine ridges are usually closely related to variations in the principal parameters in the beach drift, viz., its transporting capacity and competence. A decrease in the number of ridges or their total disappearance in the path of the beach drift indicates a considerable variation of the hydrodynamic regime. The presence of even a single ridge in the path of the beach drift indicates transit of sediments in the area, providing steady supply for the ridge. The appearance of single or several ridges in the path of obviously undersaturated beach drift in certain coastal areas indicates a drop in competence and partial accumulation of sediments on the bottom. An increase in the number of submarine ridges in the path of the beach drift likewise indicates increased carrying power or

decreased competence. The presence of coarse-grained sediments and coarse debris in the troughs between the ridges, as well as bottom areas which have no sediments, indicates undersaturation of beach drift. The echelon arrangement of ridges indicates that they are being formed by waves and not by currents, although the latter introduce certain modifications in the ridge morphology, e.g., they may facilitate the overdeepening of troughs and hence a more pronounced ridge relief. CERTAIN ASPECTS OF THE INTERACTION BETWEEN WAVE FLOW AND A DEFORMABLE BOTTOM AT LOW VELOCITIES,
B. A. Shuyak.
In: Dynamics and Morphology of Sea Coasts, TT68-50355. p 218-283, 1969. 12 fig, 6 tab, 30 ref. Trans. from Trudy Instituta Okeanologii, Akademii Nauk SSSR, Vol 48, 1961.

Descriptors: *Ripples, Aeolian soils, Wind, Coastal structures, *Waves(Water), Flow, *Sedimentary structures, Hydraulic structures.
Identifiers: Black Sea, Bottom topography.

Results are presented of studies of periodic structures of wave flow, including the conditions and mechanism of the formation of periodic wave structures; dependence of their parameters upon those of wave flow, liquid and particle constants; dependence of the symmetry of structures upon that of flows; and classification of wave, channel, and eolian periodic forms. Also discussed are transverse periodicity of ripples; the barrier effect; dependence of the velocity of ripples and particle flow upon wave parameters; kinematics of the bottom layer of a wave flow passing over a periodically deformed bottom; and, finally, the application of artificial periodic structures of the wave flow to the protection of hydraulic structures against burial by sediments. W74-04435

THE POSSIBILITY OF FORECASTING TRANSIENT COASTAL RELIEF CHANGES BY WAVES,
V. V. Longinov.
In: Dynamics and Morphology of Sea Coasts, TT68-50355. p 284-306, 1969. 1 fig, 13 ref. Trans from Trudy Instituta Okeanologii, AkademiiNauk SSSR, Vol 48, 1961.

Descriptors: *Waves(Water), Coasts, *Profiles, *Slopes, *Tides, *Sediment transport, Translations.
Identifiers: *Wind waves.

Section I deals with the factors controlling the changes of the coastal zone relief and the mechanism of such changes. Section II provides a classification of the profile types found in the coastal zone, based on their hydrodynamic features and their relation to the dynamics of relief and sediments established in Section I. Section III provides certain principles for forecasting coastal zone relief dynamics, or at least the alterations in its profile. The profile dynamics of the submarine coastal slope is considered mainly as a two-dimensional problem. Under natural conditions the movement of the water and sediments in the coastal zone occurs mainly simultaneously along the profile and along the shoreline. Eventually, it will only be possible to understand the changes occurring in this zone and to forecast them correctly by dealing with the relief dynamics in the coastal zone as a three-dimensional problem. A classification of profiles consists of the following: profiles with pebble beaches, 'rugged' for a great majority of waves; sandy profiles with large gradients; sandy profiles with small gradients; the extremely shallow sandy profiles; and finally, the coastal zone relief that faithfully follows the bedrock relief, although the latter may be covered by a sediment blanket. Relief dynamics in the coastal zone are thus organized for further detailed study. (See also W74-04425) (Sinha - OEIS)
W74-04436

THE DETERMINATION OF MAXIMUM WAVE VELOCITIES IN THE SHORE ZONE OF THE SEA,
V. V. Longinov.
In: Dynamics and Morphology of Sea Coasts, TT68-50355. p 307-329, 1969. 3 fig, 6 tab, 13 ref. Trans from Trudy Instituta Okeanologii, Akademii Nauk SSSR, Vol 48, 1961.

Descriptors: Coasts, *Shores, *Waves(Water), *Slopes, Profiles, Measurement, *Pressure, *Shallow water, Translations.
Identifiers: Nearshore processes, *Wave velocity, Wave pressure.

The solution of many practical problems requires the determination of the maximum wave velocities in a certain horizon of the water column in the shore zone seawards of the wave dissipation zone for given parameters of the deepwater waves and a certain submarine coastal slope relief. The method proposed for determining wave velocities in the shore zone is based on data elicited by field measurements of wave velocity pressures with VDK devices, most of which have already been published (Longinov, 1958). A few empirical equations and coefficients are provided for determining more accurately undulatory movements of water in the shore zone based on additional observations and certain new phenomena discovered by recent measurements. An attempt was made to transfer readings of the VDK device to real velocities, but the reliability of this transition was far from established. The first section of this paper deals with the substantiation and more accurate description of this transition. Section II provides a method for calculating the asymmetry of pressures, based on observations. Section III provides the correction factors for transition from the mean values of observed pressures to values with a reliability of 5 and 1%. In Sections IV and V the results of measurements of the frontal and the vertical wave pressure components are given. Section VI offers certain experimental data on normal pressure variations according to the horizon in which the measurement device was installed. (See also W74-04425) (Sinha - OEIS)
W74-04437

THE EFFECT OF WAVE REFRACTION ON THE FORMATION OF AN EQUILIBRIUM PROFILE OF SUBMARINE COASTAL SLOPE,
B. A. Popov.
In: Dynamics and Morphology of Sea Coasts, TT68-50355. p 330-349, 1969. 5 fig, 11 ref. Trans from Trudy Instituta Okeanologii, Akadomii Nauk SSSR, Vol 48, 1961.

Descriptors: *Shores, *Refraction(Water waves), *Waves(Water), Coasts, Profiles, *Slopes, Translations.
Identifiers: Wave action, *Equilibrium profile.

Refraction of waves is among the main factors controlling the formation of an equilibrium profile of the submarine slope. It enhances the natural trend of the process. A profile of any shape cannot reverse its curvature without the interference of additional factors. Under the influence of refraction, a convex slope must inevitably develop as abrasional, while a concave slope must develop as a accumulative. A planar smooth submarine slope may develop different equilibrium profiles, depending upon its gradient, being in the main an accumulation profile in the case of small initial gradients and an abrasion profile in the case of fairly large gradients. An abrasion equilibrium profile may be formed in principle in certain cases where there is a small initial bottom gradient, although at first glance this conclusion contradicts the established ideas. Investigations of wave interaction with slopes undergoing washout in wave tanks exclude the effect of refraction. In this manner the process is distorted and much care is needed to interpret the results. It is preferable that such investigations be performed on spatial shore models in wave basins. W74-04438

THE POSSIBILITY OF PREDICTING LONGSHORE CURRENTS IN TIDELESS SEAS,
I. F. Shadrin.
In: Dynamics and Morphology of Sea Coasts, TT68-50355. p 350-364, 1969. 2 fig, 1 tab, 14 ref. Trans from Trudy Instituta Okeanologii, Akademii Nauk SSSR, Vol 48, 1961.

Descriptors: Coasts, *Shores, *Waves(Water), *Circulation, *Shallow water, Translations.
Identifiers: Nearshore, *Wave energy, *Longshore currents, Shoaling, Breaking waves, Wave theory.

The principal process in water dynamics in the shore zone is the transformation of wave energy which on the whole determines also the character of water circulation in the vicinity of the shore. Calculations of the velocities of longshore currents are therefore based on the transformation of wave energy in the transformation of the shoaling waves from purely oscillatory into translatory motion of the entire agitated water column. Complexity of the process prevented the elaboration of a strict theory which would describe the actual shoaling waves from the beginning of deformation to the moment of breaking with the necessary degree of accuracy Therefore, when considering the factors generating currents in the shore zone, that wave theory is chosen which offers the best agreement with the actual waves observed in the shallow area under investigation. THE ROLE OF EOLIAN PROCESSES IN THE DYNAMICS OF A SHALLOW ACCUMULATION COAST,
N. A. Aibulatov.
In: Dynamics and Morphology of Sea Coasts, TT68-50355. Vol 48 p 365-371, 1969. 3 fig, 8 ref. Trans from Trudy Instituta Okeanologii, Akademii Nauk SSSR, Vol 68, 1961.

Descriptors: Aeolian soils, *Sediment transport, *Dunes, *Wind erosion, *Beaches, Profiles, Coasts, Translations.
Identifiers: *Aeolin sands, Black Sea, *Wind transport.

In investigations of the dynamics of sandy marine deposits it was necessary to study eolian processes, since it was impossible not to take their effects into account in the coastal zone. For instance, the following vivid instance of the burying effect of eolian deposits in one of the ports was observed. Strong continental winds (up to 20 m/sec) formed a sandy beach some 5 m wide at the almost sheer port wall in five days. Investigations were carried out in an area of the Anapa bay-bar in the Black Sea. Even under the specific conditions of Anapa bay-bar, the volumes of wind-transported sand demonstrated the importance of the wind-sand stream in the dynamics of as to the degree of capitalization and the extent to which it can be measured. SLOPE DEVELOPMENT ON A MISSISSIPPI RIVER BLUFF IN HISTORIC TIME,
King's Coll., London (England). Dept. of Geography.
D. Brunsden, and R. H. Kesel.
Journal of Geology, Vol 81, No 5, p 576-598, September 1973. 15 fig, 3 tab, 27 ref.

Descriptors: *Degradation(Slope), *Slopes, *Geomorphology, *Bank erosion, Topography, Terrain analysis, Erosion, *Mississippi River, Alluvium, Alluvial channels, *Louisiana.

Hillslope development was examined along a segment of the Mississippi River bluff at Port Hudson, Louisiana. The entire bluff segment was being undercut by a meander of the Mississippi River in 1722. Since that time, the meander has migrated downstream progressively, abandoning the river bluff. A space-time calibration of the hillslopes along the bluff was made by determining the position of the river along the bluff base from historic maps and aerial photographs. In plan, the bluff was divided into three segments: high, intermediate, and low intensity according to processes acting along the base of the bluff. The high-intensity zone represents a zone of active undercutting by the river, the intermediate zone is characterized by basal scour, and the low-intensity zone by basal aggradation. The present rate of retreat for each segment was calculated to be 75, 1.0, and 0.63 ft/year, respectively. The slope profiles within the three zones represent a sequential change reflecting the change in basal conditions. Hillslopes grade from the high-intensity zone, where profiles have a mean slope angle of 44 deg and a well developed cliff face, to the concave profiles of the low-intensity zone. The latter profiles lack the cliff face and have a mean slope angle of 19.5 deg. Slope profiles in each of the zones reach a steady-state condition. It is estimated that a steady-state condition for slopes subjected to subaerial processes can be achieved in slightly more than 90 years. (Knapp-USGS)

THE EFFECT OF COLLECTING TIME AND GRAIN SIZE ON THE SAMPLING OF STREAM SEDIMENTS FOR GEOCHEMICAL MAPPING IN THE ST. CATHARINES AREA, ONTARIO,
Brock Univ., St. Catharines (Ontario). Dept. of Geological Sciences.
E. Gawron.
Available from Brock University, Dept. of Geological Sciences, St. Catharines, Ontario, Canada. Price $2.00. Research Report Series, No 6, Studies in Landscape Geochemistry, No 3, February 1973. 45 p, 9 fig, 2 tab, 9 ref. Canada Geol. Survey Grant 11-70 NRC Grant A 7715.

Descriptors: *Sampling, *Particle size, *Waste quality, *Sediments, *Water pollution, *Canada, Geochemistry, Mapping.
Identifiers: St. Catharines(Ontario).

Factors that influence the variation of chemical data were studied in the Twelve Mile Creek drainage basin of St. Catharines, Ontario. Time of sampling in an industrial and urbanized area is of more importance than in the rural areas. Samples should be collected at specific intervals of time to obtain representative data. During the course of this study, man's influence on the rural scene is at a minimum in the fall and the time of collection did not matter as much as it did in the industrial and urbanized area. To obtain comparable data in a time study or a site study, the sample material should be as similar as possible. For example, a clay sediment contains a higher concentration of trace elements than a sand sediment from the same site. In a time study, the variation of data due to the change in sediment material could be greater than the variation due to time depending on the location. Site inhomogeneity does not affect the variance of chemical data. (Knapp-USGS)

A NUMERICAL CLASSIFICATION OF SELECTED LANDSLIDES OF THE DEBRIS SLIDE-AVALANCHE-FLOW TYPE,
Macquarie Univ., North Ryde (Australia). School of Earth Sciences.
R. J. Blong.
Engineering Geology, Vol 7, No 2, p 99-114, October 1973. 2 fig, 7 tab, 26 ref.

Descriptors: *Landslides, *Classification, *Computer programs, Geomorphology, Mass wasting, *Debris avalanches, Mudflows.

A sample of 92 landslides from the greywacke hill country of the North Island of New Zealand was classified using a computer program, on the basis of 19 numerical and 43 disordered multistate attributes. The results of the agglomerative polythetic classifications do not help to distinguish these landslide phenomena clearly. Furthermore, the formation of individual groups within the computer classifications is dependent upon a wide variety of landslide characteristics. The groups, once formed, frequently bear no resemblance to landslide categories defined in more traditional classifications. Although landslide location on the hillslope proved a useful criterion in the second computer classification, because some other local landslide characteristics are partly controlled by distance from the base of the hill, this attribute is hardly likely to provide the basis of a universally applicable classification. As no one of these classifications of landslides provides any rational basis for comparison of slope failures from area to area, until a realistic scheme is forthcoming it seems sensible to rely on a simple division of landslides according to the nature of the dominant movement. However, the three basic types of failure--rotation, translation, and flowage--must be supplemented by a transitional fourth type, that dominated both by flow and by translational failure. A STUDY ON MASS TRANSPORT IN BOUNDARY LAYERS IN STANDING WAVES,
Kyota Univ. (Japan). Disasters Prevention Research Inst.
H. Noda.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 1, Chap 15, p 227-247, 1969. 9 fig, 9 ref.

Descriptors: *Waves(Water), *Shallow water, Flow, Boundary layers, *Sediment transport, Harbors, Coasts, Convection.
Identifiers: *Standing waves, *Mass transport, Japan, Shoaling.

Mass transport in the boundary layers developed on smooth and horizontal bottoms by standing waves in shallow water is discussed. In a theoretical approach, the basic equations of laminar boundary layers are applied to solving the oscillatory motion in the boundary layers caused by the standing waves. The mass transport velocities are derived on the basis of solutions of the second approximation which describe the flow velocity near the bottom, and the effects of convective terms involved in the basic equations are investigated. Experimental measurements in standing waves of mass transport velocity in the bottom boundary layer were carried out using dye-streak and solid-particle methods. The experimental data are compared with the theoretical prediction. (Sinha - OEIS)

QUANTITATIVE TRACING OF LITTORAL DRIFT,
Norges Tekniske Hoegskole, Trondlheim. Dept. of Harbour Engineering.
P. Bruun.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 2, Chap 20, p 322-328, 1969. 5 fig.

Descriptors: *Littoral drift, *Bed load, *Sediment transport, Tracers, Fluroescent dyes, *Florida.
Identifiers: *Tidal currents, *Longshore transport, Bottom creep.

Tests were run at Fernadina Beach, Florida, using fluorescent tracers and bed load traps with automatic doors and hydraulic lift to determine the thickness of the bed load transport layer on the bottom ('bottom creep'). Longshore transport as bed load seems to increase with longshore wave energy. The importance of a longshore (tidal) current superimposed on the wave-energy current was noted for the low-energy section. The importance of the longshore current is also evident from the trough transports predominance over bar transport for the energy levels under consideration. This is undoubtedly going to change for higher inputs of wave energy accompanied by frequent wave breaking and stir-up activity on the bar. The results are of preliminary and indicative nature only. (Sinha - OEIS)

VARIABLE DISPERSION AND ITS EFFECTS ON THE MOVEMENTS OF TRACERS ON BEACHES,
Hydraulics Research Station, Wallingford (England).
W. A. Price.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 2, Chap 21, p 329-334, 1969. 4 fig, 1 ref.

Descriptors: *Tracers, *Sediment transport, *Beaches, Model studies, *Tidal effects, Dispersion, *Shallow water, Coasts, Littoral drift.
Identifiers: Arithmetical models, Centroid method.

To arrive at a quantitative assessment of sediment transport using tracers it is usual to analyse the results using 'centroid method'. It is satisfactory to apply such a method when the dispersion from any cause is constant over the area under study. However, when tracers are used in a variable dispersive field, as on a beach, the interpretation

of the results by normal methods can give misleading results. A simple arithmetical model is used to demonstrate that it could be misleading to interpret the movements of tracers injected into a variable dispersive field, on and near a beach, by the normal methods. If, however, the present arithmetical model could be made to work quantitatively (that is values could be ascribed to the dispersion coefficients at all points on the bed) then tracer distributions measured in nature could be corrected for the apparent mass transport effect in the onshore/offshore direction so that lateral distributions of tracer could then be used to establish the quantity of drift at various levels. A FIELD INVESTIGATION OF SAND TRANSPORT IN THE SURF ZONE,
Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
E. B. Thornton.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 1, Part 2, Chap 22, p 335-351, 1969. 8 fig, 5 ref.

Descriptors: *Florida, *Beaches, *Sediment transport, Bed load, *Waves(Water).
Identifiers: Fernandina Beach(FL), *Surf zone, *Water depth, Energy spectra, Kinetic energy, Potential energy.

The distribution of bed-load sand transport normal to the beach has been measured in a series of field experiments conducted in the surf zone at Fernandina Beach, Florida. Simultaneous measurements were made of the waves and water particle motion at various locations in the surf zone. The energy flux of the waves was resolved into its longshore component from the measured directional and energy spectra. The bed-load transport is related to the depth of water and longshore energy flux. Insight into the mechanics of sediment transport is obtained by comparing the wave and water particle motion energy spectra, which give a direct measure of the kinetic and potential energy, at various locations in the surf zone. THE EFFECT OF WAVES ON THE PROFILE OF A NATURAL BEACH,
Naval Postgraduate School, Monterey, Calif.
W. C. Thompson, and J. C. Harlett.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 2, Chap 23, p 352-372, 1969. 8 fig, 8 ref.

Descriptors: *Beaches, *Waves(Water), *Profiles, *Sedimentation.
Identifiers: *Wave steepness, Equilibrium profiles, *Hindcasts.

A 60-day study was conducted on a selected natural beach in which the beach profile was measured daily and the waves incident upon the profile were recorded continuously. Beach and wave parameters derived from the field data were empirically combined to yield: (a) quantitative relationships between the change in the profile and the average deep-water wave steepness and wave power over a lunar day (24.8) hours given the profile at the beginning of the period, (b) equilibrium profiles for different values of wave steepness, (c) an empirical relationship between wave steepness and wave power which agrees well with theory, and (d) rates at which the beach profile approached equilibrium for given initial conditions of non-equilibrium. Using the relationship developed between beach change and wave steepness, hindcasts were made of the day-to-day sand elevation at a selected location near the middle of the profile and were found to agree fairly well with the observed sand level. (Sinha - OEIS)

COLLECTIVE MOVEMENT OF SEDIMENT IN LITTORAL ENVIRONMENT,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
C. J. Sonu.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 1, Part 2, Chap 24, p 373-400, 1969. 16 fig, 35 ref. Nonr 1575(03), NR 388-002.

Descriptors: *Sediment transport, *Littoral, *Sand waves, Beaches, *Beach erosion, Profiles, *Sand bars.
Identifiers: Nearshore processes, Longshore currents.

Collective movements of sediment occur in the form of sand waves in the nearshore zone and affect beach topography to a significant extent. Bar-type sand waves move only in the onshore direction and account for various accretive profiles on the subaerial beach. When the beach is eroded, these sand waves are simply disintegrated on the subaerial beach, instead of migrating back in the form of sand waves. These characteristics of bar-type sand waves help explain dynamic behavior of beach profiles with respect to profile configuration, sediment storage, and beach width. Cusp-type sand waves are considered to be a product of interaction between longshore currents and an erodible bed. Their presence causes variability in beach profiles along the shore between those containing a prominent bar and those without a bar. Migration of these sand waves may well produce pulsational transfer of material along the shore. (Sinha-OEIS)

WAVE PERIOD AND THE SWASH ZONE ENERGY BALANCE,
Puerto Rico Univ., Mayaguez. Dept. of Marine Sciences.
G. S. Giese.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 1, Part 2, Chap 25, p 401-414, 1969. 2 fig, 5 tab, 11 ref.

Descriptors: *Beaches, Infiltration, *Waves(Water), *Sediment transport.
Identifiers: Pebbles, Sorting, *Swash zone, *Breaking waves, *Wave period.

The shape sorting of pebbles in the swash zone was studied in an effort to determine the effect of the amount of foreshore infiltration per wave on the swash zone energy balance. Measurements were made of pebbles collected from the swash limit and from the step of selected sandy beaches. The pebbles were sampled on occasions when, and at locations where, the conditions of breaker height, breaker approach angle and foreshore slope fell within predetermined limits. The wave period and the foreshore infiltration rate varied among the beaches and were measured. The results of these measurements indicate that the mean shape of swash limit pebbles, and presumably, therefore, the swash zone energy balance depends upon the amount of foreshore infiltration per wave. Therefore the dynamics of the swash zone the effect of wave period and the effect of foreshore permeability must be considered together. (Sinha-OEIS)

LITTORAL DRIFT AS FUNCTION OF WAVES AND CURRENT,
Waterloopkundig Laboratorium, Delft (Netherlands).
E. W. Bijker.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 1, Part 2, Chap 26, p 415-435, 1969. 2 fig, 12 tab, 7 ref.

Descriptors: *Littoral drift, *Waves(Water), *Currents(Water), Coasts, *Sediment transport, Bed load.
Identifiers: Longshore transport, *Tidal currents, *Longshore currents, Ivory Coast, Abidjan, Bed shear.

An attempt is made to compute the littoral drift, starting from the longshore current velocity as it is generated by the waves or as it may originate from other causes. For the actual computation of the bed load transport a normal bed load transport formula is used, in which, however, according to the method developed in earlier studies, the bed shear is increased as a result of the wave motion. From the tests described it becomes clear that the transport may be treated indeed as a function of the longshore current, even when this current has a direction opposite to that of the component of the wave propagation parallel to the coast. Finally, a computation procedure for littoral drift is presented in which also the transport of suspended load is taken into account, and an example is given of the computation of the littoral drift along Ivory Coast near Abidjan. The result of this computation corresponds rather well to the data known from the prototype. (Sinha-OEIS)

SIMULATION OF HORIZONTAL TURBULENT DIFFUSION OF PARTICLES UNDER WAVES,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
S. P. Murray.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 1, Part 2, Chap 28, p 446-466, 1969. 11 fig, 4 tab, 19 ref. Nonr 1575(03), NR 388-002.

Descriptors: *Sediment transport, *Turbulence, *Diffusion, Fluid flow, *Fluid mechanics, Photography.
Identifiers: Shoaling, Nearshore processes, Power spectra.

By oscillation of an array of turbulence-generating grids in still water, the turbulent fluid velocity field in shoaling waves near the bottom is simulated in a laboratory channel. Solid particles with fall velocities varying between 1 and 40 mm/sec are introduced into the test volume from above. Multiple-image photography using ultraviolet lighting techniques and a suitably placed mirror allows recording of the grain trajectories as functions of time and three space dimensions simultaneously. The Lagrangian intensities of turbulence and diffusion coefficients are then directly measured from the photographic data. The scale times, scale lengths, and the frequencies of the power spectra modes can then be calculated. Properties of the fluid turbulence are inferred from the quasi-neutral particles. The analysis, which is restricted to the component of diffusion in the horizontal direction normal to the grid motion, shows that the turbulent velocity distributions of both fluid and heavy particles are Gaussian, and that their standard deviations (intensities of turbulence) increase regularly with increasing grid Reynolds numbers (grid speeds). Diffusion coefficients likewise generally increase with increasing grid Reynolds numbers. Diffusivities of the heavy particles relative to the fluid are a function of both particle fall velocity and the structure of the fluid turbulence itself. (Sinha-OEIS)

WATER DENUDATION OF MOLEHILLS IN MOUNTAINOUS AREAS,
E. Jonca.
Acta Theriol. Vol 17, No 21-31, p 407-412, 1972.
Identifiers: Meadows, Moles, *Molehills, Mountainous regions, Pastures, *Poland(Karkonosze mountains), Water denudation , *Zoogenic denudation, Erosion.

During its burrowing activities the mole forms numerous molehills on the surface of fields, pastures and meadows. In undulating tracts of land these molehills undergo degradation as the result of denudation and surface erosion processes. Zoogenic denudation processes are particularly active in mountainous areas owing to the climatic and topographic conditions stimulating them there, namely, rapid thawing of snow, considerable water flow, sharp slope gradient and existence of slippery areas of various kinds facilitating transport of rock material down slopes. In the Karkonosze mountain area, Poland zoogenic denudation caused by the mole activity varied from 1-3 tons of rock material/ha pasture annually.--Copyright 1973, Biological Abstracts, Inc.

SHORE TRANSPORT. FORMATION OF SAND SPITS AND TOMBOLOS,
G. Sauvage de Saint Marc, and G. Vincent.
Available from NTIS as AD-672 501, for $6.00 paper copy, $1.45 microfiche. California University, Berkeley, Hydraulic Engineering Lab. Technical Report No HEL-2-17, May 1968. Translation of Transport Littoral Formation De Fleches Et De Tombolos (1954). 42 p, 26 fig, 7 ref. DACW72-67-C-0015.

Descriptors: *Sediment transport, Model studies, Ocean waves, Ocean currents, Littoral, *Coasts, *Sand spits, *Waves(Water), *Currents(Water), *Shallow water, Geomorphology, Translations.
Identifiers: *Littoral transport, Longshore currents, Breaking swell, Wave action.

This study of the formation of sand spits and tombolos is based upon experimenting on models. Because of the essential role of breaking waves, the discussion centers on the action of waves and currents which they generate on the transport of sand along the coast. When swells impinge obliquely on a beach, the breaking swells dig into the beach and set grains of sand into motion and then the sand can be carried away by a current. Consideration is given to the intensity of shore transport under the influence of currents due to the breaking of swells; the influence of swell amplitude, swell wave length, and steepness; the influence of the nature of the sediment; influence of the breaker angle on the intensity of littoral transport; and formation of sand spits. Although the difference between a spit and a tombolo is not always clear, they seem to be formed in different ways. The formation of tombolos appears to be related to the motion of the swell current of 'lateral expansion' which is due mainly to the progressive decrease in amplitude of the swell in the lee of an obstacle such as an island or artificial structure (breakwaters). SELECTED BIBLIOGRAPHY ON BEACH FEATURES AND RELATED NEARSHORE PROCESSES.
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Available from NTIS as AD-464 497 for $6.00 paper copy, $1.45 microfiche. Coastal Studies Series No 11, November 1965. 59 p. Nonr 1575(03).

Descriptors: *Bibliographies, *Beaches, Geomorphology, Coasts, Oceanography, Hydrology, Meteorology, *Coastal engineering, Estuaries, *Waves(Water), *Currents(Water), *Tides, Winds.
Identifiers: Nearshore processes.

The bibliography contains approximately 75% of the most pertinent literature on the subject of beach features and related nearshore processes. The material is listed by subject and by name of author. The fact that about 80 percent of the references are post-1940 reflects a lack of beach process research prior to world war II. A number of the general papers could be listed under more than one subject heading, so an evaluation of their principal content determined their classification. Specific fields covered are: coastal morphology - beach ridges, dunes, inlets, storm induced changes, beach-face configuration, bottom configuration, measurement techniques, sediment properties, sediment transport, beach and nearshore process, shoaling, breaking waves, tides, littoral currents, wave refraction, storms and hurricanes, aeolian processes, coastal engineering and quantitative analysis. The final section contains references to special bibliographies and additional source materials. An author index is included. 1342 items are identified. (Sinha-OEIS)

SEA WAVES AND BEACH CUSPS,
M. S. Longuet-Higgins, and D. W. Parkin.
Geographical Journal, Vol 128, No 2, p 194-201, June 1962. 3 fig, 1 tab, 11 ref.

Descriptors: *Waves(Water), *Beaches, Stratification, *Percolation, *Bays, *Erosion.
Identifiers: Beach cusps, Wave height, *Swash, Shingle, *United Kingdom(England).

Some observations and experiments are briefly described that were carried out in two places on the south coast of England, at Tide Mill near Seaford, and on Chesil Bank, to relate the formation of the cusps to the characteristics of the waves. A model-scale experiment performed by the Hydraulics Research Station, Wallingford, is also reported. It is concluded that the dimensions of the cusps are related more to the length of the swash than to the wave height or wave period, and for a given beach the mean lateral spacing between the cusps is an increasing function of the swash length. The cusps seem to form most easily when there is a vertical stratification of material, with relatively coarse shingle at the surface and a mixed, impermeable layer a few inches beneath. This can be quite simply explained in terms of the mobility of the material in the swash zone; an underlying impermeable layer reduces the percolation of the swash through the beach and so increases the power of the waves to move the shingle. Further the heaped shingle on the cusp promontories is more permeable than the thinner layer in the bays, and consequently is less subject to erosion. This contributes to the relative permanence of the cusp system. Waves whose height is too great for the dimensions of the cusps tend to sweep over the cusp promontories and destroy them. (Sinha-OEIS)

EOLIAN CROSS-BEDDING IN THE BEACH DUNE ENVIRONMENT, SAPELO ISLAND, GEORGIA,
Georgia Univ., Sapelo Island. Marine Inst.
L. S. Land.
Journal of Sedimentary Petrology, Vol 34, No 2, p 389-394, June 1964. 4 fig, 2 tab, 13 ref.

Descriptors: *Georgia, *Barrier islands, *Dunes, *Sediment transport, *Beaches, *Wind erosion, Aeolian soils, Stratification.
Identifiers: Sapelo Island(GA), *Eolian deposition.

The slipfaces of modern beach dunes on Sapelo Island, Georgia, are deposited by the prevailing, competent, dry winds rather than the high energy storm winds. High angle cross-bedding (cross-bedding which dips at least 30 deg) records the orientation of the prevailing winds. Approximately one-half the dune slipfaces and high angle cross-beds are stable at angles which exceed the angle of repose of dry sand, and cross-bed dips as high as 42 deg are stable in, and may be indicative of, the beach dune environment. Elongate sand grains are preferentially oriented parallel to the dip direction of the eolian cross-beds. (Sinha-OEIS)
W74-04737

HIGH-ANGLE BEACH STRATIFICATION, SAPELO ISLAND, GEORGIA,
Georgia Univ., Sapelo Island. Marine Inst.
J. H. Hoyt.
Journal of Sedimentary Petrology, Vol 32, No 2, p 309-311, June 1962. 3 fig, 2 ref.

Descriptors: *Georgia, *Beaches, Islands, Sand bars, *Stratification, *Barrier islands, *Slopes.
Identifiers: Sapelo Island(GA).

Foreshore sand bars at Sapelo Island typically have a steep landward slope. Deposition on this slope results in landward movement of the bar. The deposits are characterized by high-angle cross-stratification with dips as steep as 30 degrees. The dip of stratification formed on the steep landward face of bars of the foreshore beach reaches angles of 30 degrees. Bars up to 5 feet high are common features on the Sapelo Island Beach. Similarly formed stratification in ancient rocks may be measured with angles in excess of the 30 degree maximum observed at Sapelo Island if the beach surface is used as a horizontal datum. (Sinha-OEIS)
W74-04738

RHOMBOID RIPPLE MARK, INDICATOR OF CURRENT DIRECTION AND ENVIRONMENT,
Georgia Univ., Sapelo Island. Marine Inst.
J. H. Hoyt, and V. J. Henry, Jr.
Journal of Sedimentary Petrology, Vol 33, No 3, p 604-608, September 1963. 4 fig, 10 ref. NSF G-16426.

Descriptors: *Ripple marks, *Beaches, *Sands, *Sediment transport, *Waves(Water), *Littoral, Environments, *Currents(Water).
Identifiers: Wave backwash, Washover, Current flow, Rhomboid ripple marks.

The direction of current flow over the beach surface may be determined from the shape of rhomboid ripple marks. Characteristically these ripples are bowed in the direction of current flow and are pointed up-current. They are formed on the foreshore beach by wave backwash and by washover of low bars. The washover ripples result from thin sheets of water moving shoreward over the bars. At Sapelo Island, Georgia, rhomboid ripples are best developed on slopes of 1/2 to 2 deg. The beach material is predominately fine sand. There is a direct relation between the length-width ratio of rhomboid ripples and the slope of the beach surface. (Sinha-OEIS)

Identifiers: *Japan, Beach cusps, Arcuate sand bars, En echelon san bars, Longshore currents, Longshore bars, Nearshore processes, Bottom topography, Shoreline waves, Giant ripple marks, Shoreline configuration.

The origin and movement are discussed of nearshore and underwater sand bars which are seen on aerial photographs taken on the coast of Japan. The bars are described as arcuate and in many cases are found en echelon or in parallel arrangements. The rhythmic bar pattern is correlated with dynamic or static factors such as shoreline configuration, shore face slope and deposits, bottom topography, transformation of incident waves, longshore currents and littoral drift. Implications for coastal engineering are suggested. (Sinha -OEIS)

LABORATORY APPLICATIONS OF RADIOISOTOPIC TRACERS TO FOLLOW BEACH SEDIMENTS,
Corps of Engineers, Washington, D.C. Beach Erosion Board.
N. E. Taney.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 2, Chap 17, p 279-303, 1963. 23 fig, 10 ref.

Descriptors: *Sediment transport, *Tracers, *Radioisotopes, *Beaches, *Waves(Water), *Currents(Water).
Identifiers: *Nearshore processes, Swash, Onshore-offshore movements.

Laboratory applications of the use of radioisotopic tracers for the study of sediment transport are described. Information is given on the equipment, the test basin and conditions and test operations. Results are given in time references. The results seem to indicate several mechanisms which had not formerly been detected. The first of these is a changing movement in the onshore-offshore direction. While there has been an enrichment of the activity by a seaward movement of sediment and tracer material, there are also periods of low activity or low counting rate. Seaward moving uncontaminated sediments could cover the activity and lower the count rate. However, the uncovering of the isotopic tracer as evidenced by the high rates negates such reasoning and points toward an oscillatory motion, onshore-offshore. Analysis of the elevation data fail to clarify this problem as the phenomenon is not recognized in those data. A second mechanism of somewhat similar nature has been discussed as the pulsating transport of sediments in the alongshore direction. It appears that slugs of activity move in the alongshore direction. These slugs are separated from each other by areas of low activity and and appear to form and move independently from each other. Finally the deep alongshore movement had not been determined before by elevation measurements although it was known to exist from earlier experimental work. It may be that this deep movement, in water depths of approximately 1 foot, is quite significant in that the magnitude of activity appears to be of the order of one-half that of the material moving in the zone of wave swash and one-fourth or less of that moving along the zone of wave plunge. (Sinha - OEIS)

TRACING COASTAL SEDIMENT MOVEMENT BY NATURALLY RADIOACTIVE MINERALS,
California Univ., Berkeley. Coll. of Engineering.
A. M. Kamel, and J. W. Johnson.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 2, Chap 19, p 324-330, 1963. 4 fig, 4 ref.

Descriptors: *California, *Littoral drift, Sands, *Tracers, *Sediment transport, *Refraction(Water waves), *Waves(Water), Radioactivity techniques.
Identifiers: Heavy minerals, Thorium, Th-232, Wave action, Sorting.

Thorium (Th-232, 0.238 mev) was used as a natural tracer to determine the direction of littoral drift along the California coast. Radioactive thorium is added naturally at discrete places along the coast where rivers flowing through thorium rich granite outcrops reach the coast or where the thorium rich granite itself outcrops at the sea coast. The choice of the concentrations of both thorite and heavy minerals in parts per million and per cent, respectively, in sand samples collected at mid-tide from different places along the beach, are believed to be two good parameters for the study of the effect of progressive sorting and consequently the determination of the direction of littoral drift along the coast. (Sinha - OEIS)

SOME CHARACTERISTICS OF THE DUTCH COAST,
Rijkswaterstaat-Deltadienst, The Hague (Netherlands). Coastal Research Dept.
T. Edelman, and D. N. Eggink.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 4, Chap 41, p 756-764, 1963. 5 fig.

Descriptors: *Waves(Water), *Currents(Water), *Tidal effects, Coasts, *Shallow water, *Sediment transport, Erosion, Deposition(Sediments).
Identifiers: Tidal currents, Wave action, Nearshore processes, Tidal range, *Netherlands.

Sediment transport along the Dutch coast is discussed in some detail. Consideration is given to the effect of waves and tidal currents on a non-disturbed coast. It is suggested that transport-capacity of a tidal current will increase with the tidal range. If the tidal range increases along the coast in the direction of propagation of the tidal wave, the coast will be eroded. A decreasing tidal range in that direction will cause an accretion. The transport-capacity of waves changes with the direction in which the waves approach the coast. This means that, if a dominant wave-direction exists, the curvature of the coast must be responsible for erosion or accretion by wave action. (Sinha - OEIS)
W74-04754

SIMILARITY IN SEDIMENT TRANSPORT DUE TO WAVES,
Hydraulics Research Station, Wallingford (England).
S. Yalin, and R. C. H. Russell.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 2, Chap 12, p 151-167. 11 fig, 5 ref.

Descriptors: *Waves(Water, *Sediment transport, Model studies.
Identifiers: Wave height, Orbital motion, Ripple height, Ripple length.

The movement by waves of cohesionless sediment lying on a horizontal bed is discussed. In particular the number of dimensionless parameters that are necessary to define the 2-phase motion at the bed is described, the specification of which would enable similarity to be obtained. In general four dimensionless parameters are necessary; but when the motion of the water at the bed can be adequately defined by an orbit length and a period, the two-phase motion can be described by the numerical value of three dimensionless parameters. This condition is satisfied when the wave-height is low, because then the orbital motion at the bed is sinusoidal and the drift velocity is negligible. Model and prototype experiments were conducted in a wave channel, using low waves, in which the scale for depth of water and for wavelengths was 3/10. The dependent parameters, three of which are sufficient to verify similarity of all aspects of the phenomenon were chosen to be ripple height, ripple length and transport of sediment. The identity of the dimensionless numbers signifying the ripple height, ripple length and transport in model and prototype is proof that similarity had been obtained. (Sinha - OEIS)

DRASTIC BEACH CHANGES IN A LOW-ENERGY ENVIRONMENT CAUSED BY HURRICANE BETSY,
Florida State Univ., Tallahassee. Oceanographic Inst.
D. A. Warnke, V. Goldsmith, P. Grose, and J. J. Holt.
Journal of Geophysical Research, Vol 71, No 6, p 2013-2016, April 15, 1966. 3 fig, 2 tab, 6 ref.

Descriptors: *Hurricanes, *Beaches, *Erosion, *Sedimentation, Wave pile-up, *Florida, Coasts, *Tidal effects, Shoals, Storms.
Identifiers: Low energy environments, Wave action, Panama City(FL), Nearshore processes.

A number of beach surveys were made in the course of terrain-analytical studies in the Big Bend area of Florida. The area of Alligator Spit and the islands to the southwest have been classified as a low-energy environment on the basis of estimates of average breaker height. The rate of erosion was greatest during the passage of hurricanes through the Gulf of Mexico, but it was not necessarily directly related to the passage of hurricanes through the Big Bend area. Beach changes associated with the passage of hurricane Betsy (September 8-10, 1965) through the Gulf of Mexico are described quantitatively. These changes are illustrated in the maps and diagrams. It is possible that, because of the east-west path of the hurricane through the Gulf of Mexico, wind-driven water from the eastern sectors of the hurricane was piled up against the beaches at Alligator Spit, resulting in spectacular high tides - about 75 cm above the expected highs. These high tides allowed even moderate wave action to influence a region of the beach which usually is above wave action. Reconnaissance trips to various localities near Alligator Spit and the Panama City beaches immediately after hurrican Betsy revealed pronounced erosion and retreat of the forward dune aprons, where these are present. The eroded material everywhere seemed to be accumulated in widespread shoals near shore. The over-all landward retreat of the forward dune aprons, and the relatively constant widths of the beaches through time, indicate, among other factors, that most of the beach loss is permanent. (Sinha - OEIS)

DEVELOPMENT AND GEOLOGIC SIGNIFICANCE OF SOFT BEACH SAND,
Georgia Univ., Sapelo Island. Marine Inst.
J. H. Hoyt, and V. J. Henry, Jr.
Sedimentology, Vol 3, p 44-51, 1964. 4 fig, 1 tab, 8 ref.

Descriptors: South Carolina, Georgia, Florida, *Beaches, *Dunes, *Sands, *Bubbles, Environment, *Southeast U.S.
Identifiers: *Soft beach sand, Eolian deposits.

The firmness of sand beaches is variable. Some areas of soft sand are due to a spongelike, bubble development up to 16 inches in thickness in the upper part of the beach. The bubbles are formed by air trapped in sand when the area is flooded by the rising tide. Air remains in the sand as bubbles which tend to enlarge to as much as 1/2 inch in diameter with repeated draining and flooding. A critical factor in the development of the bubbles appears to be the dryness of the sand deposit. Eolian deposits on the upper beach are particularly susceptible to bubble development. When exposed on the beach surface, the bubbles result in depressions superficially similar to raindrop imprints. The development and subsequent compaction of the bubbles may leave a permanent record by disrupting the laminae and resulting in a more homogenous appearing bed. The orientation of elongate sand grains is also markedly affected. Bubbles, bubble depressions, disrupted laminae and grain reorientation in addition to altering the original properties of the sand deposit may be useful in establishing the depositional environment. NUCLEONIC SEDIMENT CONCENTRATION GAUGE - COMPARISON OF TRANSMISSION AND SCATTERING MODES,
Bhabha Atomic Research Centre, Bombay (India), Isotope Div.
K. Krishnamurthy, S. M. Rao, and R. Rajagopalan.
International Journal of Applied Radiation and Isotopes, Vol 24, No 11, p 579-583, October 1973. 3 fig, 1 tab, 7 ref.

Descriptors: *Suspended solids, *Measurement, *Instrumentation, *Sediments.
Identifiers: *Nucleonic gauge, Counting, Scattering mode, Transmission mode, Detection limits.

Recent interest in the development of nucleonic gauges for measuring the concentration of suspended sediments in streams prompted this comparison of the transmission and scattering modes of operation for such instruments. It was found that there is hardly any difference in the performance of the gauge in either mode of operation. This could be predicted by the theory as well. The standard deviation under the experimental conditions corresponds to about 700-750 ppm. Besides the fact that there is little or no difference in both types of gauges, since scattering of low energy gamma radiation of 60 keV does not appreciably alter the photon energy even under multiple scattering (mean free path:5 cm), the dependence on the chemical nature of the sediment will be similar to that with the original energy gamma rays. It was also concluded that the nucleonic sediment concentration gauge with Am-241 may not be good for measurement of concentrations below 3000 ppm. (Mortland-Battelle)

THE CALCULATION OF CRITICAL DISCHARGE VELOCITY OF STREAMS IN UNIFORM FLOW AND THE TRANSPORTED SEDIMENT SIZE,
M. S. Quraishy.
Sind University Research Journal (Science Series) Vol 5, No 2, p 215-220, 1971. 1 fig, 3 ref.

Descriptors: *Sediment transport, *Discharge(Water), *Bed load, *Equations, Settling velocity, Depth, Particle size, Shear stress, Viscosity, Channel morphology.

Critical discharge velocity for initiation of bed load movement is the basis of nondimensional relations by which the various critical discharge data can be correlated and interpreted. However, the form of these expressions makes it difficult to calculate the particle sizes of the corresponding terminal velocities. A method is given to overcome this difficulty. (Knapp-USGS)

THE PROBLEM OF CRITICAL DISCHARGE IN SEDIMENT MOTION,
Planning Commission, Karachi (Pakistan). Water and Power Section.
M. S. Quraishy.
Engineering News, Vol 9, No 2, June 1964. 8 p, 2 fig, 12 ref.

Descriptors: *Sediment transport, *Discharge(Water), *Bed load, *Equations, Settling velocity, Depth, Particle size, Shear stress, Viscosity, Channel morphology.

Nondimensional functional relations correlate the product of critical discharge per unit width and the hydraulic gradient or slope of streams in uniform flow with sediment characteristic size. The solution of critical discharge presumes a knowledge only of the interrelation between the critical shear stress velocity and the mean velocity. The various relations for the critical or threshold condition, by the definition of general motion, are also the relations for correlating data on initiation of bed configurations. (Knapp-USGS)

RESPONSE AND RECOVERY OF A PIEDMONT WATERSHED FROM TROPICAL STORM AGNES, JUNE 1972,
Maryland Geological Survey, Baltimore.
J. E. Costa.
Water Resources Research, Vol 10, No 1, p 106-112, February 1974. 7 fig, 2 tab, 13 ref. USGS Grant 14-08-0001-G-38.

Descriptors: *Floods, *Hurricanes, *Atlantic Coastal Plain, *Maryland, *Erosion, Geomorphology, Channel morphology, Rainfall-runoff relationships, Stage-discharge relations.
Identifiers: Tropical storm Agnes(1972).

Tropical storm Agnes generated flooding with a recurrence interval much greater than 100 years in a Piedmont watershed: 633 cfs per sq mi from 60 sq mi. Deposits on floodplains were scarce. Deposition occurred where tributaries joined the main channel, across meander bends, and below valley constrictions such as roads and bridges. Despite the magnitude of the rainfall and flooding there were no slope failures in the basin. The only modifications to the watershed were observed in the lowlands along the main channels. Channel widening was the most spectacular modification. Within 1 year of the flood, channel cross sections were well along recovery. Meandering reaches of the channel recovered faster than straight reaches. The Agnes flood is nearly the largest ever reported from a Piedmont watershed of this size. Large floods in the Piedmont apparently play a minor role in shaping the landscape, whereas large floods in the Blue Ridge/Valley and Ridge and Appalachian Plateau provinces, and consequent slope failure, are very active landscaping agents. (Knapp-USGS)

PROPAGATION OF A FINITE-AMPLITUDE SURFACE WAVE WITH ALLOWANCE FOR RANDOM IRREGULARITIES OF THE BOTTOM,
Nauchno-Issledovatelskii Radiofizicheskii Institut, Gorkii (USSR).
Y. M. Pelinovskiy.
Atmospheric and Oceanic Physics, Vol 7, No 11, p 804-805, May 1972. 1 fig, 9 ref. Trans. from Russian.

Descriptors: *Shallow water, Bores, *Waves(Water), *Gravity waves, *Winds, Coasts.
Identifiers: *Solitary waves, *Bottom topography, Surface waves.

The behavior of the wave surface was considered in the presence of random irregularities of the bottom. Using the method of characteristics, equations of the 'shallow water' theory are solved. This solution holds up to the point where the discontinuity occurs. To find the coordinate at which the shock wave forms involves solving the indirect variational problem for a function of the depth function. At a random distribution of depths, the problem can be reduced to the known problem of whether a Brownian particle can reach the boundaries of some region. The 'shallow water' theory is asymptotic. At sufficiently small amplitudes the waves are not overturned and the bore disintegrates into a succession of solitary waves. The presence of an entire region of random generation of solutions is an additional source for generation of random oscillations in the coastal zone, attributed at present to nonlinear interaction between gravity waves and wind. (Sinha-OEIS)
W74-04841

SUSPENDED AND BEDLOAD SEDIMENT TRANSPORT IN THE SNAKE AND CLEARWATER RIVERS IN THE VICINITY OF LEWISTON, IDAHO,
Geological Survey, Boise, Idaho.
W. W. Emmett, and H. R. Seitz.
Geological Survey Basic-data Report, 1973. 78 p, 26 fig, 16 tab, 4 ref.

Descriptors: *Baseline studies, *Sediment transport, *Design criteria, *Levees, *Idaho, Hydraulic structures, Engineering structures, Data collections, Hydrologic data, Streamflow, Runoff, Sedimentation, Bed load, Computer programs, Forecasting, Planning.
Identifiers: *Snake River(Ida), Clearwater River(Ida).

Backwater on the Snake River and Clearwater River arms of the pending (1975) impoundment of water in back of Lower Granite Dam will necessitate construction of levees in the Lewiston, Idaho, area. Sediment transport and bedload data are presented for use in computer modeling aimed at defining design height of the levees. Information is summarized from data collected from March 1972 through June 1973. For both rivers, the volumes of runoff in the spring of 1972 were considerably greater than normal, and peak flows were moderately higher than normal. Both volumes of runoff and rates of peak flow were considerably less than normal during the spring of 1973. Thus, data are included for a wide range in values of streamflow. (Woodard-USGS)

DETERMINATION OF THE COMPLEXING CAPACITY OF NATURAL WATER,
North Carolina State University at Raleigh. Department of Chemistry.
K. W. Hanck, and J. W. Dillard.
Available from National Technical Information Service as PB-227 874 $4.00 in paper copy, $1.45 in microfiche. Water Resources Research Institute of University of North Carolina UNC-WRRI Report No 85, December 1973. 73 p, 10 fig, 15 tab, 45 ref, 3 append. OWRR A-052-NC(1). 14-31-0001-3533.

Descriptors: *North Carloina, Volumetric analysis, *Polaragraphic analysis, *Analytical techniques, Metals, EDTA, Ions, Pollutant identification, Cobalt.
Identifiers: Neuse River(N.C.), *Voltammetry(Anodic stripping), Complexing capacity, *Ligands, *Metal ions.

An analytical procedure for chemically measuring the complexing capacity (ability of a water to complex metal ions) of natural water is developed and tested. The procedure can be used in evaluating the role of natural complexing agents in the transport, toxicity, and availability of trace metal ions in natural waters. Three methods were evaluated, two based on micro scale complexometric titration using anodic stripping voltammetry, and a third, the recommended procedure, involving chemical conversion of the ligands (substances capable of forming metal complexes with metal ions) in the sample to the corresponding cobalt (III) complex. Differential pulse polarography was used to monitor the decreases in cobalt (III) concentration after production of the cobalt (III) complexes and hence the complexing capacity of the sample. This procedure has a detection limit of 0.6 micromoles of ligand per liter. (McJunkin-North Carolina)

EVALUATION AND SIMULATION OF CHEMICAL-QUALITY DATA FOR FIVE MONTANA SAMPLING STATIONS.
Geological Survey, Helena, Mont.
L. R. Frost, Jr.
Open-file report, 1974. 50 p, 17 fig, 17 tab, 9 ref.

Descriptors: *Water quality, *Water chemistry, *Simulation analysis, *Montana, Sampling, *Hydrologic data, Regression analysis, Computer programs.
Identifiers: *Yellowstone River basin(Mont).

Chemical water-quality data for five daily sampling stations in Montana were analyzed to determine relationships existing between specific conductance or streamflow and the concentrations of the major inorganic constituents. Regression parameters were obtained from data collected from 1961 to 1970. Comparison of laboratory data with simulated data for monthly constituent loads at one station indicated that the more abundant constituents could generally be simulated within 15% of the values computed from laboratory data. Agreement between discrete sample data and corresponding simulated data indicated that the same general agreement could exist for the remaining four stations. (Knapp-USGS)

VISCOSITY MEASUREMENTS OF WATER IN REGION OF ITS MAXIMUM DENSITY.
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
D. J. Kingham, W. A. Adams, and M. J. McGuire.
Journal of Chemical and Engineering Data, Vol 19, No 1, p 1-3, January 1974. 2 fig, 3 tab, 27 ref.

Descriptors: *Water properties, *Viscosity, *Density, *Thermodynamic behavior, Temperature, Thermal properties, Equations.

The viscosity of water was measured at closely spaced intervals in steps of 0.5C over the temperature range 0-10C with a precision of plus or minus 0.014%. Fitting the data to a combined Arrhenius-Vogel equation revealed no thermal anomalies in the rheological behavior of water at the temperature of its maximum density. The tabulated data span the temperature range that is of considerable environmental importance. They should also serve to quiet controversies over previously reported literature values of water viscosities which had a precision of plus or minus 0.6% at best. (Brown-IPC)

CHEMICAL QUALITY OF STREAMS, ALLEGHENY RIVER BASIN AND PART OF THE LAKE ERIE BASIN, NEW YORK.
Geological Survey, Albany, N.Y.
M. H. Frimpter.
New York State Department of Environmental Conservation, Basin Planning Report ARB-3, 1973. 79 p, 38 fig, 8 tab, 27 ref.

Descriptors: *Water quality, *Chemical analysis, *New York, Streams, *River basins, Precipitation(Atmospheric), Streamflow, flow rates, Low flow, Groundwater movement, Hydrologic cycle, Hydrologic data, Sampling, Water chemistry, Water analysis, Correlation analysis, Geology, Water pollution sources, Thermal pollution, *Lake Erie.
Identifiers: *Allegheny River Basin(N Y).

Data are presented from an investigation of chemical quality of streams in the Allegheny River basin and part of the Lake Erie basin, New York, in 1967. The study area includes about 2,200 square miles in the southwestern corner of New York State and lies almost entirely in the Allegheny Plateau physiographic province. The area can be divided into four regions on the basis of chemical quality of streamflow. Streams in Region I drain a nonglaciated area and contain a soft (range of hardness, 20-57 mg/liter as CaCO3) calcium bicarbonate type water. Water in streams of Region II, a glaciated region, has hardness ranges from 61 to 180 mg/liter, and the water is calcium bicarbonate type. Water in streams of Region III, on the Lake Erie Plain, has hardness ranging from 103 to 221 mg/liter. Water type varies and may be calcium bicarbonate, calcium sulfate, or a mixed calcium bicarbonate and sulfate type. Dissolved-solids content of streams in Regions I, II, and III is generally less than 500 mg/liter at low flow. Streams in Regions I, II, and III are unaffected by oilfield brine. Region IV encompasses the drainage areas of oilfields where the stream water is usually sodium chloride type. Hardness of water in Region IV ranges from 84 to 2,100 mg/liter and dissolved-solids content ranges from 70 to 7,480 mg/liter. (Woodard-USGS)

COMMENTS ON VERONIS' PAPER, 'ON PROPERTIES OF SEAWATER DEFINED BY TEMPERATURE, SALINITY, AND PRESSURE'.
Moscow State Univ. (USSR). Dept. of Oceanology.
O. I. Mamayev.
Journal of Marine Research, Vol 31, No 1, p 90-91, 1973. 3 ref.

Descriptors: Oceanography, *Mathematical models, *Temperature, *Salinity, *Density, *Water properties, Model studies, Equations, Graphical analysis, Pressure, Water pressure, *Sea water.

The orthogonal variable to the potential density curve which Veronis (1972) (See W73-13477) suggested as a useful complement to the information contained in potential density, was originally proposed by Mamayev in 1962. In that paper the existence of the line integral along the temperature - Salinity (T-S) curve in the T-S plane was demonstrated; and the integral was shown to be equal to the definite integral of the main part of vertical stability, E. The original theoretical problem was further developed by Mamayev in 1970. Equations showing the existence of the variable on the T-S plane, orthogonal to the density are presented, which are analogous to the Cauchy-Riemann equations. (Jerome-Vanderbilt)

A THREE-DIMENSIONAL MODEL FOR ESTUARIES AND COASTAL SEAS: VOLUME I, PRINCIPLES OF COMPUTATION.
RAND Corp., Santa Monica, Calif.
J. J. Leendertse, R. C. Alexander, and S. K. Liu.
Available from National Technical Information Service as PB-227 957 $3.75 in paper copy, $1.45 in microfiche. Completion report, R-1417-OWRR, December 1973. 57 p, 24 fig, 14 ref, 2 append. OWRR-C-4261(9040)(1). 14-31-0001-9040.

Descriptors: *Estuaries, *Mathematical models, *Numerical analysis, Tides, Fluid dynamics, Computer models, Coastal engineering, Simulation analysis, Unsteady flow, Model studies, Finite element analysis.
Identifiers: *Three dimensional flow.

Principles of computation are described for a three-dimensional model of estuaries, bays, and coastal seas in which nonisotropic density conditions exist. Numerical integration of the finite difference equations for motion, transport, and continuity are used. In these equations the vertical momentum exchange is quadratically related to horizontal velocities, and the effects of vertical accelerations are neglected. The computational method has been tested on a number of basins with boundaries of increasing complexity. A computation for a large lake with irregular boundaries and depth with a horizontal grid of 1000 points and 8 layers took 30 minutes on an IBM 360-91 for a real-time simulation of 67 hours in 4000 time steps. Results indicate that three-dimensional flows can be computed effectively according to the method described.

ESTUARIES,
W. M. Cameron, and D. W. Pritchard.
In: The Sea, Vol 2, Composition of Sea-water. M.N. Hill, editor Chap. 15, p 306-324, 1963. 2 fig, 23 ref.

Descriptors: *Estuaries, Bays, Inlets(Waterways), Gulfs, Sounds, Circulation, *Stratification, Fjords, *Water circulation.
Identifiers: Flushing, Embayments, Kinematics.

An estuary is a semi-enclosed coastal body of water having a free connection with the open sea and within which the sea-water is measurably diluted with fresh water deriving from land drainage. Traditionally the term 'estuary' has been applied to the lower reaches of a river into which sea-water intrudes and mixes with the fresh water draining seaward from the land. The term has been extended to include bays, inlets, gulfs and sounds into which several rivers empty and in which the mixing of fresh and salt water occurs. A discussion is presented of the circulation patterns which occur in tributary embayments to estuaries, which in regard to the increment of fresh water added within the embayment would not be classified by definition as estuaries, but in which the circulation is definitely related to the esturarine character of the adjacent water body. Many of the concepts developed here for estuaries will apply, with certain appropriate modifications, to non-estuarine coastal embayments and even to segments of the coast and of the open ocean. MULTI-DIMENSIONAL ASPECTS OF EDDY DIFFUSION DETERMINED BY DYE DIFFUSION EXPERIMENTS IN COASTAL WATERS (SUMMARY),
Loyola Univ., Los Angeles, Calif.
J. E. Foxworthy, R. B. Tibby, and G. Barsom.
In: Symposium on Diffusion in Oceans and Freshwater, Palisades, NY., August 31-September 1, 1964, T. Ichiye, editor, p 71-73, 1964.

Descriptors: *California, Coasts, *Dye dispersion, *Diffusion, *Statistical models, Model models.
Identifiers: Nearshore, Eddy diffusion, Wind speed.

Results are presented of a series of experiments on multi-dimensional diffusion conducted in the near shore coastal areas off Southern California. Experiments are described on two- and three-dimensional relative diffusion of a patch of dye released from an instantaneous point source. By utilizing a continuous flow type fluorometer and specially designed underway sampling equipment, it was possible to ascertain the average spacetime distribution of fluorescent dye concentration in a diffusing patch. From these data the rates of diffusion (in terms of the mean square dispersion) were determined in the vertical and horizontal coordinate directions. The decrease in maximum dye concentrations with time was proportional to the amount of dye initially released and inversely proportional to the square root of the overall rate of diffusion, as predicted by several statistical models of two- and three-dimensional relative diffusion. A REVIEW OF OCEANOGRAPHIC VARIABLES AND THEIR ANALYSES AND PREDICTIONS OVER THE CONTINENTAL SHELF,
Fleet Numerical Weather Facility, Monterey, Calif.
T. Laevastu, and G. M. Griswold.
In: Proceedings U.S. Navy Fifth Symposium, Military Oceanography, Panama City, Florida, May 1-3, 1968, Oceanographer of the Navy, Vol 1, p 17-25, 1968. 1 tab, 4 ref.

Descriptors: *Coasts, Runoff, *Forecasting, Sound waves, Shallow water, Tides, Tidal currents, Winds, Temperature, Salinity, Marine biology, Bathymetry, *Continental shelf, Reviews.
Identifiers: *Sea-air interaction, *Sea-land interaction.

The factors and dynamic processes affecting the oceanographic variables in coastal waters are categorized and quantitatively evaluated. Processes in coastal and offshore regions are compared and the magnitudes of changes in environmental properties are listed. A quantitative description is given of the coastal sea-air interactions and sea-land interactions, including runoff problems. General analyses and forecasting models for oceanographic variables in coastal waters are presented, based on the above background knowledge. The sea-bottom interactions and the characteristics of marine biology, in coastal waters are summarized. A brief review of the effects of coastal environment on sound propagation is also given. (Sinha-OEIS)

HURRICANE STORM SURGE CONSIDERED AS A RESONANCE PHENOMENON,
Waterloopkundig Laboratorium, Delft (Netherlands).
G. Abraham.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, the Engineering Foundation, Vol 2, Chap 31, p 585-602, 1961. 13 ref. NSF 4630.

Descriptors: *Hurricanes, *Storm surge, *Seasonance, Model studies, Gravity waves, *Waves(Water), *Surges, Coasts, *Tsunamis, Shallow water.

A model study was performed of the water gravity waves generated by a circular local disturbance of pressure, advancing with constant velocity over the surface of water of constant depth. The results indicate that under critical conditions a resonance type phenomenon occurs for which the associated wave heights have a maximum value. The resonant conditions may be an important factor for the generation of the surge due to hurricanes that approach the coast perpendicularly. The following conclusions may be drawn: (1) A period of time of the order of magnitude of one hour may be considered to be sufficient for the development of three dimensional shallow-water maxima in nature. (2) Assuming that sufficient time is available for their development, three dimensional shallow-water maxima up to three times the static water displacement may be considered to be possible in nature. A shallow-water maximum of three times the static water displacement, combined with total reflection against the coast, could explain storm surges up to six times the static water displacement. The shallow-water maxima, combined with the affects of the coast could even explain storm-surges higher than six times the static water displacement. (Sinha-OEIS)

G. M. Watts.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 88, No WW1, Proceedings Paper 3058, p 83-99, February 1962. 7 fig, 19 ref.

Descriptors: *Coasts, *Littoral drift, *Inlets(Waterways), *Sediment transport, *Coastal structures, Geomorphology.
Identifiers: *Sand bypassing, Shoaling.

A brief examination of the general processes of littoral drift movement at uncontrolled and controlled coastal inlets is presented. The principal factors are noted that should be evaluated when mechanical bypassing of drift past an inlet is considered. The general techniques of bypassing are examined, and the types of plants used in the operation are described. A summary is given of all completed and active bypassing projects in the United States. Some of the more important factors that need to be considered in the planning of a bypassing system are geomorphology, subsurface conditions, water level variations, winds, waves, allowable wave runup and overlapping, shore line and offshore depth changes, littoral drift, the effects of nearby inlets or other structures, prior constructive works and their effects, the zone for collecting the littoral drift and placement of drift downdrift of inlet, availability of materials for construction and maintenance, effective time of operation of bypassing system, and comparative costs. HURRICANE TIDE PREDICTION FOR NEW YORK BAY,
Texas A and M Univ., College Station. Dept. of Oceanography and Meteorology.
B. W. Wilson.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, The Engineering Foundation, Vol 2, Chap 30, p 548-584, 1961. 20 fig, 1 tab, 33 ref. N7 onr 48702, N onr 2119 (02).

Descriptors: New York, Surges, *Storm surge, *Hurricanes, *Bays, Gravity waves, Forcing function, *Waves(Water), *Tides, Pressure, *Winds.
Identifiers: *New York Bay, Edge waves.

The solution is presented of the problem of correlating, on a two-dimensional basis, the meteorological parameters of several off-shore storms with the known surge induced by them in New York Bay and with the application of the results to the prediction of likely effects of a design hurricane of given strength traversing a given path at a given speed. A recursion formula is evolved, using the method of finite differences for time increments of 1/3 hour, which relates tide elevation at the bay-mouth with two values of the elevation at 1/3 and 2/3 hour earlier and with values of wind-stress and pressure-gradient driving-force components at times earlier by the periods taken for free long gravity waves to travel from the stations to the bay-mouth. The formula includes a cumulative forcing function term which allows for the geostrophic influence of the earth's rotation and also for an 'edge-wave' effect northward along the eastern seaboard. Moreover it takes into account the observed tendencies of hurricane storm tides in New York Bay to develop resurgences at periods of 7 hours with decay rates of 50% amplitude decrease per cycle. The coefficients of the 'forcing functions', determined by correlation, tend to represent the storm size and speed and also the dynamic augmentation of the forced wave. Predicted maximum storm tide heights are in fair agreement with crude empirical estimates based on central pressures within the hurricanes. (Sinha-OEIS)

ESTUARINE CURRENTS AND TIDAL STREAMS,
Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
R. Agnew.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, The Engineering Foundation, Vol 2, Chap 28, p 510-535, 1961. 17 fig, 20 ref.

Descriptors: Circulation, *Currents(Water), *Estuaries, *Density currents, *Tidal streams, *Tidal effects, Turbulence, Equations of motion, Density, *Mixing.
Identifiers: Tidal range.

Estuarine processes are analyzed in some detail. In particular, consideration is given to density distribution, mean velocities of circulation, turbulence measurements, equations of motion, velocity distribution in density current, and the effects of the neglected inertia term in the dynamic equation. The case of a tidal estuary, which may be treated as a channel closed at one end and open to the sea at the other end, involves the combination of an incident wave whose amplitude decreases exponentially in the direction of propagation (from open to closed end), and a reflected wave whose amplitude decreases exponentially from the closed end to the sea. A general solution is very difficult, but the direction of net movement in a tidal estuary may be inferred from available data on the variation of tidal elevations and mean velocities along the estuary. SEDIMENT MOVEMENT AT INDIAN PORTS,
Birla Inst. of Tech., Ranchi (India). Dept. of Civil Engineering.
M. Manohar.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, The Engineering Foundation, Vol 1, Chap 21, p 342-374, 1961. 20 fig, 10 ref.

Descriptors: Coasts, *Sediment transport, Ports, Harbors, *Estuaries, *Beaches, Erosion, Deposition(Sediments), *Winds, *Littoral drift, *Monsoons, Seasonal, Asia.
Identifiers: *India, Accretion.

Sediment movement along the east and west coasts of India is described. The information presented should be useful in many countries where investigations of the coastlines are far from adequate. The characteristics of the east and west coast features are different in nature with respect to the wind forces, erosion, accretion, and littoral drift. Special consideration is given to the different wind systems with emphasis on the effects of the monsoons. It is indicated that with each type of coast, engineering works will differ. A study of coastal sediment movement is important since what may be beneficial to a harbor may be harmful for preservation of a coastal strip. Improper use of protective structures may accelerate changes along the shoreline rather than stop them. (Sinha-OEIS)

WAVES OFF BENGHAZI HARBOUR - LIBYA,
Halcrow (William) and Partners, London (England).
K. Y. Singh, and L. Draper.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 1, Chap 2, p 9-18, 1969. 5 fig, 5 ref.

Descriptors: *Waves(Water), *Harbors, Forecasting, *Measuring instruments, Fetch, Coasts, Winds.
Identifiers: *Libya(Benghazi Harbour), *Recording instruments.

Details are given of the wave studies associated with the reconstruction of Benhazi Harbour, from the early forecasts, the installation of a recording instrument, its failures and repairs, to forecasts based on more recent techniques and subsequent analysis and presentation of results of records taken from 1961 to 1965. Although reasonable agreement has been obtained between the waves forecast using the latest techniques and the actual measured records, considerable improvement is needed in both the forecasting and recording techniques. Forecasting would be more accurate if wind speed and its duration over the fetch could be determined with greater accuracy. (Sinha-OEIS)

APPLICATION OF FLUORESCENT COATED SAND IN LITTORAL DRIFT AND INLET STUDIES,
Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
M. Stuiver, and J. A. Purpura.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968. American Society of Civil Engineers, Vol 1, Part 2, Chap 19, p 307-321, 1969. 8 fig, 2 tab.

Descriptors: *Florida, *Littoral drift, *Sediment transport, Coastal structures, *Estuaries, *Inlets(Waterways), Tracers, Beaches, Coastal engineering, Fluorescent dye.
Identifiers: *Sand bypassing, West Palm Beach(FL).

Fluorescent coated sand is used in tracing the sand movement along beaches and around inlets. As a part of an extensive beach erosion study along the shore of West Palm Beach, Florida, four areas were subjected to such a tracer study. Each area

represented a particular beach configuration either with or without erosion protective structures. The results of a study of the sand migration in and around South Lake Worth Inlet are discussed. It can be concluded that most of the bypassed material originated from the bar region and not from the beach. This means that sediment not only is transported along the bar but also in substantial quanities across the bar. Observations made in the inlet channel show that the sediment carried into the inlet is predominantly a suspended load. Of more significance is the observed transport through the inlet from sediment originating from the south side of the inlet for waves approaching from a northeasterly direction. The negligible amount of sediment transported outward to the ocean makes this inlet an extreme of a sand drain causing a considerable loss of sand from the surrounding beaches as evidenced by these tracer studies. FIELD INVESTIGATION PRACTICES OF COASTAL STUDIES IN JAPAN,
Tokyo Univ. (Japan).
M. Hom-ma.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 2, Part 4, Chap 76, p 1213-1221, 1969. 4 fig.

Descriptors: *Bibliographies, *Coasts, *Coastal engineering.
Identifiers: *Japan.

A brief review is presented of publications on field studies carried out in Japanese coasts. Japan has many projects of coastal works in relation to the development of an industrial area, the protection of coastal land from disaster and some other purposes. Before the execution of these projects, the agencies in charge of them make field investigations. The results of investigations are reported in their official publications and sometimes the abstracts of them are reported at the annual meeting of coastal engineering held by the Japan Society of Civil Engineers. As the official publication of the governmental organizations are distributed in strictly limited circles, they are not well known by scientists and engineers outside these organizations. Some of these official reports and some additional reports were selected from the proceedings of annual meetings of coastal engineering, and a classification of the contents and a brief review of them are presented. Oregon State Univ., Corvallis. Dept. of Civil Engineering.
B. Glenne.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 2, Part 4, Chap 86, p 1350-1356, 1969. 2 fig, 4 ref.

Descriptors: *Esturaries, *Sediment transport, Diffusion, Mixing, *Bays, *California.
Identifiers: *San Francisco Bay(CA).

During the last two decades considerable progress has been made in analyzing the diffusion process in estuaries. Unfortunately, certain difficulties (e.g. prediction of diffusion coefficients) still prevent common application of the diffusion method. An old technique, related to the diffusion concept, can however, frequently give useful information regarding constituent mixing and transport velocities in natural estuaries. The linear characteristic of the one-dimensional mass continuity equation for constituents (conservative or first order decay) in estuaries shows that the constituent residence times or transport velocities are independent of the consitituent source strength. This fact permits computation of representative constituent transport velocities using artificial or natural tracers with typical discharge locations. The evaluation procedure required a minimum of data and labor; e.g. no knowledge of diffusion coefficients. In estuaries and bays with predominantly one-dimensional constituent transport the procedure gives practical information regarding the mixing and exchange mechanism. In Northern and Southern San Francisco Bay dissolved silica (Si02) was found to be a good representative tracer naturally discharged by rivers and streams. (Sinha-OEIS)

In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 2, Part 4, Chap 88, p 1377-1396, 1969. 4 fig, 12 ref.

Descriptors: *Estuaries, *Tidal effects, *Shear stress, Density.
Identifiers: Mersey River, England, *Shear velocity, Low slack water, Surface slopes, *Energy slope, Inertia, *Tidal cycle, Kinetic energy.

A study involving the determination of the bed shear stress and thence shear velocity in the Narrows of the River Mersey (a well mixed tidal estuary) is described. The two dimensional equation of motion is examined. In order to determine the energy slope, it is essential to evaluate density, inertia and kinetic energy terms as well as surface slopes. Although the density term is much smaller than the other terms it is important at periods of low slack-water. Measurements of the various terms are described and attention is drawn to the difficulties arising in the case of the surface slopes. Comparison is then made between the values of the shear velocity as predicted from the energy slope and those obtained using velocity traverses throughout the depth and with measurements of velocity at three fixed positions near to the bed. Finally consideration is given to the relationship between the cross-sectional mean velocity, the depth-mean velocity at 3 ft above the bed and the shear velocity obtained from the energy slope. There is good linear correlation of each of these velocities with the shear velocity throughout the tidal cycle except for the period around low slack-water. (Sinha-OEIS)

USE OF A COMPUTATIONAL MODEL FOR TWO-DIMENSIONAL TIDAL FLOW,
RAND Corp., Santa Monica, Calif.
J. J. Leendertse.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 2, Part 4, Chap 90, p 1403-1420, 1969. 8 fig, 3 ref.

Descriptors: *Hydraulic models, *Shallow water, *Tidal effects, *Estuaries, Coasts, *Currents(Water), *Wave propagation, Equations.
Identifiers: Tidal flow, Bottom friction, Differential equations, Numerical integration.

A new approach is given to the solution of two-dimensional tidal flow in shallow water. It has been shown that the propagation of long waves in coastal waters can be studied successfully by use of a numerical integration method. The multioperation method developed is characteristic of implicit methods; namely, there is no upper limit on the time step for stability reasons, as is the case with explicit methods. The multi-operation method allows a direct and rapid solution of all velocities and water levels on each time level. The multioperational method described is particularly suitable for long-wave computation in coastal waters, where water movements are introduced by changes in the water level (or currents) along the sides of the model and where the effect of bottom friction is larger than the effects of lateral eddy viscosity, which is neglected. The contribution of the convective-inertia terms in the equation of motion is assumed to be small compared to that of other terms. These terms are represented with a lower order of accuracy. The detailed description of computational procedures permits an expedient introduction of geographic features such as water depth, boundaries, and characteristics of bottom roughness for the modeling of wave propagation. Identifiers: *Carp feeding, *Chironomidae, *Cladocera, *Copepoda, Cyprinus-carpio, Deltas, Insects, Juveniles, Mosquitoes, Ostracoda, Rivers, Rotifers, *USSR(Terek River delta), *Growth stages, Fish diets.

Juvenile carp change to exogenous feeding at the first larval state of development, while still having remains of the yolk sac. At this stage it consumes small organisms (rotifers and nauplius stages of Copepoda). At the second and third larval stages of development the main food objects are the copepodid stages of Copepoda, Cladocera, and rotifers. At subsequent larval stages Copepoda predominated over other groups of food organisms, which corresponded to their content in plankton. At the first fry stage the carp changes to feeding at the bottom, detritus appears in his food, and the number of benthic organisms increases (larvae of Chironomidae, Ostracoda, and larvae of mosquitoes and other insects).--Copyright 1973, Biological Abstracts, Inc.

B. W. Wilson, J. A. Hendrickson, and R. E. Kilmer.
Available from NTIS as AD-684 953 for $6.00 paper copy, $1.45 microfiche. Prepared for Army Engineer Waterways Experiment Station. Contract Report No 2-136, October 1965. 206 p, 74 fig, 11 tab, 45 ref. DA-22-079-CIVENG-65-10.

Descriptors: *California, Model studies, *Harbors, *Waves(Water), *Bays, *Coasts, Numerical analysis, Refraction(Water waves), *Surges, Cyclones, *Climate, Winds.
Identifiers: Monterey(CA), Sea and swell, Oscillations, Monterey Canyon, Long period waves, Talweg, Standing waves, Surf-beats, Wave propagation.

The feasibility is shown of reproducing in an engineering model the surge phenomenon that at various times occurs in Monterey Harbor, California. Wind and wave climate prevailing in and near Monterey Bay is described. Sea and swell data summarized for the deep-water vicinity-area and for Monterey Bay itself. Monterey Harbor tends to be quite well protected from the longer period swells. Statistical data for the occurrence of long-period waves at three sensor positions are examined and compared with similar-type data for Santa Cruz Harbor and for Half Moon Bay Harbor. The oscillating characteristics of Monterey Bay are examined. A detailed study is made of the manner of propagation of long period waves into Monterey Bay. Attention is given to the question whether the surge phenomenon in Monterey Harbor is the consequence of surf-beats or of genuine long-period waves. (Sinha-OEIS)

SEDIMENTATION IN HAWKE BAY,
Department of Scientific and Industrial Research, Wellington (New Zealand). Oceanographic Inst.
H. M. Pantin.
New Zealand Department of Scientific and Industrial Research Bulletin 171, New Zealand Oceanographic Institute Memoir No 28, 1966. 70 p, 14 fig, 11 tab, 23 ref, 4 plates, 1 map.

Descriptors: *Sedimentation, *Bathymetry, Coasts, *Sediments.
Identifiers: *New Zealand(Hawke Bay), Authigenic minerals, Glauconite, Sedimentary structures, Limonite.

Hawke Bay is a conspicuous re-entrant on the east coast of the North Island, New Zealand, measuring some 50 miles from north-east to south-west and extending about 25 miles inwards from the general line of the coast. The surface sediments in Hawke Bay are divided into five groups; offshore gravel zones, sand belt, mud belt, central zone, and sediments associated with the Lachlan Ridge. The sand belt separates the mud belt from the shoreline and the distribution of these two zones appears to be governed by present-day sedimentation. The central zone and parts of the Lachlan Ridge are at present non-sedimentation areas. Other parts of the Lachlan Ridge are areas of slow sedimentation. Yellowish pumice infillings, which occur in the central zone and on parts of the Lachlan Ridge, apparently owe their color to primary authigenic limonite. Secondary authigenic limonite, formed by the oxidation of glauconite, is found in the same areas as the latter mineral. (Sinha-OEIS)

INSHORE SEA SURFACE TEMPERATURE AND SALINITY CONDITIONS AT AGATE BEACH, YAQUINA BAY AND WHALE COVE, OREGON, IN 1970,
Oregon State Univ., Corvallis. Dept. of Oceanography.
J. J. Gonor, A. B. Thum, and D. W. Elvin.
Available from NTIS as AD-717 068 for $3.00 paper copy, $1.45 microfiche. Data Report No. 45, Reference 70-44, November 1970. 30 p, 5 fig, 5 tab. ONR-N00014-67-A-0369-0001.

Descriptors: *Surf, *Oregon, *Salinity, *Temperature, Topography, Hydrography, Bays, Estuaries.
Identifiers: Agate Beach(OR), Yaquina Bay(OR), Whale Cove(OR).

Daily temperature and salinity conditions measured in the surf at Agate Beach, Oregon, are given and summarized by 15 day periods, with the range, mean and standard deviation of each period indicated. Conditions in 1970 are briefly compared to those observed in 1968 and 1969. Water and near surface air temperatures at a station 3 miles inside Yaquina Bay measured at the daily four tidal extremes are tabulated. A system for continuously recording temperature from a thermistor chain installed in the intertidal is described. The design and construction of thermistor pressure cases, thermistor shielding, and dual range Wheatstone Bridge are described. Data recorded from intertidal thermistor chain installed at Whale Cove, Oregon, at the four daily tidal extremes are given. These data are compared to those from Agate Beach, 10 miles away, and it is concluded that there is poor correlation between the two locations due to hydrographic and topographic differences. (Sinha-OEIS)

NEW DIMENSIONS IN ESTUARY CLASSIFICATION,
Washington Univ., Seattle. Dept. of Oceanography.
D. V. Hansen, and M. Rattray, Jr.
Limnology and Oceanology, Vol 11, No 3, p 319-326, July 1966. 4 fig, 15 ref.

Descriptors: *Estuaries, *Circulation, *Stratification, *Salt balance, *Salinity, Classification, Tides, River flow, Geomorphology, Coasts.
Identifiers: Tidal currents.

Results of recent theoretical studies are used as a basis for a new two-parameter system of estuarine classification. The classes are delineated by the magnitudes of the relative stratification and circulation parameters associated with changes in the salt balance mechanism. The theoretical results depend on a knowledge of the eddy coefficients of viscosity and diffusivity. Tentative relationships between these coefficients and the bulk parameters of tidal current, river flow, and geomorphology, which are obtained from experimental data, may be used to determine the salinity and net current distributions in partially mixed and well-mixed coastal plain estuaries. (Sinha-OEIS)
W74-04735

AN APPROXIMATION OF THE WAVE RUN-UP FREQUENCY DISTRIBUTION,
Corps of Engineers, Washington, D.C. Beach Erosion Board.
T. Saville, Jr.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 4, p 48-59, 1963. 5 fig, 1 tab, 6 ref.

Descriptors: *Waves(Water), *Frequency analysis.
Identifiers: *Wave run-up, Wave steepness, Overtopping.

The distribution of wave steepness for fully developed sea is obtained from Bretschneider's joint distribution of wave height and wave period. This steepness distribution is used with standard wave run-up curves to develop a frequency curve of wave run-up. Use of this run-up distribution curve will permit more accurate estimation of the variability in wave run-up for design cases, and particularly the percent of time in which run-ups will exceed that predicted for the significant wave. The distribution may also be used with normal overtopping procedures to determine more accurate estimates of overtopping quantities. (Sinha-OEIS)
W74-04740

TRANSFORMATION, BREAKING AND RUN-UP OF A LONG WAVE OF FINITE HEIGHT,
Hokkaido Univ., Sapporo (Japan). Dept. of Engineering Science.
T. Kishi.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 5, p 60-76, 1963. 11 fig, 5 ref.

Descriptors: *Waves(Water), *Beaches, Profiles, Slopes, Shallow water.
Identifiers: *Long waves, Wave transformation, *Breaking waves, *Wave run-up, Shoaling.

In studying the transformation, breaking and run-up of a relatively steep wave of a short period, the theory for waves of permanent type has given many fruitful results. However, the theory gradually loses its applicability as a wave becomes flat, since considerable deformation of the wave profile is inevitable in its propagation. A discussion concerning the transformation of a long wave in a channel of variable section is presented based on the non-linear shallow water theory. Further, some brief consideration is given to the effects of bottom friction on wave transformation. Breaking of a long wave is discussed. Breaking on a uniformly sloping beach and on a beach of parabolic profile is considered and the effects of beach profile on breaking are clarified. Experimental results on wave run-up over a 1/30 slope are described. (Sinha - OEIS)
W74-04741

ON NON-SATURATED BREAKERS AND THE WAVE RUN-UP,
National Engineering Science Co., Washington, D.C.
B. Le Mehaute.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 6, p 77-92, 1963. 4 fig, 7 ref.

Descriptors: *Gravity waves, *Beaches, *Waves(Water), Energy, Slopes.
Identifiers: *Breaking waves, *Wave run-up, Path curvature.

Some theoretical results pertaining to the physical behavior of gravity waves on a sloped plane are presented. The notion of 'saturated' breakers and 'non-saturated' breakers which follow the breaking index curve is introduced. Criteria for different kinds of breaking and successive breaking of waves are presented. Some considerations on the wave run-up are deduced. Then a critical analysis of the method of characteristics is presented, with some possible refinements. Path curvature effect is taken into account and the problem of waves climbing on a dry bed is solved. Criteria for determining saturated and non-saturated breakers and the wave run-up by the method of characteristics are proposed. (Sinha - OEIS)
W74-04742

EFFECT OF ENTRANCE ON SEICHE MOTION IN OCEAN PORTS,
Indian Inst. of Tech., Kharagpur. Dept. of Civil Engineering.
N. Roy.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 7, p 93-113, 1963. 3 fig, 2 tab, 11 ref.

Descriptors: *Waves(Water), *Seiches, *Harbors, Coasts, Model studies, *Ports, Resonnance.
Identifiers: Standing waves.

The seiche motion induced in a partially open harbor is uniquely determined by the standing wave pattern formed in the outside ocean. The variable location and size of the coupling makes the problem essentially three-dimensional. Existing potential theory has been extended, for the case of a simple rectangular port, to simulate ocean conditions by approximating the open ocean by another rectangular basin of large size. The theoretical problem then reduces to solving the Neuman problem for the two-dimensional Helmholtz equation for a polygonal contour. The finite dimensional approximation of an infinite domain is, however, unsatisfactory at least from the analytical point of view. This difficulty has been removed by using elliptic-cylindrical co-ordinates for the semi-infinite domain in which the perturbation potential has been expanded in terms of periodic Mathieu functions. These theoretical developments have been verified by a series of numerical calculations and experimental studies. (Sinha - OEIS)

INVESTIGATION OF SEICHE ACTIVITY IN WEST COAST HARBORS,
Texas Univ., Austin. Defense Research Lab.
G. E. Ellis, and J. L. Collins.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 8, p 114-126, 1963. 8 fig, 3 tab, 14 ref.

Descriptors: *Seiches, *Harbors, Instruments, *Waves(Water), *California.
Identifiers: San Diego Bay(CA), Long Beach Harbor(CA), *Power spectra, Solion infrasonic hydrophone, *Bottom pressure.

The seiche activity in several West Coast harbors has been investigated. This investigation has been oriented mainly as an experimental problem in which a new oceanographic instrument, the solion infrasonic hydrophone is used to detect bottom pressure fluctuations over a range of 5 sec to 1800 sec periods. A limited theoretical consideration of this problem is presented in an attempt to correlate the seiche phenomenon to the harbor geometry. The data presented are for San Diego Bay and Long Beach Harbor. These data were recorded on magnetic tape and returned to the laboratory for analysis. This analysis consists of prewhitening the data with bandpass filters and then computing the power spectra by the method of Blackman and Tukey. A short discussion is presented to relate the use of this type of data to the study of two harbor engineering problems, ship mooring and close quarter navigation. (Sinha - OEIS)

THE ANALYSIS OF HARBOR AND ESTUARY SYSTEMS,
California Univ., Berkeley. Coll. of Engineering.
J. A. Harder.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 9, p 127-135, 1963. 5 fig, 9 ref.

Descriptors: *Estuaries, *Harbors, *Mathematical models, *Analog models, Hydraulic models.
Identifiers: Geometry.

Harbor and estuary systems are usually associated with complex geometry, and thus we ordinarily cannot depend on mathematics to give general solutions. Instead of solving the hydraulic equations of flow in the complex geometry, the geometry is reconstructed of the prototype in a reduced scale, by means of models, and by assuming that the equations governing the full-size and reduced-scale systems are the same, to find specific solutions through direct measurements in the latter. FLUME EXPERIMENTS ON SAND TRANSPORT BY WAVES AND CURRENTS,
Scripps Institution of Oceanography, La Jolla, Calif.
D. L. Inman, and A. J. Bowen.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 2, Chap 11, p 137-150, 1963. 9 fig, 3 tab, 9 ref.

Descriptors: *Sediment transport, *Waves(Water), *Currents(Water), *Shallow water, Coasts, *Beaches.
Identifiers: Nearshore processes, Wave height.

Measurements were made of the sand transport (solid discharge) caused by waves and currents traveling over a horizontal sand bed in water 50 cm deep. The waves had heights of 15 cm, and periods of 1.4 and 2.0 sec. The sand transport was measured first in the presence of waves only, then in the presence of waves superimposed on currents. The currents flowed in the direction of wave travel, with steady uniform velocities of 2, 4, and 6 cm/sec. Since sand moves to and fro under the influence of waves, sand traps were placed flush with the surface at either end of the bed. The net sand transport was determined by subtracting the amount of sand trapped at the downwave end. The total amount of sand caught in both traps was greatest with waves of 2.0 sec period, while the net sand transport was greatest with waves of 1.4 sec period. Super position of waves on currents of 2 cm/sec produced a two-fold increase in the sand transport for both wave types. Surprisingly, faster currents of 4 and 6 cm/sec caused the discharge to decrease somewhat. Estimates of the power expended by waves was obtained from the decrement in wave height as the wave traveled over the sand bed. Certain calculations show that about one tenth of the total power expended by the waves was used in transporting sediment. (Sinha - OEIS)

LABORATORY STUDY OF SCALE EFFECTS IN TWO-DIMENSIONAL BEACH PROCESSES,
Kyoto Univ., (Japan). Disaster Prevention Research Inst.
Y. Iwagaki.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 2, Chap 14, p 194-210, 1963. 14 fig, 1 tab, 18 ref.

Descriptors: *Beaches, *Waves(Water), *Particle size, *Sand bars, Profiles, *Shallow water, Coasts.
Identifiers: Scale effects, *Wave steepness, *Wave height, Breaking waves.

Laboratory tests on two-dimensional beach processes indicate that these procedures are influenced by the deep-water wave steepness, scale of waves and sand size. The influence of sand sizes on the beach process is not remarkable when the deep-water wave steepness is smaller than approximately 0.01 and, in addition, the ratio of the

wave height to the sand size is smaller than a certain value for each wave steepness. Equilibrium beach profiles are also influenced not only by the deep-water wave steepness but by the wave height and the sand size. The limitation between the normal beach and the storm beach, which is a criterion for generation of longshore bars, can be expressed by the deep-water wave steepness and the ratio of the wave height and the sand size. The crest inclination angle of breaking waves approaches a certain value for each deep-water wave steepness with the formation of the equilibrium beach profile independently of an initial beach slope. This value of the angle agrees fairly with that of breaking waves on the fixed bed of the critical beach slope based on the limitation between spilling breakers and plunging breakers when the deep-water wave steepness is 0.04. (Sinha - OEIS)

LONGSHORE CURRENTS IN ONE AND MULTI-BAR PROFILES RELATION TO LITTORAL DRIFT,
Florida Univ., Gainesville. Coastal Engineering Lab.
P. Bruun.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 2, Chap 15, p 211-247, 1963. 8 fig, 10 tab, 34 ref.

Descriptors: *Littoral drift, *Waves(Water), *Currents(Water), *Beaches, Slopes, Profiles, *Rip currents, Sand bars.
Identifiers: *Longshore currents, Breaking waves, Bottom friction, Continuity principle, Undertow.

Longshore current theories are discussed. A brief review is presented of wave theories for breaking waves including theoretical, laboratory and field results. The longshore current theory based on the momentum inflow over a uniformly sloping beach and bottom is discussed with special reference to its friction factor. Two new longshore current theories - both based on the continuity principle are described. One of them called the rip current approach assumes that all water thrown in by wave breaking runs out in rip currents and will probably be valid for profiles with well developed bars and waves approaching the shore almost perpendicularly. The other theory considers the fact that water from a wave breaking under an angle with the bar flows in with a certain phase difference in time longshore and this will create a longshore slope of the average water table, therefore also a longshore current. The water may return to sea uniformly as undertow or in rip currents or by a combination of both. This theory is particularly valid for waves breaking under a certain, not too small, angle with the bar. In both cases the momentum in the breaking waves is ignored because field observations show that in a well developed bar profile most of the momentum has disappeared inside the bar after wave breaking. WAVES AND TIDES NEAR THE SHORE,
H. Jeffreys.
Geophysical Journal of the Royal Astronomical Society, Vol 16, No 3, p 253-257, October 1968. 12 ref.

Descriptors: *Gravity waves, *Shores, *Slopes, *Waves(Water), *Tides, Coasts.
Identifiers: *Bottom friction, Tidal waves, Nearshore, Breaking waves.

A simplified method is used to give an asymptotic approximation to the behavior of a gravity wave approaching a sloping shore. It indicates that the first serious departure from the linear behavior is due to the rise in importance of the term in a/k(2)h(3). The dissipation in ordinary cases appears to be mainly due to breaking and not to bottom friction. The principle is applied to the superposition of tidal waves on ordinary sea waves. It appears that breakers can account for the largeness of tidal friction in the ocean, and a modified boundary condition in tidal theory is proposed. (Sinha - OEIS)

NUMERICAL COMPUTATIONS OF STORM SURGES WITH BOTTOM STRESS,
ESSA Inst. for Oceanography, Rockville, Md.
C. P. Jelesnianski.
Monthly Weather Review, Vol 95, No 11, p 740-756, November 1967. 24 fig, 20 ref, 3 append.

Descriptors: Coasts, *Storm surge, Storms, *Waves(Water), Mathematical models, *Forecasting, Weather forecasting, Equations, *New Jersey.
Identifiers: Eddy viscosity, *Bottom slip currents, Wind waves, Tropical storms, Landfalling storms, *Bottom stress, Alantic City(NJ).

The storm surge prediction problem is concerned with the rise of coastal waters brought about by meteorological storms. The rising waters not only inundate coastal areas but also act as a pathway for short surface or wind waves to move and break farther inland. The mechanics and prediction of storm surges are discussed. A linear form of the transport equations of motion is used to compute numerically storm surges generated by model tropical storms traveling across model basins. The storms move in any fixed direction and speed relative to a straight line coast and have a restricted number of physical parameters to fix their strength and size. These parameters are readily available in most weather stations. A dissipating mechanism, introduced by Platzman, using only an eddy viscosity coefficient is modified to include a bottom slip current by means of a bottom slip coefficient. These two coefficients are used to control the amplitude of resurgences on the sea following the passage of tropical storms. Numerical values for the coefficients are empirically determined by comparing computed and observed resurgences off Atlantic City. Nomograms prepared from the computations may help in forecasting future storm surges. (Sinha - OEIS)

APPROXIMATE ESTIMATIONS OF CORRELATION COEFFICIENT BETWEEN WAVE HEIGHT AND PERIOD OF SHALLOW WATER WIND WAVES,
Ministry of Transportation, Yokosuka, (Japan). Port and Harbour Research Inst.
T. Ijima.
In: Proceedings of Eighth Conference on Coastal Engineering Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 1, p 1-16, 1963. 5 fig, 6 ref.

Descriptors: *Shallow water, *Waves(Water), *Winds, Energy, *Fetch.
Identifiers: Wind waves, Correlation coefficient, Water depth, Deep water waves.

The equation is derived for the correlation coefficient as a function of fetch on the assumption that the classical energy equation for the significant wave is applicable to the individual wave in a complex sea. Using the same method the correlation coefficient for shallow water waves is estimated as a function of fetch and non-dimensional depth. Also considered is the development of shallow water wind waves and an energy equation for these waves. (Sinha-OEIS)
W74-04761

MODIFICATION OF WAVE SPECTRA ON THE CONTINENTAL SHELF AND IN THE SURF ZONE,
National Engineering Science Co., Washington, D.C.
C. L. Bretschneider.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 1, Chap 2, p 17-33, 1963. 7 fig, 32 ref.

Descriptors: Waves(Water), *Shallow water, *Continental shelf, Continental slope, Coasts, *Percolation, *Refraction(Water waves), Ocean currents.
Identifiers: *Bottom friction, *Wave spectra, Breaking waves, Wind waves, Wave height, Wave period, Surf zone.

The modification of the wave spectrum over the continental shelf is discussed. Modification factors include bottom friction, percolation, refraction, breaking waves, ocean currents, and regeneration of wind waves in shallow water, among other factors. The case for a steep continental shelf with parallel bottom contours and wave crests parallel to the coast and for which bottom friction is neglected was investigated. For this case it is found that the predominant period shifts toward longer periods. The case for a gentle continental shelf with parallel bottom contours and wave crests parallel to the coast and for which bottom friction is important has also been investigated. It is found that the predominant period shifts toward shorter periods as the water depth decreases. The implication is that the significant periods observed in the shallow water over the continental shelf are shorter than those which would be observed beyond the continental slope. In very shallow water, because shoaling becomes important, a secondary peak appears at higher periods. In very shallow water the most probable maximum breaking wave which first occurs would be governed by the breaking depth criteria, whereas in deeper water wave steepness can also be a governing factor. In very shallow water the period of the most probable maximum breaking wave should be longer than the significant period; and for deeper water the period of the most probable maximum breaking wave can be less than the significant period. PHENOMENA AFFECTING IMPROVEMENT OF THE LOWER COLUMBIA ESTUARY AND ENTRANCE,
Corps of Engineers, Portland, Oreg. Special Projects Investigation Section.
J. B. Lockett.
In: Proceedings of Eighth Conference on Coastal Engineering, Mexico City, November 1962, American Society of Civil Engineers, Part 4, Chap 40, p 695-755, 1963. 28 fig, 2 tab, 7 ref.

Descriptors: *Estuaries, *Tidal effects, *Saline water intrusion, *Beach erosion, *Sediment transport, Erosion, Hydraulic models, Reservoirs, *Columbia River, *Littoral drift.
Identifiers: Littoral currents, Shoaling.

Work undertaken to improve the lower Columbia Estuary and Entrance for navigation is described, and past concepts of phenomena controlling the regimen of this area are discussed. Recent advances in technology have given rise to a new concept of tidal hydraulic phenomena which emphasizes the relation of salinity intrusion and littoral movement to the degree of shoaling experienced in estuarine areas. The findings of prototype measurements undertaken in 1959 along the lower Columbia, and other endeavors to expand the knowledge of controlling phenomena, including, statistical wave studies, analyses of offshore changes, studies of attrition and accretion of adjacent shorelines, and comprehensive investigations of the distribution of Columbia River sediments are reviewed in the light of this new concept. Authorization, construction and verification of the comprehensive lower Columbia Estuary hydraulic model are discussed, as well as tests proposed for identification of controlling phenomena and for development of the most effective and economical plan of improvement. Finally, the extent of present knowledge is summarized and considerations are outlined for the future under conditions of controlled upland discharge resulting from contemplated headwater reservoir operation. (Sinha-OEIS)

COASTAL-WATER VEGETATION OF THE LOWER REACHES OF THE DNESTR (IN RUSSIAN),
N. V. Smirnova-Garaeva.
Izv Akad Nauk Mold SSR Ser Biol Khim Nauk. 2. p 18-24, 1972, Illus.
Identifiers: *Coastal vegetation, *Estuaries, Fishing, Navigation, Phragmites-communis, Rivers, Salvinia-natans, Scirpus-lacustris, Stratiotes-aloides, Swamp, Typha-angustifolia, Typha-latifolia, *USSR(Dnestr River), Utricularia-vulgaris, Vallisneria-spiralis, *Vegetation(Coastal), Water.

In order to characterize the vegetation, the lower Dnestr (USSR) was divided into 3 regions: sandy-clayey-steep banked; clayey-floodplain; estuarine-plain. Species growing in each region are enumerated. Vegetation in the swampy territory of the lower Dnestr was classified in 2 groups of plant indicators: plants of the initial stage of swamp formation (e.g., Phragmites communis Trin., Typha angustifolia L., T. latifolia L., Scirpus lacustris L.0 and plants of progressive swamp formation (e.g., Salvinia natans L. All., Utricularia vulgaris L., Vallisneria spiralis L., Stratiotes aloides L.). It is concluded that progressive swamp formation is the rule in the lower Dnestr. It is economically important to preserve navigation on the Dnestr, fishing of its lakes and preservation of the Kuchurganskii estuary. The use of vegetation indicators facilitates development of measures for combatting swamp formation and overgrowth of the Dnestr and its reservoirs by water vegetation.--Copyright 1973, Biological Abstracts, Inc.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

WATER CLEANING TREATMENT,
Raypak Co. Inc., Westlake Village. Calif (Assignee).
H. L. Grimme, Jr.
U.S. Patent No. 3,776,842 3 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 917, No 1, p 286, December 4, 1973.

Descriptors: *Patents, *Alkaline earth metals, Bacteria, Organic matter, Detergents, *Water treatment, *Membranes, *Demineralization, Separation techniques, Desalination.
Identifiers: *Cellulose acetate membrane, Dissolved minerals.

Clean water is produced by pressure passage of the water through a membrane which rejects or prevents passage of impurities such as dissolved minerals, detergents, organic material, bacteria and other pollutants. The pH of the feed water is reduced to below 7.0 by dividing the feed water stream and contacting a portion of it with a cation exchange media to substitute hydrogen ions for the alkaline earth metals and then recombining the portions of the feed water stream. The feed water is passed under pressure over one side of the cellulose acetate membrane with removal of clean water from the opposite side of it. (Sinha-OEIS)

SOLAR DISTILLATION APPARATUS,
J. Lovrich.
U.S. Patent No. 3,775,257, 3 p, 4 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 916, No 4, p 1481, November 27, 1973.

Descriptors: *Patents, *Solar distillation, *Desalination, Sea water, Fresh water, Equipment, Condensation.

A curved dome formed of sheets of transparent material defines the top closure of a heating chamber. A condensing reflector is placed on the outside of the dome. A continuous gutter is placed along its internal periphery. Radial conveying condenser tubes are connected between a central feed header at the top of the dome and the annular tube along the gutter. A sea water supply tank is positioned at a level above the solar heating chamber. A condenser tank has conveying coils in the fluid receiving condensate from peripheral gutter. The distilland is filtered and fed to an underground reservoir. (Sinha-OEIS)

Available from the National Technical Information Service as PB-228 100 $5.50 in paper copy, $1.45 in microfiche. Arid Lands Resource Information Paper No 3, 1973. 168 p, 252 ref. OWRR W-141(3729)(3), 14-31-0001-3729.

Descriptors: *Deserts, *Droughts, *Bibliographies, Semiarid climates, Arid climates, Arid lands, Weather modification, Agroclimatology, Reforestation, Soil stabilization, Water shortage, Grazing, Burning, Land use, Land management, Conservation, Plant populations, Climatology, Irrigation practices, Carrying capacity.
Identifiers: *Climatic change, *Desertification, Nomadism.

An annotated bibliography is presented of 252 references, computer-produced from the University of Arizona's Arid Lands Information System (ALIS), with accompanying text that reviews briefly both cause and effect of world desertification. Causes fall into two categories: long-term (in the geologic sense) climatic change as supported by meteorological, archaeological, geomorphological, vegetational, palynological, and dendrochronological evidence in the literature; and those activities of man's historic occupance of arid and semiarid regions that have contributed to degeneration of marginal lands: agricultural and irrigation practices, grazing, fire, nomadism, and sand stabilization and reforestation. Beyond these two categories, there is a third: climatic fluctuation -- short-term weather patterns induced by uncertain rainfall and followed by cyclic droughts from which marginal areas may not recover if subjected to continued attempts at intensive use that cannot be sustained by a dry year or a succession of dry years. Insufficient water and attempts to increase water supplies to areas endangered by desertification are problems which must be addressed promptly, but training, education, financing, and cultural adaptations will also be required, probably under international sponsorship. ELECTRIC CLOUD AND WEATHER MODIFICATION WITH INTENSE RELATIVISTIC ELECTRON BEAMS,
Nevada Univ., Reno. Desert Research Inst.
F. Winterberg.
Nature, Vol 247, No 5439, p 271, February 1, 1974. 2 ref.

Descriptors: *Weather modification, *Artificial precipitation, *Electrical studies, *Cloud physics, Lightning, Electrical coronas.
Identifiers: *Electron beams.

A method of electric cloud and weather modifications is proposed, based on the projection of a rapid sequence of intense relativistic electron beams into the atmosphere. The maximum range in the atmosphere of relativistic electrons is given by the radiation length, about 280 m, which is rapidly approached for electron energies in excess of 50 MeV. A beam of electrons would normally disperse rapidly in the radial direction due to multiple scattering. This however, is not the case for an intense beam of relativistic electrons which is confined by its own magnetic field. Beams up to 1,000,000 A and with electron energies of many million electron volts lasting up to 100 ns have been already produced by the combination of a Marx surge generator with a Blumlein transmission line, connected to a field emission diode. The total beam energies so far achieved reach the value of megajoules. If such a beam is projected into the

atmosphere it will not disperse radially but rather will produce a channel of hot air, with a maximum channel length equal to the radiation length in air. If now repeated beams are projected into this channel after a time lapse which is equal to the time for the air to expand in the channel heated by the first beam, then the following beams will in part propagate through air of reduced density due to the thermal expansion caused by the first beam. For 10 pulses the length would be 2.4 km. The method permits the disposal of a large negative electric charge into a chosen volume of the atmosphere or of a cloud. The local release of electric charges can result in greatly increased electric fields within a certain cloud region leading to enhanced cloud droplet coalescence resulting in increased precipitation. (Knapp-USGS)

3C. Use Of Water Of Impaired Quality

APPLICATION OF DYNAMIC PROGRAMMING IN MARKOV CHAINS TO THE EVALUATION OF WATER QUALITY IN IRRIGATION,
Hebrew Univ., Jerusalem (Israel).
D. Yaron, and A. Olian.
American Journal of Agricultural Economics, Vol 55, No 3, p467-471, August 1973. 1 tab, 14 ref.

Descriptors: Water resources development, *Dynamic programming, *Markov processes, *Economics, *Evaluation, *Water quality, *Irrigation, *Saline water, Value, Estimating, Planning, Optimization, Methodology, Mathematical models, Systems analysis, Regional analysis.
Identifiers: *Mediterranean climate, Salt leaching, Yield fundtions.

System dynamics play an important role in situations typical to the Mediterranean climate, where a dry summer is followed by a wet winter with stochastic quantities of rainfall. Presented in an economic analysis of the effect of water quality on crop yield, emphasizing the dynamic aspects of irrigation with saline water over a sequence of years. Distinction is made between three ranges of time and three corresponding models for analysis of the value of water quality in irrigation: 'short run' model (confined to one irrigation season), 'longrun' model, and 'extended long run' model. The long run model, which accounts for the effects of salt accumulation in the soil profile over time (salt accumulation is underground reservoirs would be considered in the extended long run model) is considered and dynamic programming in Markov chains is utilized to derive an optimal irrigation policy. Estimates of the value of water quality in irrigation are derived which rely heavily on assumptions and yield functions. Possible applications in water resource decisions are discussed. The economic significance of the model is on two levels, the micro farm level and the level of regional water resource development. (Bell-Cornell)

EVALUATION OF THE USE OF PRICING AS A TOOL FOR CONSERVING WATER,
George Washington Univ., Washington, D.C. Dept. of Management Sciences.
M. H. Chiogioji, and E. N. Chiogioji.
Washington (D.C.) Technical Institute, Water Resources Research Center. WRRC Report No. 2, 1973. 201 p, 11 fig, 46 tab, 211 ref, append.

Descriptors: *Pricing, *Water conservation, *District of Columbia, Water policy, Water consumption, Water supply, Water costs, Evaluation, Water rates, *Municipal water, Maryland, *Water utilization, *Water demand, Management, Virginia.
Identifiers: Washington, D.C.

Historically the economics of water supply has been oriented toward the provision of low cost water to consumers, with very little thought given to pricing principles and policies which could govern the efficient use and development of municipal water resources. Empirical data gathered in the Washington(D.C.)Metropolitan Area show that price increases do have an impact on water consumption. The use of demand management through price policy is proposed as a tool for rationing existing supplies. There is evidence that demand curves for industrial, agricultural, and some domestic uses are significantly price elastic. A two-part rate structure is also proposed to cover the off-peak winter period and the peak summer period. Other means for conserving water use also are suggested. (Palange-Washington D.C. Tech Inst)

SOIL CRUSTING RELATED TO SPRINKLER INTENSITY,
Auburn Univ., Ala. Dept. of Agricultural Engineering.
C. D. Busch, E. W. Rochester, and C. L. Jernigan.
Transactions of the ASAE, American Society of Agricultural Engineers, Vol 16, No 4, p 808-809, 1973. 5 fig, 2 tab, 10 ref. OWRR A-025-ALA(1).

Descriptors: Soils, *Sprinkling, *Infiltration, Runoff, Erosion, *Sprinkler irrigation, *Regression analysis, *Soil moisture.
Identifiers: *Crusting(Soils).

Regression analyses were run to correlate crust strength and crust moisture data. In both field and laboratory studies, the quadratic regression equation of penetrometer (crust strength) reading on crust moisture provided the best fit. It appears that crust strengths developed under two different sprinkling intensities persist over three wetting and drying cycles. Lower sprinkler application rates consistently produced a weaker crust. Increasing the number of water application cycles did not show a consistent effect on crust strength. Previous sprinkling may reduce the strength of a crust formed by subsequent rainfall.

A SIMULATION MODEL FOR EVALUATING IRRIGATION MANAGEMENT PRACTICES,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
R. V. Morey, and J. R. Gilley.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 5, p 979-983, Sept.-Oct. 1973. 5 fig, 16 ref.

Descriptors: Water resources development, *Irrigation systems, *Evaluation, *Management, *Irrigation practices, *Simulation analysis, Meterorological data, Crops, Transpiration, Humid areas, Operation and maintenance, Mathematical models, Systems analysis, *Minnesota, *Soil moisture.
Identifiers: Soil moisture budget, St. Cloud(Minn.).

Rainfall variability is an important factor in the analysis of the feasibility of irrigation in humid areas. In addition, soil moisture holding characteristics, crop transportation rates, and operating procedures for the proposed irrigation system must be considered in a complete evaluation. Presented is a soil moisture budget model for simulating and evaluating irrigation systems and management practices. A modified procedure for budgeting the soil moisture content, a modified growth measure index for computing system performance, and example comparisons of irrigation management procedures are presented. Results of a calibration-verification technique are included. The model is used to test several irrigation management policies for two soil types and 24 years of weather data for St. Cloud, Minnesota. Results give a good insight into the variability in year-to-year transpiration response under irrigation. They also show the effect of irrigation policies on improvement of the transpiration ratio. Finally, the results should be useful in aiding irrigation operators to make better management decisions concerning irrigation feasibility and scheduling procedures. (Bell-Cornell)

COST-BENEFIT ANALYSIS OF IRRIGATION PROJECTS IN NORTHEASTERN BRAZIL,
Brookings Institution, Washington, D.C.
W. R. Cline.
American Journal of Agricultural Economics, Vol 55, No 4 Part I, p622-627, November 1973. 1 tab, 7 ref.

Descriptors: *Irrigation programs, *Project feasibility, Evaluation, *Linear programming, *Cost-benefit analysis, *Labor, Employment opportunities, Costs, Arid lands, Optimization, Mathematical models, Systems analysis.
Identifiers: *Brazil(Northeast), *Shadow prices, *Crop selection, Crop schemes.

Cost-benefit analysis using empirical estimation of labor's shadow price and linear programming for crop selection is applied to major irrigation projects in Northeastern Brazil. The projects tend to be large government schemes with very high investment costs and correspondingly are capital intensive. Due to their high capital intensity, the projects would contribute very little to labor absorption. Labor costs are evaluated at an empirically estimated shadow price rather than at the legal minimum wage. The shadow price of labor used is the weighted average of estimated marginal value products within farm size and product sector subgroups, with weights proportional to the percentage of labor force in each subgroup. The empirical estimate is based on production functions for Northeastern agricultural sectors previously estimated by the author. Discussed is the selection of crop mix for the irrigation projects, using a linear programming optimization incorporating demand limitations. In conclusion, over half the project area is approved. However, these capital intensive projects should rank below investments with similar rates of return but larger employment effects. These projects do not offer a major solution to rural poverty in the Northeast since they would provide employment for less than 2 percent of the region's rural labor force. (Bell-Cornell)

ALLOCATION OF SCARCE RESOURCES TO AGRICULTURAL RESEARCH: REVIEW OF METHODOLOGY,
North Crolina State Univ., Raleigh. Dept. of Economics.
C. R. Shumay.
American Journal of Agricultural Economics, Vol 55, No 4 Part I, p557-566, November 1973. 4 tab, 21 ref.

Descriptors: *Resource allocation, *Methodology, *Agriculture, *Research, *Management, *Project planning, Model studies, Surveys, Investment, Evaluation, Cost-benefit analysis, Optimization, Systems analysis, Water resources, *Reviews, Publications.
Identifiers: Project selection.

With an increasing stress on research budgets, the need for investigating alternative models for managing research is growing. Already, much work has been invested in technique development. This literature has been surveyed selectively to emphasize the breadth of methodological developments for research project selection and resource allocation. To precede additional research, the current state-of-the-art in resource allocation methodology pertinent to agricultural research management is presented. The focus is on quantitative approaches for improving internal consistency of subjective judgments. The marginal principle is applicable to the selection of an optimal investment in management, and a rudimentary framework for implementing that principle is suggested. Methods of ranking projects using both single and multi-dimensional measures of project benefit are presented. Methods within the latter category include information systems, scoring models, and benefit contribution models. Approaches for optimizing resource allocation are discussed. Among these are: benefit-cost analysis, optimization models specifically for research, simulation, and a network model. A partial comparative evaluation of the selected methods is included with the survey. In the area of methodological development, there is great need for innovative thought and practical experimentation to compare costs and benefits of alternative subjective decision processes. APPLICATION OF REGRESSION ANALYSIS TO ESTIMATION OF THE EFFICIENCY OF WATER USE IN IRRIGATION (OPYT PRIMENENIYA REGRESSIONNOGO ANALIZA K OTSENKE EFFEKTIVNOSTI ISPOL'ZOVANIYA VODY PRI OROSHENII),
A. Z. Zakhidov, and M. Z. Ziyakhodzhayev.
Vodnyee Resursy, No 3, p 167-170, 1973. 2 tab.

Descriptors: *Irrigation efficiency, *Irrigation practices, *Water utilization, *Estimating, *Regression analysis, Correlation analysis, Irrigation, Irrigation water, Irrigation systems, Drainage systems, Drainage water, Fertilizers, Crop production, Cotton, Agriculture, Equations.
Identifiers: *USSR(Uzbek SSR).

The importance of water in the irrigation of lands in an arid region is discussed. Relations of cotton yield to runoff of drainage water and to rates of application of irrigation water and mineral fertilizers were established by regression analysis on the basis of agricultural and reclamation data for the Khorezmskaya Oblast in Uzbekistan for 1956-70. Extensive development of a drainage system on saline and salt-affected lands and adoption of efficient agricultural practices will result in a significant increase in cultivated crop yield without a marked increase in the irrigation rate. Desalinzation of lands already irrigated or scheduled for irrigation in the cotton zone of the USSR is a major regional water management problem in the development and increase in efficiency of irrigated agriculture. (Josefson-USGS)

ROLE OF SOIL CONDITIONS IN THE DEVELOPMENT OF MOTHS, (IN RUSSIAN),
Akademiya Nauk Azerbaidzhanskoi SSR, Baku. Institut Zoologii.
S. V. Aliev, and R. M. Akhmedov.
Ekologiya. Vol 3, No 6, p 81-84. 1972.
Identifiers: Agrotis-Exclamationis, Agrotis-Ypsilon, *Cotton, *Grain, *Moths, *Soil types, *USSR(Azerbaidzhan), Caterpillars.

An investigation of grain (unirrigated and irrigated) and cotton fields in 31 regions of Azerbaidzhan, USSR, revealed that caterpillars of Agrotinae, including Agrotis ypsilon and A. exclamationis, are found most often in nature on unirrigated (lowland and piedmont) chestnut, light-chestnut, and chernozem soils and in irrigated fields on friable chestnut and sandy and sandy-loam sierozem soils. There are almost no caterpillars in salinized, clay, calcareous, and meadow soils.--Copyright 1973, Biological Abstracts, Inc.

WATER WITHDRAWAL BY PLANT ROOTS,
Institute for Land and Water Management Research, Wageningen (Netherlands).
R. A. Feddes, and P. E. Rijtema.
J Hydrol Amst. Vol 17, No 1/2, p 33-59. 1972. Illus.
Identifiers: Brassica-oleracea, Growth stages, *Red cabbage, *Roots, *Water withdrawal(Plants).

Water withdrawal patterns of red cabbage (Brassica oleraces L., cv. 'Rode Herfst') grown on a sticky clay soil are analyzed. An analysis of the transport resistance for liquid flow in the plant as well as an investigation on the geometry factor of the root system for red cabbage is presented. The variation of these factors with depth is described, and root extraction rates at different depths are calculated and compared with data obtained from water balance studies. The plant resistance data are in reasonable agreement with existing literature. Because of a nonhomogeneous and poor root development in the early stages of growth, the geometry data of the initial growing stages differ by a factor of 10 from data found in literature. With root development increasing with depth, geometry data decrease to values also reported for other crops. From calculations it is shown that at increasing drying out of the soil the geometry factor is slightly affected, but the plant resistance increases considerably. The latter resistance, however, decreases when the evaporation flux from the plant increases. This phenomenon is mainly caused by the root distribution in the soil with depth, resulting in a relatively higher water uptake from the top layers, as compared with the deeper layers, when the evaporation flux increases. The results may at least partly explain the apparent non-Darcian behavior of the flux of water through the plants.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF SOIL MOISTURE CONDITIONS ON GROWTH AND DEVELOPMENT OF THE POTATO SOLANUM TUBEROSUM L.,
Technische Universitaet, Hanover (West Germany). Institut fuer Gemuesebau.
H. Krug, and W. Wiese.
Potato Res. Vol 15, No 4, p 354-364. 1972, Illus, (English summary).
Identifiers: Assimilation, Consumption, *Growth stages, *Potato, Productivity, *Soil moisture, Solanum-Tuberosum, Tuber.

The influence of high (80-100% saturation) and low (20-30% saturation) soil moisture during different growth stages on growth and development of the early cultivar 'Barima' was investigated by means of pot experiments under controlled temperature. Constant high soil moisture, as compared with low soil moisture, increased the growth rate of stems, leaf area and tubers. The net assimilation rate was higher and the number of tubers greater but, in contrast to low soil moisture conditions, about 50% of the tubers was resorbed during succeeding periods of growth. Plants flowered earlier and more abundantly and the length of the growing period was shorter. Low soil moisture during the early growth stages only increased productivity of the plants. Highest tuber yields occurred where there had an initial dry period of up to 36 days. Low soil moisture following a period of high soil moisture caused a pronounced reduction in the growth rates of aerial organs followed by shedding of the basal leaves. The growth rate of the tubers was reduced to a lesser extent and resorption of tubers decreased. High soil moisture prior to tuber set increased tuber initiation during the subsequent dry period. Water consumption was doubled at high soil moisture. Soil moisture during the growth of the mother plants influenced the seed value of the tubers. Initial dry periods decreased time to emergence and increased growth in height of the young plants. The influence of changing soil moisture conditions on growth and bulking in the field are discussed.--Copyright 1973, Biological Abstracts, Inc.

A COMPARATIVE STUDY OF THE SIZE AND RECEPTIVITY OF THE STIGMA IN WHEAT, RYE, TRITICALE AND SECALOTRICUM,
Max-Planck-Institut fuer Zuechtungsforschung, Cologne (West Germany).
L. D'souza.
Z Pflanzenzuecht. Vol 68, No 1, p 73-82. 1972, Illus.
Identifiers: Humidity, Moisture, Receptivity, *Rye, *Secalotrium, Seed set, Size, *Stigma, Temperature, *Triticale, *Wheat.

The duration of stigma receptivity was studied under controlled conditions. The receptivity of the stigma has 2 phases. In the first the stigma is very receptive; the decrease in seed set/day is slight. The second phase is marked by a sudden drop in seed set. The duration of both phases is influenced by temperature and moisture, the influence of the former being greater. In wheat at 20C and 60% relative humidity (RH) both phases last 4 days. At 30C and 40% RH the first phase lasts only 2 days, the second 3 days. In rye at 20C and 60% RH the first phase lasts 6 days, the second 5 days; at 30C and 40% RH the 2 phases have a duration of 3 days each. The duration of receptivity in Triticale and Secalotricum is similar to that of rye. There is no significant difference in the size of stigmas of rye, Triticale and Secalotricum. All have significantly lower stigmas than wheat. The importance of these studies for hybrid wheat production is discussed. Wheat is suitable for wind pollination both as pollen donor and receiver but only under favorable conditions. High temperatures and how humidities are detrimental.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF LIGHT INTENSITY ON THE QUALITY AND FEEDING EFFECTIVENESS OF GREEN FODDER, (IN RUSSIAN),
M. A. Babakhanyan, S. T. Akhverdov, O. B. Gasparyan, G. A. Akopyan, and N. A. Khachatryan.
Biol Zh Arm 24(8): 70-77. Illus 1971.
Identifiers: Feeding, *Green fodder, Intensity, *Light intensity, Minerals, Nitrogen, Proteins, Vitamins, *Corn, *Peas.

Corn and peas were studied in an artificial environmental with air temperatures at 18-21C, air moisture 60-80% and light intensity of 1200, 4000, 8500, 16,000 and 32,000 erg/cm sq. sec. Increase in light intensity improved retention of mineral elements and guaranteed high yield of green fodder and retention of protein N, vitamins, etc. Green fodder grown under 8500 ergs/cm sq. sec. intensity increased weight of suckling pigs by 4.5 kg in 70 days as compared to 1.7 kg for fodder grown under 1200 ergs/cm sq sec intensity.--Copyright 1973, Biological Abstracts, Inc.
W74-04821

DROUGHT RESISTANCE OF RADIATION-INDUCED MUTANT VARIETIES AND PARENT FORMS OF COTTON, (IN RUSSIAN),
Akademiya Nauk Uzbekskoi SSR, Tashkent. Inst. of Experimental Plant Biology.
N. N. Nazirov, and N. T. Tashmatov.
Dokl Akad S-Kh Nauk. 12. p 15-17. 1972.
Identifiers: *Cotton, *Drought resistance, *Mutant varieties, Radiation.

A comparison of radiation-induced cotton mutants with their initial forms showed that radiation does not substantially affect their drought resistance, despite large difference in other characteristics (photoperiodism, boll size, color and properties of the fiber, ect.). If the initial form was very sensitive to a water shortage in the soil or relative resistant to it, the mutant obtained from it also proved to be, respectively, non-resistant or comparatively resistant.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF WATER SPRAYING ON THE REIN-FORCEMENT OF PHYSIOLOGICAL PROCESS IN COTTON PLANTS,
A. I. Efanova.
Dokl Akad Nauk Tadzh SSR. 15-(9): p 57-59. 1972.
Identifiers: *Cotton, *Organic compounds, *Photosynthesis, Physiological processes, *Transpiration, *Spray irrigation.

Four groups of plants were sprayed with 500, 1000, 1500 and 2000 l/ha. Spraying at 1500 l/ha was the most effective; it increased photosynthesis, and the intensity of transpiration and the formation of larger quantities of organic compounds.--Copyright 1973, Biological Abstracts, Inc.
W74-04823

WATER CONSUMPTION AND BIOLOGICAL COEFFICIENT OF FURROW AND SPRINKLER IRRIGATED COTTON, (IN BULGARIAN),
Academy of Agricultural Sciences, Khaskovo (Bulgaria). Complex Experimental Station.
K. Karev.
Rasteniev''d Nauk. 9(4): p 83-92. Illus 1972. (English summary).
Identifiers: Biological coefficient, *Cotton, Gossypium-Hirsutum, *Sprinkler irrigation, *Water utilization, *Irrigation(Furrow).

The mean 24-hr water use of the native variety No. 4521 of Gossypium hirsutum species varied from planting to development of the 3rd true leaf between 9 and 16 cu m/ha, increasing after that its maximum in the subperiod of most intensive growth and development (flowering-fruiting) of 35 to 53 cu m/ha and declining to 9-19 cu m/ha at the end of the crop-growing season. The consumptive use of water of irrigated and fertilizer cotton fluctuated with the meteorological character of the season between 4210 and 4740 cu m/ha and of non-irrigated and unfertilizer cotton from 2730 and 3330 cu m/ha. At the given level of fertilization (N120P180K60 kg/ha) and at an antecedent soil moisture maintained from flowering to fruiting to both soil depths of over 75% field capacity, the mean 24-hr and the total water consumption of furrow and sprinkler irrigated cotton do not differ substantially because of similar net depths of irrigation water applied. The mean 24-hr water use varied in dependence on the depth to which the soil was wetted. It was from 2 to 4 cu m/ha higher from flowering to ripening in plots the soil of which was wetted to 40 cm compared to that of 70 cm. Soil wetting to 40 cm from flowering to fruiting contributed to a better water supply. The biological coefficient R of unirrigated cotton, estimated after A. M. Alpatev, averaged 0.23 and of irrigated cotton varied from 0.32 to 0.36. In the variants with soil wetting to 40 cm in the flowering-ripening subperiod it averaged 0.34 and with wetting to 70 cm, 0.35.--Copyright 1973, Biological Abstracts, Inc.
W74-04824

RESULTS OF TRIALS WITH TOBACCO AND COTTON ROTATIONS UNDER IRRIGATION, (IN BULGARIAN),
Y. Mulkovski, and I. Popivanov.
Rasteniev''d Nauki. 9(5): p 87-105. 1972. (English summary).
Identifiers: Barley, *Cotton, *Irrigation, Maize, Peanuts, Peas, Poppy, *Tobacco, *Crop rotation.

Cotton and tobacco can be grown alternately and in sequence with other crops (lucerne, barley, peanuts, poppy). Tobacco-cotton rotations were most effective when tobacco was followed by soil-protecting crops such as winter forage pea, winter vetch, garden peas). Post-stubble and soil-protecting winter crops have a positive effect on tobacco. The quality of tobacco grown after regular predecessors is always high, after catch crops it approximates that of tobacco grown in monoculture. Tobacco growing in monoculture gives a lower total produce than tobacco grown in some of the experimented rotations with and without catch crops in which it is in sequence with regular predecessor crops. Tobacco growing is most effective in a rotation with cotton as well as in rotations with peanuts, barley, poppy, winter peas and winter vetch, with steady participation of soil-protecting crops following tobacco and silage maize as catch crops following regular predecessors. The total produce in such rotations is from 11 to 67% higher than of tobacco grown in monoculture. Cultivation of tobacco in rotations with other crops is also an important measure against black shank which causes serious damages in the Sandanski Petrich region, USSR.--Copyright 1973, Biological Abstracts, Inc.
W74-04825

EFFECTS OF FLOODING AND DRAINING AND THEIR ALTERNATION ON THE GROWTH AND UPTAKE OF NUTRIENTS BY RICE (ORYZA SATIVA L., INDICA VAR. IR-8),
University of the Panjab, Lahore (Pakistan). Dept. of Botany.
Khalid Hamid Sheikh.
J Exp Bot. 24(78): p 64-75. Illus. 1973.
Identifiers: Chlorosis, Cultivars, *Drainage, *Flooding, Growth rates, Iron, Manganese, Nutrients, Oryza-Sativa-Indica, Phosphorus, *Rice.

Continuous flooding of the soil (flooded treatment) gave best growth of the cultivar IR-8, whereas soil drained for 4 wk and then flooded for 8 (drained and flooded treatment) resulted in poorest growth and chlorotic plants. Plants grown in the continuously drained soil (drained treatment) and those in the soil flooded for 4 wk and then drained for 8 (flooded and drained treatment) showed intermediate growth. There were no differences in the relative water content of plants growing in the various treatments. Analyses of plant tissues showed that a consideration of the relative concentration of Fe, Mn, and P in the shoots is most closely related to the performance of rice under various cultural conditions. An increase in the concentration of Fe in the plant tissues following flooding was correlated with the best growth (flooded treatment) unless it was accompanied by high level of Mn (as in the drained and flooded treatment) which may have proved toxic, e.g., by interference with Fe metabolism as was evidenced by chlorosis. Measurements of oxidation-reduction potentials, O2 diffusion rates, and the concentration of exchangeable and soluble Fe and Mn in the soils showed that the drained and flooded treatment caused the most extreme reducing conditions. Flooding accompanied by the development of extreme reducing conditions led to a greater accumulation of Mn in the shoots (drained and flooded treatment) whereas flooding accompanied by the maintenance of oxidizing conditions (flooded treatment) resulted in a lower uptake of Mn. Growth of rice plants for 4 wk in the drained soil did not fit them for the reduced conditions which developed during subsequent flooding (drained and flooded treatment).--Copyright 1973, Biological Abstracts, Inc.

A STUDY ON THE DEPTH OF BASIC TILLAGE AND SOIL FERTILIZATION FOR MAIZE GROWN UNDER IRRIGATION, (IN BULGARIAN),
Academy of Agricultural Sciences, Chirpan (Bulgaria). Inst. of Cotton.
N. Kralev.
Rasteniev''d Nauki. 9(5): p 107-118. Illus. 1972. (English summary).
Identifiers: *Fertilization, *Irrigation, Plowing, Soils, Tillage, *Corn(Field).

The depth of plowing for maize grown in the rotation maize-wheat-maize on leached chernozem-smolnitsa soil was studied. Basic tillage for maize (1st field) was experimented at the depths of 18-20, 28-30, 38-40 cm with soil loosening in addition to 8-10 cm at 3 fertilizer levels, no fertilizing, mineral fertilizing at the level in kg/ha of N160P160 and organic fertilizing at the rate of 20 tons/ha. The depth of plowing for wheat was 10 to 15 cm and for maize in the 3rd year 18 to 20 cm. The results of the 5-yr study showed that with no fertilizers the maize yield increases significantly as a result of tillage to a greater depth. Application of mineral and organic fertilizers, in combination with ploughing to 28-30 and 38-40 cm and with irrigation, raises the grain yield by 510 and 520 kg/ha respectively. Plowing to 25 cm combined with 8 to 10 cm subsoiling has no greater effect upon the yield than plowing to 18-20 cm. The aftereffect of ploughing upon the following wheat crop is slightly mainifested at greater plowing depth. In the 3rd yr after subsoiling an influence was observed in the experimental variants with mineral and organic fertilizing in the instances of ploughing to a greater depth. The effect of fertilizing increased substantially when the basic tillage was done at the depths of 28-30 and 38-40 cm.--Copyright 1973, Biological Abstracts, Inc.

RAINFED RICE IN SOUTHERN SENEGAL: EVALUATION OF THREE YEARS' EXPERIMENTATION (1966-1969), (IN FRENCH),
Centre National de Recherches Agronomiques de Bambey (Senegal).
G. Haddad, and L. Seguy.
Agron Trop Ser Riz Rizic Cult Vivrieres Trop. 27(4): p 419-461. Illus. 1972. (English summary).
Identifiers: Experimentation, Fertilizers, Helminthosporium-Oryzae, Pyricularia-Oryzae, *Rainfed crops, *Rice, Sowing, Tillage, *Africa(Senegal), *Fungus diseases(Crops).

The major causes of poor yields in this area are: too-late sowing dates, insufficiently productive varieties, bad physical properties of the soil, bad tillage methods (most often superficial), the record rainfall in this region and frequent fungus attacks (Piricularia oryzae, Helminthosporium oryzae). By earlier sowing on soils well tilled and fertilized and by the use of varieties (indica dwarf type) resistant to diseases, it is possoble to obtain yields of more than 40 q/ha, with only the risks inherent in all rainfed crops.--Copyright 1973, Biological Abstracts, Inc.

COMPARATIVE TESTING OF SHORT-TERM WHEAT MONOCULTURE, (IN BULGARIAN),
Academy of Agriculture Sciences, Karnobat (Bulgaria). Complex Research Inst. of Agriculture.
A. Vassilev.
Rasteniev'd Nauki. 9(4): p 49-58. 1972. (English summary).
Identifiers: Comparative testing, Decomposition, Nitrogen, Nutrition, Organic matter, Root rot, *Wheat monoculture, *Crop rotation, *Corn(Field).

A rotation including one year of maize and 3 yr of wheat was studied in comparison with the ordinary wheat-maize sequence. The former rotation was studied in 2 variants concerning the basic tillage to maize, namely, ordinary plowing to the depth of 25-30 cm and deep plowing to 45-50 cm. Each field (crop) received yearly fertilizers equivalent to 130 kg/ha N and 100 kg/ha P. As a variable of the test one half of each of the 2 wheat fields in the 1st rotation, i.e., the 2nd and 3rd yr of wheat received in addition one half rate of N. Prolonged wheat growing in monoculture under the conditions prevailing in the region and at present applied farming technique results in decreasing yield. This decline in yield is due mainly to poorer N nutrition because of disturbed organic matter decomposition in soil and to heavy inflicted by root rot. The 1st agent affects the wheat crop every year and the second only in years with cool and wet springs. A single plowing to a depth of 45 cm contributes to storing and preserving larger amounts of soil moisture and facilitates organic matter decomposition in the soil. Additional N fertilizing increases the wheat yields reaching in some years those of the ordinary wheat-maize sequence.--Copyright 1973, Biological Abstracts, Inc.

PRODUCTIVITY AND GRAIN QUALITIES OF CERTAIN NEWLY DEVELOPED NATIVE AND FOREIGN WHEAT VARIETIES GROWN UNDER IRRIGATION, (IN BULGARIAN),
Academy of Agricultural Sciences, Tolbukhin (Bulgaria). Inst. of Wheat and Sunflowers.
I. Doncheva, and V. Gotsova.
Rasteniev'd Nauki. 9(4): p 59-68. Illus. 1972. (English summary).
Identifiers: Grain, *Irrigation, *Wheat varieties, *Crop production.

'Bezostaya 1' and 'Erythrospermum 19-16,' 'Kaliakra,' 'Dobrudja,' 'Russalka,' 'No. 54/61-2,' 'No. 142/61-1,' 'No. 55/61-39,' and 'No. 102-4' and the newest high-productive Soviet varieties 'Kavkaz,' 'Avrora' and 'Skorospelka 35' were tested. 'Russalka' variety, under irrigation proved most productive, yielding on a 2-year average 7200 kg/ha against 6090 kg/ha for 'Bezostaya 1.' It has a low, thick and lodging-resistant stem, great earliness, good frost resistance, high grain indices and medium baking qualities. As a variety of intensive type, responding positively to abundant fertilizing and irrigation, it is suited for growing under irrigation. The rest of native varieties and selected lines also possess enhanced productivity and a number of valuable economic properties but they are not satisfactorily lodging-resistant. They may be used as initial parental forms in hybridization while some of them may be grown on farms after a more extensive ecological testing. The new Soviet varieties 'Kavkaz,' 'Avrora' and 'Skorospelka 35' are highly productive, have a high-quality grain and are resistant to diseases but because of insufficient lodging-resistance and late ripeness are not very suitable for growing as irrigated crops.--Copyright 1973, Biological Abstracts, Inc.

NEW CONTRIBUTIONS TO BIOLOGICAL STUDY OF GENETIC TRANSMISSION OF RESISTANCE TO DRYNESS IN DOUBLE HYBRIDS OF ZEA MAYS,
Paris Univ. (France).
D. Buican.
Rev Biol (Lisb). 8(1-4): p 33-56. 1972.
Identifiers: Biological studies, Cell, Double, Dryness, *Genetic transmission, *Hybrids(Corn), Sap, Transpiration, *Corn(Field), *Crops resistance(Dryness), Crops yield.

Two series of double hybrids of Z. mays ('Iowa 4316,' U.S.A. and 'Warwick 303,' Canada) and the parent lines which consisted of 2 simple hybrids and 4 self-fertilized consanguineous lines were tested as to their drought resistance using a variety of methods. Plants were exposed to dryness in the field and in greenhouse pots. Resistance was evaluated according to the relative yields of the exposed and control plants. Also determined were the transpiration coefficient, the accumulation of dry matter and transpiration during the period following exposure, the cell sap concentration, the bound water and resistance to plasmolysis. The physiological indices by themselves did not indicate drought resistance in any of the cases; the degree of resistance could be expressed only by the percentage of values obtained for these indices under dry conditions with respect to those recorded for the same plants under normal conditions. Although heterosis exerts a considerable influence on the productivity and growth of plants, its effect on physiological characteristics such as resistance to dryness is often not discernable. Thus drought resistance cannot be expected to increase from hybridization.--Copyright 1973, Biological Abstracts, Inc.

DROUGHT AND SUPPLEMENTARY FEEDING OF SHEEP IN THE KAROO,
J. G. Cloete.
J S Afr Vet Assoc. 43(3): p 243-250. 1972.
Identifiers: *Africa(Karoo), *Drought, Fodder crops, Lucerne, Maize, Molasses, Nutritional supplements, Phosphorus, *Sheep(Feeding), *Veld management, Water supply.

In a review of methods to carry sheep over seasonal droughts in the Karoo (South Africa) proper veld management, utilization of drought resistant fodder crops and the importance of an adequate water supply are stressed. Carbohydrate lack is the major nutritional deficiency, while phosphorus supplementation seems to be advantageous. During seasonal droughts veld supplementation by a lick containing energy-producing food, phosphate, salt and molasses was not only cheaper than supplementary feeding with, e.g., maize and lucerne, but eliminated pregnancy toxemia and heightened estrous activity. During protracted (periodic) droughts handfeeding must be used, which must be begun when the body mass in the case of dry sheep is reduced to about 85 lb (38.6 kg). The best results were obtained with a ration of maize and lucerne hay in equal parts.--Copyright 1973, Biological Abstracts, Inc.

Technical Report No CRWR-100, HYD-14-7301, October 1973. 136 p, 27 fig, 26 tab, 59 ref. OWRR B-096-TEX(2). 14-31-0001-3651.

Descriptors: *Management, Water resources development, Urbanization, Systems analysis, *Optimization, Stochastic processes, *Dynamic Programming, *Texas, *Reservoir operation, Multiple-purpose reservoirs, Waste demands, Water supply.
Identifiers: *San Antonio(Tex).

A method is developed for solving the problem of optimal operation of multi-reservoir water resources systems. In the method employed, account is taken not only of the stochastic aspects of the inflows but also those of demands and the possible correlation between inflow and demand sequences, as well as the uncertainties of future demographic and economic factors. The multi-reservoir system is decomposed into interlinked subsystems for which operating policies are developed by separate dynamic programming formulations. An iterative procedure is used to adjust the operating policies of the subsystems until the necessary correspondence between the subsystem policies is reached. Synthetically generated sequences of inter-related inflows and demands are used to gain insight into the variation of system performance caused by the uncertainties in inflows and demands, while the concept of alternative futures is utilized to gauge the effect of changes in demographic and economic factors. The efficacy of the method is demonstrated by applying it to derive the optimal operation of the San Antonio water resources system. (See also W74-04315)

Identifiers: Network models, Pumping stations, *Philadelphia(Pa.), Load control center.

This study is concerned with the investigation and development of computer methodologies and software which lead to the eventual 'closed loop control' or computer assisted-supervisory control of water distribution systems. The two approaches to mathematical modeling currently being investigated are the traditional network model and a regression model; both are discussed and compared in detail in the context of water distribution system control. The network model comprises the usual flow-head representations of the system's individual elements--pipes, pumps, and tanks; these elements are defined in the standard manner for a Hardy Cross network balance. The water distribution regression model is a set of quasi-empirical mathematical expressions relating important variables, particularly those associated with control, such as pumping station head or tank level. One of Philadelphia's water distribution districts was used as a test bed for the research. The district--the Torresdale High Service - Fox Chase Booster District--comprises 27 square miles with elevations ranging from 100 to 265 feet and is fed by two pumping stations separated by a distance of five miles, which ride on two different tank fields six miles away. The pumping stations are regulated by a load control center which has data logging and supervisory control capabilities. (Bell-Cornell)

Descriptors: *Wetlands, Economics, Institutions, *Institutional constraints, Northeast U.S., *Massachusetts, *Land use, Legislation, Taxes, *Regional economics, Cities, Planning, Preservation, Leases, Bond issues, Market value, Land management.
Identifiers: *Ownership costs.

The relationship between wetlands and man, as conditioned primarily by the institutional considerations, is discussed. Emphasis is on the description of forces affecting wetland usage and the social value of such lands. Forces studied include the laws governing wetland usage; nature of ownership; ownership costs such as taxes; and goals and plans of the owners of wetlands. Also considered are the activities of groups such as real estate dealers, and construction firms, and the influence of public opinion. The study is based on the survey of wetlands in fourteen Massachusetts towns and cities. Specific recommendations are made for more comprehensive land use legislation; election and composition of municipal conservation commissions; regional rather than local approach to conservation; wetland protection by delineation of boundaries and planned preservation measures; acquisition of wetlands through installment bonds purchase or public lease programs; and taxation exemption for wetlands based on 100% market value of lands. WATER PROBLEMS OF THE TISZA RIVER IN HUNGARY AND COOPERATION AMONG TISZA BASIN COUNTRIES IN THE FIELD OF WATER MANAGEMENT (VODNYYE PROBLEMY REKI TISY V VENGRII I SOTRUDNICHESTVO STRAN BASSEYNA TISY V OBLASTI VODNOGO KHOZVAYST VA),
I. Degen.
Vodnyye Resursy, No 3, p 3-22, 1973. 12 fig, 4 tab, 3 ref.

Descriptors: *River basins, *Watersheds(Basins), *Watershed management, *Water management(Applied), Flood control, Irrigation operation and maintenance, Reservoir operation, Water resources, Water demand, Water supply, Water utilization, Water quality, Maps.
Identifiers: USSR, *Hungary, *Tisza River.

The Tisza River--the largest left-bank tributary of the Danube--flows through the Soviet Union, Rumania, Czechoslovakia, Hungary, and Yugoslavia. The area of the Tisza drainage basin is 157,000 sq km, and the length of the river is about 1,000 km. Orographically, the river basin is divided into two parts: the mountainous part (absolute elevation--1,800-2,000 m), and the lowland part (elevation--200 m; area--80,000 sq km). Droughts, flood damage, and lack of satisfactory sites for storage reservoirs are typical of the Hungarian part of the Tisza basin and determine the magnitude of the basin's water management problems. To resolve these problems, plans are underway to strengthen levees, improve channel conditions of the Tisza River, and construct new reservoirs in different parts of the basin. Basic characteristics of the water regime of rivers in the Tisza basin and effects of human activity on it are discussed, and expansion of international cooperation among socialist countries in developing the water management of the Tisza basin is urged. EFFECT OF THE FOREST ON THE DISPLACEMENT OF THE DESNA RIVER BED AND THE SIGNIFICANCE OF THIS EFFECT ON FOREST PLANTING IN THE FLOODPLAIN, (IN RUSSIAN),
L. V. Lesovskaya.
Lesovod Agrolesomelior Resp Mezhved Temat Nauchn Sb. 20. p 120-125, (1970).
Identifiers: Conversion, *Desna River bed, Displacement, *Erosion, Europe, *Floodplains, *Forest planting, Land, Plantation, *River beds.

Regularities were revealed in the influence of the riverrain forests on the development of meanders and the magnitude of the conservation of the floodplain lands. No aging of meanders occurs in the zones of influence of the forest meander. Pecularities of the development of meander systems are singled out according to their position in relation to the afforested area. The results obtained are of a theoretical interest and have a practical significance for establishing the most rational arrangement of riverrain plantations, as well as for calculating the speed of river bed erosion of the Desna River type of floodplain.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF LONG-TERM APPLICATION OF VARIOUSLY HIGH RATES OF NUTRIENTS ON NATURAL GRASSLAND SWARDS,
O. Tomka, and E. Lihan.
Ved Pr Vysk Ustavu Luk Pasienkov Banskej Bystrici. 8: p 21-31. 1972. Illus. (English summary).
Identifiers: Agropyron-repens, Alopecurus-pratensis, Crop, *Grasslands, *Legumes, Nitrogen, *Nutrients, Phosphorus, Production rates, *Swards.

The nutrient rates were 50-250 kg N/ha in 2 different ratios of N:P:K. When 100 kg N/ha was applied the legumes disappeared from the sward. At 100 kg/ha and above, Alopecurus pratensis increased on valley meadows, in a hill-land region on soils with an unstable water regime. After 8-10 yr, growth of Agropyron repens started on all locations. The production on meadow crops increased up to the highest application rate. With higher rates of P and N the yield increased only slightly.--Copyright 1973, Biological Abstracts, Inc.

PRODUCTION ABILITY OF LEGUMES, GRASSES AND THEIR MIXTURES IN HILL-LAND REGIONS,
J. Kasper.
Ved Pr Vysk Ustavu Luk Pasienkov Banskej Bystrici. 8: p 71-81. 1972. (English summary).
Identifiers: Climates, Dactylis-glomerata, *Grasses, Hill lands, *Legumes, Lotus-corniculatus, Medicago-sativa, Mixtures, Moisture, *Production, Trifolium-pratense, *Nitrogen, *Nutrients.

The productivity of different legume-grass mixtures and monocultures of legumes (Trifolium pratense, Medicago sativa, Lotus corniculatus) and grasses (Dactylis glomerata) was investigated at different levels of N nutrition (0, 20, 50, 100, 150, 200 kg/ha pure nutrients). Legume-grass mixtures provided higher yields of dry matter than the monocultures of legumes. Orchard grass was a strong competing species; itjprevented the encroachment of weeds. Its proportion rose from 10-16% (first utility yr) to 64-76% (sixth utility yr). Cultivation of monoculture grass stands was justified only at an application rate not lower than 200 N. At lower rates the legume-grass mixtures provided a higher production. The production potential was strongly influenced by climatic and moisture conditions. Monoculture grass swards at higher rates of N provided more balanced and secure yields than legume-grass swards rich in legumes.--Copyright 1973, Biological Abstracts, Inc.

POWER LAW DEPENDENCE ON TIME OF RIVER FLOOD DECAY AND ITS RELATIONSHIP TO LONG-TERM DISCHARGE FREQUENCY DISTRIBUTION,
California Univ., Los Angeles. Dept. of Planetary and Space Science.
G. Schubert, and R. E. Lingenfelter.
Water Resources Research, Vol 10, No 1, p 98-102, February 1974. 4 fig, 1 tab, 5 ref. NASA Grant NGL 05-003-404.

Descriptors: *Flood forecasting, *Recession curves, *Flood frequency, Probability, Streamflow forecasting, Hydrograph analysis, Duration curves.

River discharge frequency distributions, based on long-term records of daily streamflow, often have an inverse power law dependence on discharge. This reflects the recession of individual river floods, which have an inverse power law dependence on time with an exponent of l/(s + l), where s is the slope of the power law dependence on discharge of the river discharge frequency distribution. This relationship allows forecasting of river discharges with about 5% uncertainty for as much as 30 days after flood peaks. (Knapp-USGS)

VERIFICATION OF WATER TEMPERATURE FORECASTS FOR DEEP, STRATIFIED RESERVOIRS,
Oregon State Univ., Corvallis. School of Oceanography.
W. V. Burt.
Water Resources Research, Vol 10, No 1, p 93-97, February 1974. 4 fig, 11 ref.

Descriptors: *Water temperature, *Reservoirs, *Thermal stratification, Forecasting, Climatology, Heat budget, Discharge(Water), Northwest U.S.

Systems are available for forecasting downstream water temperatures for water passing through manmade impoundments. Two forecasts were made for deep, stratified reservoirs in the Northwest. The forecasts were made before the dams had been constructed. Water temperature observations made below the dams after they were constructed are compared with the original forecasts. In both cases the forecasts agreed very well with the observations. A forecast for a high dam and a reservoir with near-surface outlets is also compared with observed temperatures, but this agreement is not as good as that for the reservoirs with low outlets. (Knapp-USGS)

A STUDY ON THE ACCURACY OF RUNOFF ANALYSIS FOR PUMPING DRAINAGE IN PADDY FIELD AREA (IN JAPANESE),
Shimane Univ., Matsue (Japan). Faculty of Agriculture.
R. Tanaka.
Bull Fac Agric Shimane Univ. 5. p 71-75, 1971, Illus, English summary.
Identifiers: *Drainage, *Paddy field, Pumping, Runoff analysis, *Hydrographs.

In a paddy field area, a runoff hydrograph under rainstorm usually tends to have an extremely smooth shape and long period of runoff because of storage and flood. Therefore, the unit time and the basic rainfall to be used for runoff analysis of pumping drainage should be decided after general consideration based on these characteristics. Investigations in a paddy field area of Anba river near Lake Shinji, Shimane Prefecture (Japan), indicated the reasonable unit time for runoff analysis is about 6 hr and a 3-day storm should be used as the basic rainfall.--Copyright 1973, Biological Abstracts, Inc.

J. R. Chalmers.
Available from the National Technical Information Service as PB-228 130, $6.00 in paper copy, $1.45 in microfiche. Arid Lands Resource Information Paper, No. 4, 1974. 229 p, 18 fig, 10 tab, 1 map, 180 ref. OWRR W-161 (No 9071) (1). 14-31-0001-9071.

Descriptors: *Groundwater, *Judicial decisions, *Legal aspects, *Southwest U.S., *Water law, Arizona, California, Colorado, Nevada, New Mexico, Texas, Utah, *Bibliographies, Conjunctive use, Groundwater mining, Institutional constraints, Irrigation water, Overdraft, Pumping, *Prior appropriation, Reasonable use, Surface-groundwater relationships, *Water rights, Water allocation(Policy), Water management(Applied), Water resources development.
Identifiers: Correlative rights, English rule, Agricultural use of water, Critical groundwater areas.

An attempt is made to bring together up-to-date information on the interpretation of groundwater law doctrines and applied water management policies in the southwestern states of Arizona, California, Colorado, Nevada, New Mexico, Texas, and Utah, where none is able to meet present water demand from surface supplies. The resulting mining of groundwater, largely to meet irrigation needs, is creating a critical situation that each of the states covered seeks to meet in a variety of ways. The doctrines of correlative rights, the English common law, prior appropriation and its contemporary modifications, are discussed, state by state. While Arizona has been selected to serve as a case study to put the problem of a diminishing groundwater supply in perspective, there is also a chronological survey of the development of groundwater rights law for each of the states. A final chapter deals with the concept of a statutory revision of Arizona's code, with a modified prior appropriation doctrine recommended. Appended is a 180-item computerized annotated bibliography. (Paylore-Arizona)

THE NEED OF GEOLOGICAL INVESTIGATIONS FOR THE DEVELOPMENT OF THE GROUND WATER RESOURCES OF THE REPUBLIC OF KOREA,
Geological Survey, Reston, Va. Water Resources Div.
J. T. Callahan, and Il Choi Seung.

Journal of the Geological Society of Korea, Vol 9, No 1, p 24-29, March 1973.

Descriptors: *Geologic mapping, *Hydrogeology, *Exploration, *Foreign research, *Groundwater, Mapping, Data collections, Hydrologic data.
Identifiers: *Republic of Korea.

The exploration for and inventory of the groundwater resources of Korea should be based on geologic maps of scale ranging from 1:50,000 to 1:10,000. The different rock formations must be delineated and classified according to the depth of well drilling needed, the yield of the rocks to wells, and the chemical quality of the contained groundwater. The investigation of the groundwater resources of Korea has only begun. The work necessary to fully define and develop the resources will require the efforts of many geologists during the coming three decades. (Knapp-USGS)

RECONNAISSANCE OF THE GROUND-WATER RESOURCES OF CIMARRON COUNTY, OKLAHOMA,
Geological Survey, Washington, D.C.
D. B. Sapik, and R. L. Goemaat.
For sale by U.S. Geological Survey 20242, Price $1.25 per set. Hydrologic Investigations Atlas HA-373, 1973. 3 sheets, 3 map, 1 tab, 17 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water quality, *Oklahoma, Water utilization, Irrigation, Water supply, Water wells, Water level fluctuations, Water yield, Groundwater recharge, Water analysis, Chemicals, *Mapping, Geology, Hydrographs, Hydrologic data.
Identifiers: Cimarron County(Okla).

Groundwater resources are described for Cimarron County in the Oklahoma Panhandle. The county depends almost entirely on groundwater for its water supply. Where present, the Ogallala Formation is the principal aquifer. The western half of the county is also underlain by the Dakota Sandstone and the Cheyenne Sandstone Member of the Purgatoire Formation, both of which may yield enough water for irrigation. As a result of accelerated development of groundwater for irrigation that began in 1955, water levels in the Ogallala have declined in a few areas of the county. During 1966 about 70,300 acres were irrigated with groundwater. Assuming an average application of 1.2 acre-feet per year per acre, groundwater pumpage for irrigation during 1966 was estimated to be 80,000 acre-feet. This estimate illustrates the magnitude of increase in pumpage over the 175 acre-feet per year estimated for 1938-40. In some parts of Cimarron County the dissolved-solids and fluoride content of groundwater exceed standards set by the U.S. Public Health Service for domestic use. (Woodard-USGS)

ECONOMIC ASPECTS OF GROUND WATER RESOURCES AND REPLACEMENT FLOWS IN SEMIARID AGRICULTURAL AREAS,
New Mexico Univ., Albuquerque.
M. Gisser, and A. Mercado.
American Journal of Agricultural Economics, Vol 55, No 3, p 461-466, August 1973. 2 fig, 14 ref.

Descriptors: *Groundwater management, *Irrigation water, *Project planning, *Economic feasibility, *Water demand, Hydrologic aspects, *Semiarid climates, Agriculture, Aquifers, Artificial recharge, Alternative planning, Costs, Mathematical models, Systems analysis, Profit, Optimimum development plans.
Identifiers: *Replacement flow.

In semiarid areas where farmers are faced with falling water tables, hydrology and economics must be combined in an integrated model. A single cell hydrologic model of an aquifer in a semiarid region is integrated with an agriculture (linear) negatively sloped demand function for irrigation water. Groundwater and replacement flow are charged artificially into the ground. The aquifer benefits from a significant natural recharge and loses water via natural discharge, which is functionally related to water level. Concern is with the long-run steady-state solutions characterized by an eventual equilibriim in which, if necessary, with the help of artificial recharge, overdraft is reduced to zero. Essentially, the economic problem is to select the replacement flow project that will leave the farm with the maximum profit (net income) and an aquifer that is in steady state. Given pumping and replacement flow costs, only one project (as proposed to a variety) yields simultaneously maximum profit and steady-state solution. The model presented can aid policy makers in solving problems from overdraft leading to a falling water table and in examining the profitability of importing water from surplus areas and artificially recharging the aquifer. GROUND WATER AND THE GEOTHERMAL RESOURCE.
Geraghty and Miller, Port Washington, N.Y.
Special Report, September 1973. 14 p, 8 fig.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, *Reviews, Heat flow, Thermal power, *Groundwater.
Identifiers: *Geothermal power.

Groundwater is one of the two basic ingredients in the geothermal energy resource. Most of the hot waters and steam in known geothermal systems are of meteoric origin and not produced from magmas as had been thought previously. Thus, the water involved is ordinary groundwater and the quantity available in a geothermal system is determined by the same geologic factors that control the occurrence and movement of all subterranean waters. Heat is the other basic ingredient and its position and quantity in relation to the available groundwater determines the character of the geothermal resource and eventually its usefulness to man. (Knapp-USGS)

AVAILABILITY OF GROUND WATER IN THE WINNSBORO AREA, LOUISIANA,
Geological Survey, Baton Rouge, La.
M. S. Whitfield, Jr.
Louisiana Department of Public Works Water Resources Special Report No 1, December 1973. 9 p, 1 fig, 1 plate, 2 tab.

Descriptors: *Groundwater, *Water quality, *Louisiana, *Iron, Hardness(Water), Water yield, Withdrawal, Water levels, *Alluvial aquifers, *Chlorides.
Identifiers: Winnsboro(La).

Sand and gravel deposits of the Mississippi River alluvial aquifer are 80-100 feet thick in the Winnsboro area of Louisiana and yield as much as 4,000 gallons of water per minute. In most of the area the groundwater is hard to very hard and has a high iron concentration. Chloride concentrations have increased from 62 mg per liter in early 1960 to 436 mg per liter in October 1973. This change is apparently related to increased pumpage in the Winnsboro well field over the past 20 years. (Knapp-USGS)

A DESIGN PROCEDURE FOR THE CONJUNCTIVE USE OF SURFACE AND GROUNDWATER STORAGES,
New South Wales Univ., Kensington (Australia).
P. R. Johnston, E. M. Laurenson, and D. T. Howell.
Australian Water Resources Council Technical Paper No 3, 1973. 40 p, 16 fig, 4 tab, 2 map, 33 ref. Research Project 68/12.

Descriptors: *Conjunctive use, *Water storage, *Australia, *Dynamic programming, *Surface-groundwater relationships, Water yield, Planning, Water resources development, Water management(Applied), *Optimum development plans, Design criteria.
Identifiers: Hunter Valley(NSW-Australia).

A procedure was developed for determining the optimum development for surface water and groundwater in a valley. The optimum size for the surface reservoir, the required number of bores or wells, and sizes of other components were determined in the Upper Hunter Valley, New South Wales, Australia. The procedure was based on the use of dynamic programming. The procedure could be used for the design of a system required to satisfy either an agricultural or urban demand. It could also be used as part of a procedure to solve a larger problem, where the aim is not merely to determine a least cost design for a given target level of water supply, but to decide on an optimal level of water supply to maximize net benefits. Because inadequate data are likely to be available for the design of a new system, the method may find more application in the design of modifications to existing systems. (Knapp-USGS)

GROUND-WATER DATA FOR HARRIS COUNTY, TEXAS: VOLUME I. DRILLERS' LOGS OF WELLS, 1905-71.
Geological Survey, Austin, Tex.
Texas Water Development Board Report 178, November 1973. 421 p, 1 fig, 5 ref.

Descriptors: *Drillers logs, *Data collections, *Water wells, *Hydrologic data, *Texas, Discharge(Water).
Identifiers: Harris County(Texas).

The groundwater data-collection program in Harris County, Texas, consists of an inventory of new large-capacity and other selected wells, the collection of water samples from wells for chemical analyses, an inventory of groundwater pumpage, water-level measurements in observation wells, pumping tests on large-capacity wells, and compilation of information on land-surface subsidence. Drillers' logs of approximately 1,200 wells in Harris County that have been collected as part of the inventory from 1905 to 1971. (Knapp-USGS)

ECONOMIC POWER FROM GEOTHERMAL HEAT,
J. H. Anderson.
Reprint: J. Hilbert Anderson - Consulting Engineer, 1615 Hillock Lane, York, Pennsylvania, August 12, 1972, 4 p, 6 fig, 7 ref.

Descriptors: *Electric power production, *Geothermal studies, *Heat transfer, *Heat exchangers, *Design criteria, Heat flow, Gases, Fluids, Heated water, Cost analysis, Construction costs, Well drilling, Feasibility, Waste water disposal, Condensers.
Identifiers: Geothermal energy.

A discussion of geothermal energy is presented which includes consideration of the possibility for its conversion into electrical energy, different techniques to accomplish such a conversion and the general costs involved. Geothermal energy can be an economical source of power if the heat sources are sufficiently close to the surface to allow reasonably easy access. Methods of bringing this heat to the surface for conversion include heated water flow, flashing of superheated water through a cold water zone, and hot water pumped to the surface in connection with a heat exchanger. The latter process eliminates the disadvantages of energy loss and corrosion associated with the first two methods. In the process the hot water is pumped to the surface under pressure to prevent it from flashing into steam. The heat is exchanged to another fluid favorable for vaporization, such as isobutane. The cost of energy per kilowatt-hour depends upon the temperature of the well, the depth of the well and the efficiency of the heat transfer process. Enclosed graphs depict costs per depth of drilling wells, a heat transfer schematic, a performance curve for an isobutane cycle and water rates and thermal efficiency. (Jerome-Vanderbilt)

THE OPERATION OF A STREAM-AQUIFER SYSTEM UNDER STOCHASTIC DEMANDS,
Geological Survey, Reston, Va.
T. Maddock, III.
Water Resources Research, Vol 10, No 1, p 1-10, February 1974. 2 fig, 5 tab, 19 ref.

Descriptors: *Conjunctive use, *Stochastic processes, Statistical methods, *Water demand, Water yield, *Surface-groundwater relationships, Artificial recharge, Drawdown, Withdrawal.

It is possible to develop operating rules for the conjunctive use of surface water and groundwater when the demand and supply sources are stochastic. These rules allow the quantities of water pumped from wells, diverted from streams, spread, and returned to the stream after use to be determined for a given time period even if the required needs and availability of supply are uncertain at the beginning of the time period. These rules are dependent on a technological function relating streamflow interaction with well pumping and with the statistics of the demands, streamflow, pumping, and drawdowns. The discounted expected cost and the operating rules are functions of not only the expected value of the demands but also its variance and persistence (as measured by an autocorrelation function). The discounted expected cost has high sensitivity to demand variances and some sensitivity to persistence. (Knapp-USGS)

CONTROL OF PERMAFROST DEGRADATION BENEATH A ROADWAY BY SUBGRADE INSULATION,
Alaska State Dept. of Highways, College.
D. C. Esch.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 608-622, 1973. 10 fig, 1 tab, 8 ref.

Descriptors: *Permafrost, *Subsidence, *Road construction, *Insulation, *Alaska, Thawing, Consolidation, Peat, Frozen soils, Frozen ground, *Degradation(Slope).

Newly constructed roadways crossing permafrost terrain originally covered with vegetation have the effect of increasing the amplitude of the seasonal surface and subsurface temperature variations and also of altering the mean annual surface temperature. Readjusting of the permafrost table to the new thermal conditions occurs over a period of years. Readjustment is accompanied by roadway surface settlement in areas where permafrost degradation occurs in soils having high frozen moisture contents or segregated ice formations or deposits. The Alaska Department of Highways, in 1969, installed two different thicknesses of extruded polystyrene foam insulation boards beneath a newly constructed roadway in a region of relatively warm permafrost. Roadway fill sections constructed over a frozen peat subgrade, with both 5.1- and 10.2-cm-thick insulation layers, performed very well during the first 3 years after construction, as evidenced by the fact that surface settlement has been very small and very uniform. Adjacent normally constructed fill sections showed the average settlement to be 8 times greater than the 5-cm insulation section and 11 times greater than the 10-cm section, with severe variations in settlement magnitude. CONTROL OF CULVERT ICING,
Cold Regions Research and Engineering Lab., Hanover, N.H.
D. A. Gaskin, and L. E. Stanley.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 629-636, 1973. 7 fig, 1 tab, 4 ref.

Descriptors: *Ice, *Culverts, *Drainage, *Arctic, *Deicers, Permafrost, Melting, Heating.
Identifiers: *Ice control.

The U. S. Army Cold Regions Research and Engineering Laboratory conducted field and laboratory studies from 1966 to 1971 as a joint research project with the Alaska Department of Highways and the U.S. Department of Transportation on the prevention and control of culvert and road icing. A laboratory study was made of culvert icing control using electric heat cables. The major heat transfer mechanism for melting and maintaining an open, freely draining hole in a culvert subject to groundwater icing is convection. This implies that the optimum location for the cable is near the bottom of the culvert, where the largest cross-section hole can be melted without thawing the frozen soil that surrounds the culvert. A proportional controller system was useful for spring icing problems. The sensor can be placed downstream of the problem drainage structure and an electric heat cable installed. When the system is energized, it will keep the water continuously flowing through the drainage structure above the freezing point and so minimize or eliminate the culvert icing blockage. W74-04411

SOME EFFECTS OF SURFACE DISTURBANCE ON THE PERMAFROST ACTIVE LAYER AT INUVIK, N.W.T., CANADA,
Geological Survey of Canada, Ottawa (Ontario).
J. A. Heginbottom.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 649-657, 1973. 6 fig, 3 tab, 15 ref.

Descriptors: *Permafrost, *Environmental effects, *Erosion, *Thawing, Canada, Frozen soils, Subsidence, Soil engineering, Soil strength, Soil mechanics.

In permafrost active layer in the forest-tundra environment of northern Canada, the effects of disturbance of the ground surface on the active layer were studied. This information is used in the production of guidelines and regulations to minimize some of the undesirable effects of land use and northern development. The structure of the active layer in this area is an important factor. The most obvious feature of the ground surface in

the Inuvik area is its hummocky nature. The upper layer of the ground is a complex of mineral soil hummocks separated by shallow, moss-filled trenches. The hummocks are composed of a dense, grey-brown clay-silt, showing little or no soil profile development. In undisturbed areas, some hummocks have mineral soil exposed at the surface, but most are covered with a thin layer (less than 5 cm) of humus, mosses, and lichens. The one factor that overrides all others in controlling the effects of any terrain disturbance on the permafrost active layer is the intensity or severity of the original distrubance. Variations in the response of the terrain due to different original terrain conditions are much less. (See also W74-04346) (Knapp-USGS)

CORPS OF ENGINEERS TECHNOLOGY RELATED TO DESIGN OF PAVEMENTS IN AREAS OF PERMAFROST,
Corps of Engineers, Washington, D.C.
F. B. Hennion, and E. F. Lobacz.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 658-664, 1973. 1 fig, 8 ref.

Descriptors: *Permafrost, *Frost heaving, *Road construction, Design, Thawing, Freezing, Subsidence.

Design of pavements subject to seasonal thaw-freeze cycles is based on either of two basic concepts: control of surface deformation resulting from frost action, or provision of adequate bearing capacity during the most critical climatic period. Waterproofing membranes may be used to protect dry high-density fine-grained soil layers from water infiltration and subsequent loss of strength. Membrane encapsulated soil layers (MESL) may be used in permanent pavement systems. In August 1970, an MESL test section was constructed at the Army Cold Regions Research and Engineering Laboratory Alaska Field Station using Fairbanks silt as the embankment encapsulated soil. The section has a length of 76 m, a traffic surface width of 6-6.7 m, and a thickness from 0 to 0.9 m. Both top and bottom membranes are polypropylene waterproofed with a single hand application of about 2.2 cubic decimeters per sq m of emulsified asphalt. The MESL concept appears to be a feasible method of utilizing local, normally unsatisfactory materials as replacements for clean granular base and subbase coarse materials. Moisture migration in thick silty encapsulated layers presents a design problem; however, this can be minimized by utilizing horizontal moisture barriers (probably formed in place). LONG-TERM EFFECTS OF VEGETATIVE COVER ON PERMAFROST STABILITY IN AN AREA OF DISCONTINUOUS PERMAFROST,
Cold Regions Research and Engineering Lab., Hanover, N.H.
K. A. Linell.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 688-693, 1973. 4 fig, 2 tab, 10 ref.

Descriptors: *Permafrost, *Subsidence, *Thawing, *Vegetation effects, Forests, Tundra, *Alaska, Arctic, Frozen soils, Frozen ground, Soil physical properties, Soil mechanics.

The relationship between vegetative cover and permafrost degradation was studied at Fairbanks, Alaska. The data extend through 1972, 26 years after the start of the experiment. The terrain at the station has a comparatively smooth, gentle slope to the west, providing good surface drainage except at the lowest elevations where swampy conditions exist. The ground under the station is permanently frozen, with the depth of permafrost approaching 60 m. Only the original densely tree covered section has remained free from permafrost degradation. In both the cleared and stripped sections, permafrost degradation is still continuing, though at a distinctly slower rate than in the area that was only cleared. In an environment like that at Fairbanks the maintenance or re-establishment of a random, mixed-type low vegetative cover cannot be counted on to stop or prevent permafrost degradation in an area subject to surface disturbance. W74-04417

ENCOUNTERING MASSIVE GROUND ICE DURING ROAD CONSTRUCTION IN CENTRAL ALASKA,
Cold Regions Research and Engineering Lab., Hanover, N.H.
N. Smith, and R. Berg.
In: International Conference in Permafrost 2nd, Yakutsk, USSR 1973. p 730-736, 1973. 17 fig, 4 ref.

Descriptors: *Permafrost, *Road construction, Excavation, *Alaska, Arctic, Thawing, Revegetation.

Several cuts along a new roadway in Central Alaska had exposed massive ice inclusions and wedges. Eight relatively deep cuts were made in high ice content soils. Guidelines are given for making cuts through ice-rich soils: avoid north-facing slopes when possible; make vertical backslopes on cuts; provide a wide ditch at the base of the cut to allow removal of material if necessary to allow deposition of some overlying material during the stabilization process; and clear trees and brush from the top of the slope to a distance about equal to the height of the slope. EFFECTS OF GROUND-ICE VARIABILITY AND RESULTING THAW SETTLEMENTS ON BURIED WARM-OIL PIPELINES,
Mackenzie Valley Pipeline Research Ltd., Calgary (Alberta).
T. L. Speer, G. H. Watson, and R. K. Rowley.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973. p 746-752, 1973. 5 fig, 2 tab, 6 ref.

Descriptors: *Permafrost, *Subsidence, Frozen soils, Soil types, *Canada, Arctic, Frost heaving, Ice, Soil mechanics, *Pipelines, *Oil fields.

Field and laboratory studies were undertaken to determine the type and variability of ground ice occurring in clay and silt permafrost soils and to establish limiting pipe burial criteria. Specific objectives were to derive a general relationship between frozen bulk density and thaw settlement for permafrost mineral soils; to determine the ice variation for specific terrains in which the proposed pipeline might be buried; to determine the representative potential total and differential settlements for these specific terrains; and to establish a method of using both the frozen bulk density and thaw settlement data (total and differential) obtained to establish practical design limits for a warm buried pipeline. EFFECTS OF URBANIZATION ON FLOODS IN THE DALLAS, TEXAS, METROPOLITAN AREA,
Geological Survey, Austin, Tex.
G. R. Dempster, Jr.
Water-Resources Investigations 60-73, January 1974. 55 p, 10 fig, 11 tab, 11 ref.

Descriptors: *Urban hydrology, *Urban runoff, *Texas, *Mathematical models, Rainfall-runoff relationships, Peak discharge, Regression analysis, Flood frequency.
Identifiers: *Dallas(Tex).

The effects of urbanization on flood characteristics of streams in the Dallas metropolitan area were studied by use of a digital model of the hydrologic system. The model was calibrated by using observed rainfall and runoff data from 19 storms in six basins having various degrees of urbanization. The calibrated models were used with a 57-year rainfall record to simulate 57-year records of annual peak discharges in 14 basins. The flood-frequency characteristics were defined by fitting the simulated 57-year records to log-Pearson Type III distributions. Regional peak discharge equations, which can be used to determine the maximum rates of discharge that could be expected to be equaled or exceeded on the average of once in 1.25, 2, 5, 10, 25, and 100 years, were derived from multiple-regression analyses. The relationships among flood frequency, drainage area, and a coefficient of impervious area are given in a nomograph. In a fully developed residential area, the flood peaks will be 1.2 to 1.4 times those from an undeveloped area, and the annual direct runoff will be about double that from an undeveloped area. URBANIZATION: A HYDROLOGICAL HEADACHE,
Lund Inst. of Tech. (Sweden).
G. Lindh.
Ambio. Vol 1, No 6, p 185-201. 1972. Illus.

Identifiers: Ground water, *Hydrological cycle, Mathematical methods, Statistical studies, *Urbanization, Water balance, *Water quality, *Water quantity.

Urbanization disrupts the natural hydrological cycle and creates problems concerning the quality, quantity and distribution of water. Urbanization causes changes in the microclimate, the ground's hydrological response, the quality and quantity of groundwater, and the water balance. Urbanization often makes it necessary to transfer water from other regions. There is presently a great need for research on urban hydrology. The use of statistical mathematical methods, especially systems analysis, has spurred progress in certain areas of hydrology.--Copyright 1973, Biological Abstracts, Inc.

Vodnyye Resursy, No 3, p 171-174, 1973. 7 ref.

Descriptors: *Mudflows, *Sediment control, Damages, Forecasting, Planning.
Identifiers: *USSR.

Mudflows are widespread in many mountainous and piedmont regions of the Soviet Union. Mudflows occur most frequently in the Caucasus, Transcaucasus, Tien-Shan, Karatau, Kopet-Dag, the Baykal region, the Crimea, and the Carpathians. Mudflows also form in the Polar Urals, the Khibiny Mountains and on the Central Siberian Plateau, Sakhalin, and Kamchatka. According to incomplete figures, over 5,000 cases of mudflows have already been recorded in the Soviet Union. In mountainous and piedmont regions of the Caucasus and Soviet Central Asia mudflows have caused extensive damage to railroads, including the Transcaucasus, Azerbaydzhan, Ashkhabad, Tashkent, and Kazakh lines. Mudflow control is divided into active measures aimed at preventing formation of catastrophic mudflows and passive measures designed to control mudflows by incorporating an additional storage volume in reservoirs for sediment accumulation or by diverting mudflows to areas of lesser economic significance. Mudflow control in the Soviet Union (and abroad) is divided into (1) engineering measures and (2) afforestation and phytomeliorative measures. It is estimated that by 1980 about 670 million rubles will have been spent on combating mudflows and floods in the Soviet Union. Some common features of mudflow deposits and conditions favoring their formation are examined. (Josefson-USGS)

Descriptors: *Remote sensing, *Aerial photography, *Mapping, *Sampling, Lakes, Streams, Design, *Tennessee, Water quality.
Identifiers: *Fort Loudoun Reservoir(Tenn.).

This project was intended to investigate the use of remote sensing techniques in the design of sampling programs on large lakes and streams. The wide overview of aerial photography and infrared thermal mapping scanners provide means of visualizing and measuring variations in water characteristics which might require compensation for representative sampling. Several sites on Fort Loudoun Lake were sampled to determine whether persistent patterns of water quality variations existed. The parameters measured were temperature, measured with a Barnes Radiometer, turbidity and color. Persistent patterns were found in the vicinity of tributary inflows and it was concluded that aerial techniques would be useful in mapping the extent and shape. The Project was terminated before significant aerial imagery could be acquired.

Descriptors: *Monitoring, *Nuclear powerplant, Effluents, *Radioactivity, Air pollution, Water pollution, Fallout, *Wisconsin, Surveys, Measurement, Instrumentation, *Lake Michigan, Public health, *Remote sensing.

The Aerial Radiological Measuring System was used to survey the area surrounding the Point Beach Nuclear Plant during August 1970. The survey measured terrestrial gamma radiation. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 312-square-mile area showing isoexposure contours three feet above the ground. Exposure rates and isotopes identified are consistent with normal terrestrial background. (Houser-ORNL)

APPROACHES TO STORMWATER MANAGEMENT,
Hittman Associates, Inc., Columbia, Md.
B. C. Becker, M. L. Clar, and R. R. Kautzman.
Available from the National Technical Information Service as PB-228 124, $6.75 in paper copy, $1.45 in microfiche. Completion Report, HIT-563, November 1973. 258 p, 66 fig, 17 tab, 90 ref. OWRR C-4140(No 9025) (1).

Descriptors: *Storage, *Storm runoff, *Flood control, *Detection reservoirs, *Water pollution control, *Design storm, Flood routing, Watershed management, Design criteria, Reviews, Bank storage, Reservoir storage, Underground storage flood hydrology, Urbanization, Retention reservoirs, Erosion control, Flood damage.
Identifiers: *Stormwater management, Storm water detection/retention.

The literature was searched to identify the various techniques, past and present, utilized for the control of stormwater management. Fifteen different basic techniques for stormwater management were selected and grouped under 3 categories: surface detention, subsurface detection, and infiltration systems. The presentation includes a description of the technique, a discussion of its applicability, an example of an actual application where available, and a brief review of the available design, maintenance and construction considerations. Needs for planning, design, maintenance and institutional considerations of stormwater management, are described.

MASS SPECTROMETRY AND INHOMOGENEOUS ION OPTICS,
Rensselaer Polytechnic Inst., Troy, N.Y.
F. A. White.
Available from NTIS, Springfield, Va 22151 NASA CR-2253 Price $4.50 (domestic), $7.00 (foreign); $1.45 microfiche. National Aeronautics and Space Administration Contractor Report CR-2253, November 1973. 127 p, 47 fig, 1 tab, 30 ref. NASA Contract NGL 33-018-053.

Descriptors: *Mass spectrometry, *Pollutant identification, Heavy metals, Trace elements, *Analytical techniques, Ions, Air pollution, Water pollution, Oxides, *Ionization, *Isotope fractionation.
Identifiers: *Metallic oxides.

Magnetic mass spectrometers were studied for use in measuring air and water pollution. The calculations and data necessary for the design of inhomogeneous field mass spectrometers, and the calculation of ion trajectories are presented. Solid state ion detection devices were tested for capability of counting single ions. New techniques in the preparation and operation of thermal-ionization ion sources are described. Data were obtained on the concentrations of copper in rainfall and uranium in air samples using the improved thermal ionization techniques. A closed system static mass spectrometer was designed for isotopic analyses. Instrumental aspects of a four-stage mass spectrometer comprising two electrostatic and two 90 deg magnetic lenses with a 122-cm radius used to study the interaction of ions with solids are summarized. Descriptors: *Remote sensing, *Air pollution, *Satellites(Artificial), Fluorescence, Spectroscopy, Infrared radiation, Aerosols, *Pollutant identification.

Pollutants can be observed from satellites by either active or passive remote sensing systems. Tropospheric CO, CO2, SO2, NO2, NH3, HCHO, and CH4 can be measured by means of nadir-looking passive systems. Additional species such as NO, HNO3, O3, and water may be measured in the stratosphere through a horizon view. A brief theoretical overview of resonance Raman scattering and resonance fluorescence is given. Several techniques for measuring aerosol in a nadir-looking experiment are examined. Radiance measurements are most promising for general global applications. Stratospheric aerosol may be measured using a sun occulation technique. The instrumentation requirements for both active and passive systems are examined and various instruments under development are described. (Knapp-USGS)

DETERMINATION OF CHROMIUM IN SEA WATER BY ATOMIC ABSORPTION SPECTROMETRY,
New England Aquarium, Boston, Mass. Research Dept.
T. R. Gilbert, and A. M. Clay.
Analytica Chimica Acta, Vol 67, No 2, p 289-295, Dec. 1973. 2 fig, 3 tab, 9 ref.

Descriptors: *Water analysis, *Pollutant identification, *Chromium, *Sea water, Analytical techniques, *Spectroscopy, Oxidation.
Identifiers: Atomic absorption spectrometry, Wet combustion, Sample preparation(For analysis).

A method for determining Cr in sea water with minimum sample preparation involves oxidation of Cr in the filtered sample with potassium permanganate, followed by extraction with ammonium pyrrolidine dithiocarbamate into MIBK (methyl isobutyl ketone), and atomic absorption spectrometry in a fuel-rich air-acetylene flame. Nonfilterable solids are extracted with 12M HCl and analyzed separately. Detection limits of this technique are 0.05 microgram/liter in the liquid and 0.06 microgram/liter in the particulate phase. (Brown-IPC)

THE ANALYSIS OF ARSENIC IN THE LIPID PHASE FROM MARINE AND LIMNETIC ALGAE,
Central Inst. for Industrial Research, Oslo (Norway).
G. Lunde.
Acta Chem Scand. Vol 26, No 7, p 2642-2644, 1972, Illus.
Identifiers: *Arsenic, Chlorella-Ovalis, Chlorella-Pyrenoidosa, *Limnetic algae, *Marine algae, Oscillatoria-Rubescens, Phaeodactylon-Tricornutum, Sceletonema-Costatum *Algae(Liqud phase), Neutron activation analysis, *Pollutant identification.

The arsenic content in the lipid phase extracted from selected marine and limnetic algae was analyzed by use of neutron activation technique. The arsenic content varied from about 0.5 ppm to 5 ppm. The algae were cultivated in the laboratory using enriched cultures. The following types of algae were investigated: Chlorella ovalis Butcher, Chlorella pyrenoidosa Chick, Oscillatoria rubescens (DC), Phaeodactylon tricornutum Bohlin, and Sceletonema costatum (Grev.) Cleve.--Copyright 1973, Biological Abstracts, Inc.

OVERGROWTH OF OOZE IRON-MANGANESE MICROORGANISMS STUDIED BY ELECTRON MICROSCOPY, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Institut Ozerovedeniya.
R. S. Kutuzova, D. R. Gabe, and I. M. Kravkina.
Mikrobiologiya. Vol 41, No 6, p 1099-1102. 1972, Illus, (English summary).
Identifiers: *Electron microscopy, *Iron manganese microorganisms, *Metallogenium, Microorganisms, Ooze, *Siderococcus, Iron bacteria.

Overgrowth of ooze iron-manganese microorganisms (Metallogenium and Siderococcus) in slotted peloscopes was studied by electron microscopy. A band, covered with a film of collodion or carbon, was inserted between glass bands of the peloscope. Microorganisms, overgrowing the films, were transferred together with the film on copper nets and studied by electron microscopy without any further treatment. The preparations were made by the replica technique when microorganisms overgrew the glass surface of the peloscopes.--Copyright 1973, Biological Abstracts, Inc.

ANALYTICAL TECHNIQUES FOR THE DETERMINATION OF PETROLEUM CONTAMINATION IN MARINE ORGANISMS,
Woods Hole Oceanographic Institution, Mass.
J. W. Farrington.
Available from NTIS, Springfield, Va 22151 as AD-766 792, Price $3.00 printed copy; $1.45 microfiche. Technical Report WHOI-73-57, September 1973. 24 p, 1 fig, 89 ref. ONR Contract N00014-66-C0241 NSF Grant GA-35646.

Descriptors: *Pollutant identification, *Analytical techniques, *Chromatography, *Gas chromatography, Fluorometry, *Chemical analysis, *Spectrophotometry, Spectroscopy, Infrared radiation, Fluorescence, Ultraviolet radiation.
Identifiers: Marine organisms.

The composition of hydrocarbons in petroleum and the composition of hydrocarbons isolated from marine organisms were studied to select the best analytical techniques for the quantification of petroleum contamination in marine organisms. Analytical techniques discussed include column, thin layer, and high pressure liquid chromatography; I. R., U. V., and U. V.-fluorescence spectrometry; gas chromatography; mass spectrometry; and combinations of methods. Each technique provides information in some of the categories of characteristics for petroleum hydrocarbons. Gas chromatography provides information about the complexity and molecular weight range. It also detects the presence or absence of certain homologous series. In addition, gas chromatography provides the information about native hydrocarbons and their absolute and relative abundance. Careful application of the suggested techniques will provide information about the presence or absence of petroleum contamination in marine organisms and also provide an estimate of the severity of contamination. THIN-LAYER AND GAS-CHROMATOGRAPHIC DETERMINATION OF PHENOLS PRESENT IN WATER, (IN GERMAN),
Mainz Univ. (West Germany). Hygiene Institut.
H. Kunte.
Zentralbl Bakteriol Parasitenkd Infekionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. Vol 155, No 1, p 41-49. 1971. Illus. (English summary).
Identifiers: *Chromatographic analysis, *Gas chromatography, *Phenols, Water analysis, Pollutant identification, Thin-long chromatography.

A method is described by which organic substances are extracted with isopropylether from a 10 l sample of water in a multiple 'cascade distribution process.' The phenolic compounds are separated by extraction with KOH solution and after acidification transferred into ethyl acetate. The ester is concentrated in vacuo and gas chromatographed, the effluent gas stream is directed onto thin-layer plates for further separation and identification. With this method 15 different compounds can be determined qualitatively and quantitatively down to 0.2 microgram/liter.--Copyright 1973, Biological Abstracts, Inc.

DETERMINATION OF MICROGRAM QUANTITIES OF POLYETHYLENE POLYAMINES IN WATER, (IN RUSSIAN),
G. S. Salyamon, and N. A. Petrova.
Gig Sanit. Vol 37, No 5, p 59-63. 1972.
Identifiers: *Amines, Colorimetry, Quinones, Reagents, Water pollution, *Pollutant identification, *Imines, *Colorimetric analysis, Microgram quantities.

The sensitivity of colorimetric analysis of polyamines, based on interaction with eosin and copper sulfate, increases with a decrease in pH of the medium. By adding citrate buffer solution, pH 2.5-2.7, it reaches 0.006 mg/l for polyethyleneimines (PEI) and 0.02-0.2 mg/l for polyethylene polyamines (PEPA). The Cu-eosin reagent permits analysis of high-molecular PEPA in the presence of low-molecular PEPA. Total high-molecular ethyleneamines and low-molecular amines can be determined colorimetrically using p-nitrodiazobenzene. PEPA can be analyzed in the presence of PEI using the known colorimetric reaction for secondary amines with 1,2-naphthoquinone-4-sodium sulfonate. The sensitivity is high (0.02 mg/l).--Copyright 1973, Biological Abstracts, Inc.

RELATIVE EFFICIENCY OF CELL CULTURES FOR DETECTION OF VIRUSES,
Washington Univ., Seattle. School of Public Health and Community Medicine.
M. K. Cooney.
Health Laboratory Science, Vol 10, No 4, p 294-302, October 1973. 8 tab, 10 ref.

Descriptors: *Viruses, *Cultures, *Pollutant identification, *Isolation.
Identifiers: Adenoviruses, Polioviruses, Coxsackie viruses, Phinoviruses, Enteroviruses, Echoviruses, *Myxoviruses, *Cytomegaloviruses, Herpesvirus hominis, Feces, Cell cultures.

Viruses collected from nasal and pharyngeal swabs and fecal specimens were used in a comparison of the relative efficiency of HEK cells and WI-38 cells for isolation of viruses. The HEK cells were more efficient for recovery of adenovirus and poliovirus strains, and coxsackievirus (B group) recovery was limited to HEK. Conversely, WI-38 cells were more efficient for recovery of Herpesvirus hominis and the echovirus types encountered. Recovery of CMV and rhinoviruses was accomplished only in WI-38 cells. Supplemental cell systems were necessary for the recovery of respiratory syncial and, usually, CMV viruses. Mixtures of two viruses in the same specimen were identified much more frequently in HEK cells than in WI-38 cells. (Little-Battelle)

THE DIRECT ENUMERATION OF ESCHERICHIA COLI IN WATER USING MACCONKEY'S AGAR AT 44 C IN PLASTIC POUCHES,
Centraal Instituut voor Voedingsonderzoek TNO, Zeist (Netherlands).
D. A. A. Mossel, and C. L. Vega.
Health Laboratory Science, Vol 10, No 4, p 303-307, October 1973. 2 tab, 36 ref.

Descriptors: *Cultures, *E. coli, *Water analysis, Foods.
Identifiers: *Method validation, *Direct enumeration, Feces, Meats, Culture media, Agars, Counting, Sample preparation, Most probable number, Fecal pollution.

Twenty-five water samples were examined by one of the European MPN standard techniques for E. coli (enrichment in brilliant green bile lactose broth and isolation on MacConkey agar at 44 C followed by MacKenzie, et al modification of Eijkman's elevated temperature test), and by direct enumeration of E. coli in MacConkey agar, using plastic pounches incubated in a water bath at 44 C. Sime forty strains of E. coli freshly isolated from water, stools, fresh meats and poultry were examined by conventional plating in MacConkey's agar at 37 C and in pouches at 44 C. The results obtained in both series of tests substantiated the validity of the suggested direct enumeration procedure, which combines simplicity, reliability and rapidity. (Little-Battelle)
W74-04768

SPECTROPHOTOMETRIC ESTIMATION OF ARSENIC IN NITRIC ACID EXTRACTS OF SOIL AND SOIL ADDITIVES,
National Vegetable Research Station, Wellsbourne (England).
G. F. Collier.
Journal of the Science of Food and Agriculture, Vol 24, No 9, p 1115-1117, September 1973. 1 tab, 4 ref.

Descriptors: *Spectrophotometry, *Soil analysis, Separation techniques, Nitrites, Soils, Trace elements, Arsenic compounds, Pollutant identification.
Identifiers: *Arsenic, Detection limits, Chemical interference, Recovery, Sample preparation, Accuracy.

The spectrophotometric determination of arsenic in solutions containing nitric acid necessitates the removal of nitrate ions without loss of arsenic. A convenient and effective method for its removal was achieved by treatment with formic acid. The recoveries of arsenic over the working range, 0.4 to 4.0 ppm gave a standard error of 0.039 and 0.052 ppm, respectively. The recoveries obtained by the proposed method of nitrate removal compare favorably with those of the more tedious evapora-

tion procedures where recoveries of 87 percent are reported. It is also a simple and rapid method and permits the detection of arsenic over the normal working range with the minimum of error. (Mortland-Battelle)
W74-04769

ANALYSIS OF TRACE ELEMENTS, PHOSPHORUS AND SULPHUR, IN THE LIPID AND THE NON-LIPID PHASE OF HALIBUT (HIPPOGLOSSUS HIPPOGLOSSUS) AND TUNNY (THUNNUS THYNNUS),
Central Inst. for Industrial Research, Oslo (Norway).
G. Lunde.
Journal of the Science of Food and Agriculture, Vol 24, No 9, p 1029-1038, September 1973. 2 fig, 4 tab, 14 ref.

Descriptors: *Phosphorus, *Sulfur, Fish, *Lipids, Cadmium, Lead, Copper, Zinc, Iron, Mercury, Separation techniques, Neutron activation analysis, X-ray fluorescence, Bromine, *Trace elements, Food chains.
Identifiers: Selenium, Arsenic, *Halibut, *Tunny, Sample preparation, Atomic absorption spectrophotometry.

To study the effect which some natural conditions have upon the level of trace elements, halibut was chosen as representative for a relatively stationary species of fish and old individuals of tunny were selected as examples of non-stationary fish. Samples were homogenized in a blender and extracted with hexane. The insoluble phase (meal) and the aqueous phase were dried, weighed, ashed, the ash dissolved in HCl, and diluted with water. The determination of zinc, iron, selenium, copper, lead, and cadmium in the meal and in the dehydrated aqueous phase was carried out using atomic absorption spectrophotometery and X-ray fluorescence techniques for zinc, cadmium, lead, copper, arsenic, and iron and neutron activation for the analysis of selenium. Mercury was determined together with the selenium in the meal by non-destructive activation analysis. In the aqueous phase the mercury was analyzed in some samples by flameless atomic absorption spectrophotometry. The results show that the tunny which cover a great area and occupy positions near the top of the marine food chain show large variations in the content of the different trace elements analyzed. The halibut samples taken from the various localities did not show such a great difference in the content of trace elements analyzed for. Nor could any particular difference between young and old individuals be observed. The content of the heavy metals lead, copper, zinc and cadmium seems on average to be within the same range as formerly reported. The values for iron found in halibut, are, however, remarkable low. (Morland-Battelle)
W74-04770

A BACTERIOLOGICAL PRESSURE-RETAINING DEEP-SEA SAMPLER AND CULTURE VESSEL,
Woods Hole Oceanographic Institution, Mass.
H. W. Jannasch, C. O. Wirsen, and C. L. Winget.
Deep-Sea Research, Vol 20, No 7, p 661-664, July 1973. 2 fig, 7 ref.

Descriptors: *Marine bacteria, *Sampling, Cultures, Pressure, Incubation, Mixing, Instrumentation, Deep water, Design criteria, Oceans, Mechanical equipment.
Identifiers: *Culturing vessels, *Deep sea sampler.

In order to overcome the decompression problem in bacteriological deep-sea sampling, an instrument was constructed that can be operated both as a sampler and pressurized culture vessel. The 1-liter sample does not undergo a change of pressure during filling at the site of sampling nor during retrieval to the surface and prolonged periods of incubation in the laboratory. Sub-samples of 13 ml may be withdrawn and added without affecting the pressure within the vessel. Means for easy pressure adjustment as well as internal mixing are provided. The sampler was built for operation at pressures of up to 200 atm with a 2 1/2-fold safety margin. It has been successfully tested under internal and external maximum pressure and was used for laboratory experiments. Another instrument to be used for sampling at depths of up to 6000 m is under construction. The sampler consists of two stacked cylinders, each containing a floating piston. It includes three chambers, one of which is divided in two sections by a fixed block containing the adjustable orifice and port for prefilling with sterile distilled water. The sample chamber is lined with non-porous Teflon. The upper end-cap contains the sample inlet valve, the bottom end-cap and a valve for charging the third chamber with air. Six tie-rods clamp the components into a pressure-tight assembly. (Mortland-Battelle)

APPARATUS FOR RECORDING AVOIDANCE MOVEMENTS OF FISH,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
E. Scherer, and S. Nowak.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1594-1596, October 1973. 3 fig, 3 ref.

Descriptors: *Toxicity, *Bioassay, *Laboratory equipment, *Fish behavior, Movement, Design criteria, Costs, Instrumentation, Water pollution effects, Electronic equipment, Pollutants.
Identifiers: Recorders.

An apparatus for continuously recording movements of fish exposed to chemical substances in a tank consists of an open sight viewer connected to the shaft of a power-supplied potentiometer and mounted so that an observer can track a specimen in the test chamber. The tank is designed with inlets at each end and an outlet in the middle so that a test solution can be precisely added to one end and untreated water at the other end of the tank. The tank is observed through a one-way mirror to reduce visual disturbance of the fish. Varying the position of the viewer changes the output voltage from the potentiometer to a strip chart recorder. The viewer also actuates a voltage sensitive switch which activates a timer when the fish enters one half of the tank and gives a cumulative time of exposure to the conditions in that section. A second timer records overall elapsed test time. Sample recordings show the avoidance response of goldfish when exposed to HgCl2. Total cost of materials to build the system is 1350 dollars, and construction time is about 50 manhours. (Little-Battelle)
W74-04776

USE OF A SILVER-SULFIDE ELECTRODE FOR STANDARDIZING AQUEOUS SULFIDE SOLUTION IN DETERMINING SULFIDE IN WATER,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1589-1591, October 1973. 2 fig, 7 ref.

Descriptors: *Sulfides, *Aqueous solutions, *Water analysis, *Pollutant identification, Methodology, Volumetric analysis, Pollutants, Chemical analysis.
Identifiers: *Silver/sulfide electrodes, Standardization, Potentiometric titration, Endpoints, Iodometric standardization, Ion selective electrodes.

A simplified method is described for standardizing aqueous sulfide solution in determining sulfide in water. A silver-sulfide electrode is used to detect the endpoint in titration of standard solution of sodium sulfide by silver nitrate. The method makes it possible to perform potentiometric titration within 60 sec by adding the titrant until the potential reading is between -150 and 0 mv, without plotting the data on a graph. The concentrations of sulfide solutions determined by this method were within plus or minus 0.24 mg S (SD), or 3 percent, of the values obtained by the conventional iodometric standardization. (Holoman-Battelle)
W74-04777

MERCURY UPTAKE AND ION DISTRIBUTION IN GILLS OF RAINBOW TROUT (SALMO GAIRDNERI): TISSUE SCANS WITH AN ELECTRON MICROPROBE,
Michigan State Univ., East Lansing. Dept. of Physiology.
K. R. Olson, and P. O. Fromm.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1575-1577, October 1973. 4 fig, 7 ref.

Descriptors: *Rainbow trout, *Mercury, *Distribution patterns, Bioassay, Path of pollutants, Heavy metals, Ions, Absorption, Electron microscopy, Freeze drying.
Identifiers: *Gills, *Methylmercury, *Bioaccumulation, Sample preparation, Biological samples, Transport.

Rainbow trout were exposed to 0.25 ppm HgCl2 and 0.05 ppm methylmercury for 23 hr and the gills removed and examined by electron microprobe for the purpose of identifying the pathway of Hg uptake. Gills were prepared by quick freezing, cutting into 4-10-micron sections, mounting on quartz slides or carbon discs, and freeze drying. Mercury was found in gills of rainbow trout which had been exposed to inorganic mercury but not in those exposed to methylmercury. No specific site for mercury uptake was identified and it is suggested that inorganic mercury enters the gill across the general lamellar surface. High concentrations were found associated with the gill cartilage. Since little ion diffusion occurs during tissue preparation, localization and /or identification of tissues can be accomplished by scans for various elements: sodium (Na), potassium (K), Chlorine (Cl), and sulfur (S). The technique is not suitable for identification of highly volatile compounds such as methylmercury due to the necessity of subjecting tissues to high vacuum conditions, however, electron probe analyses should be useful in studies of active ion transport systems in gill tissue and in investigations of the effects of heavy metal pollutants on fishes. (Little-Battelle)

Identifiers: Errors, Dissolved inorganic carbon.

In the course of studying phytoplankton response to low carbon levels and fertilization with phosphate and nitrate in lake 227 a eutrophic soft-water lake in the Canadian Shield, several paradoxes were observed. Although standing crop increased after fertilization, primary productivity as measured by C-14 uptake at midday remained the same as for unfertilized lakes. Furthermore, although carbon was shown not to limit phytoplankton standing crop, certain observations pointed to carbon limitation of photosynthesis. To attempt to resolve these inconsistencies, a new method was employed based on the diurnal variation of dissolved inorganic carbon (DIC), community respiration, and invasion of CO2 as measured by gas chromatography. Errors were found to result from diurnal variations in the degree of carbon limitation of phytoplankton and from invasion of CO2 from the atmosphere and hypolimnion. Production by phytoplankton in lakes fertilized with nitrogen and phosphorus was found to be several times higher than in natural lakes of the area. Net production during summer stratification was found to equal invasion of CO2 from the atmosphere. The new technique should have application in other eutrophic low carbon lakes, where C-14 tracer techniques are encumbered by serious technical complications. (Little-Battelle)

A SYRINGE GAS-STRIPPING PROCEDURE FOR GAS-CHROMATOGRAPHIC DETERMINATION OF DISSOLVED INORGANIC AND ORGANIC CARBON IN FRESH WATER AND CARBONATES IN SEDIMENTS,
Fisheries Research Board of Canada, Vol 30, No 10, p 1441-1445, October 1973. 2 fig, 1 tab, 9 ref.

Descriptors: *Gas chromatography, Freshwater, Sediments, *Water analysis, Soil analysis, Carbon, Carbamates, Methodology, Chemical analysis, Aquatic soils, Calcite, Dolomite, Nutrients, Nitrilotriacetic acid, Ureas, Calcium carbonate, Canada.
Identifiers: *Dissolved inorganic carbon, Dissolved organic carbon, Syringe gas-stripping method, Sample preparation, Sensitivity, Chemical recovery, Precision, Organic carbon, Lake Winnipeg, Oxalic acid, Tartaric acid, Dextran, Sucrose, Glucose.

A simple, rapid method is described for determining dissolved inorganic carbon in water. A 20-cu cm sample of water is drawn into a 50-cu cm polypropylene syringe and acidified by injection of 1-cu cm of dilute sulphuric acid. Twenty-nine cubic centimeters of helium at atmospheric pressure is injected into the syringe followed by 10 sec of manual agitation to partition CO2 between gas and liquid phase. The gas phase containing 60 percent of CO2 from the sample is then analyzed by gas chromatography. This method has been used to determine dissolved inorganic and organic carbon in Canadian Shield waters and to determine total carbonates in sediments. (Holoman-Battelle)

IDENTIFICATION OF BACTERIA BY COMPUTER: THEORY AND PROGRAMMING,
Central Public Health Lab., London (England). National Collection of Type Cultures.
W. R. Willcox, S. P. Lapage, S. Bascomb, and M. A. Curtis.
Journal of General Microbiology, Vol 77, No 2, p 317-330, August 1973. 1 tab, 28 ref.

Descriptors: *Aerobic bacteria, *Computer programs, *Pollutant identification, Statistical methods, Probability, Laboratory tests, Numerical analysis, Enteric bacteria, Pathogenic bacteria, Methodology.
Identifiers: Bayesian probability.

The methods incorporated in the computer program used in a trial of computer-aided identification of bacteria are described. The identification method is based on Bayes's theorem and allows for dependent tests and missing data in the probability matrix. It was found useful in developing the method to take account of the occurence of errors in bacteriological testing. The method suggests a definite identification only if the Bayesian probability of one of the taxa exceeds a threshold level; if not, a separate procedure selects the best tests to continue the identification. (Mortland-Battelle)

PROBLEM OF ISOLATING SALMONELLA FROM SURFACE WATERS EXEMPLIFIED BY LONG-TERM STUDIES IN THE BERLIN AREA, CAPITAL OF THE GERMAN DEMOCRATIC REPUBLIC, (IN GERMAN),
W. Krueger.
Z Gesamte Hyg Grenzgeb. 18(8): p 590-593. 1972.
Identifiers: *Germany(Berlin area), Human diseases, *Salmonella isolation, Sever discharges, Surface waters, *Public health.

Reliable bacteriological diagnosis is a condition of true epidemiological interpretation of instances of Salmonella isolation from surface waters. Surface water samples (184) taken from various biotopes in the area of Berlin yielded 98 strains of Salmonella of 18 serotypes. The isolation of 10 rare types in a water clearing installation and previous tests indicated that the Salmonella spectrum of surface waters with sewer discharges is an exact reflection of the epidemiological situation among the population and in animal products. Surface waters without discharges from sewers were Salmonella free.--Copyright 1973, Biological Abstracts, Inc.

5B. Sources Of Pollution

BASELINE QUALITY DATA FOR KALIHI STREAM,
Hawaii Univ., Honolulu. Water Resources Research Center.
G. K. Matsushita, and R. H. F. Young.
Available from National Technical Information Service as PB-227 929 $6.50 in paper copy, $1.45 in microfiche. Technical Report No 71, June 1973. 61 p, 40 fig, 11 tab, 35 ref. OWRR A-027-HI(2). 14-31-0001-3811.

Descriptors: *Water quality, Water samples, Density, Drainage, Sampling, Weather, Pesticides, *Hawaii, *Baseline studies, *Land use, *Water quality standards, *Path of pollutants, Coliforms, Domestic wastes, Nutrients.
Identifiers: *Kalihi stream(H.I.).

The purpose was to determine the changes in Kalihi Stream water quality related to variations in land use patterns and to establish some baseline data for assessing the Hawaii State Water Quality Standards for surface waters. Effects on water quality were determined by collecting and analyzing water samples from four sites located along the course of Kalihi Stream between October 1971 to August 1972. The sites were selected within different land use areas along the stream to account for any variation in contribution from undeveloped and developed lands. The stream water quality data for wet and dry weather flows were found to compare favorably with that of other Hawaiian investigators and were in the same order of magnitude as those in the U.S. and other countries. Pollution loads were also calculated on a lbs/acre/day basis and these results compared favorably with results obtained by other U.S. and Hawaiian investigators. The parameter concentrations and pollutional loads were found to increase in a downstream direction as incremental and individual subbasin drainage areas increased in development, land use activity, population density and housing density. Fecal and total coliform densities exceeded Class 2 Standards during dry and wet weather conditions. The nutrient standards for Class A waters were also exceeded during dry and wet weather. There was no significant pesticide contribution to pollution of Kalihi Stream as well results were in the low ppt range.

MIXING PROCESSES,
R. L. Wiegel.
In: Oceanographical Engineering, Chapter 16, p 424-441, 1964. 20 fig, 44 ref. Prentise Hall, New York, NY, Price: $24.75.

Descriptors: Coasts, *Sewage disposal, *Mixing, *Outfall sewers, *Waves(Water), *Currents(Water), *Effluents.
Identifiers: Ocean outfall sewers, Eddy diffusion, Breaking waves, Turbulent flow, Turbulent jets, Wind waves.

Mixing processes are of prime importance to the engineer and to the oceanographer. The transfer of heat down through the surface layers of the ocean is largely due to mixing by eddy diffusion and by large-scale stirring induced by the breaking of waves in a sea. The entrainment of water by currents is due to the mixing of the currents with the boundary waters. The disposal of sewage by coastal towns is usually done by the mixing of the effluent from ocean outfall sewers with the sea water. Some of these mixing processes are described. Explanations are given on the following: mixing of turbulent jets, jet discharging into denser fluid, jet discharging horizontally into denser fluid, jet discharging into fluid with a stable density gradient, horizontal jet as a free surface, eddy diffusion, mixing by wind waves, and mixing by currents. A STUDY OF DIFFUSION IN AN ESTUARY,
Navy Hydrographic Office, Washington, D.C.
W. E. Maloney, and C. H. Cline.
In: Proceedings of Seventh Conference on Coastal Engineering, The Hague, Netherlands, August 1960, ASCE, Published by Council, the Engineering Foundation, Vol 2, Chap 29, 536-547, 1961. 10 fig, 1 tab, 5 ref.

Descriptors: *Estuaries, *Pollutants, *Diffusion, *Dispersion, Tidal effects, River flow, Coasts, *Virginia.
Identifiers: Hampton Roads(VA), Flushing, James River(VA), Dilution.

A diffusion-advection method based on a coefficient of eddy diffusivity is used to determine the reduction in concentration and removal of contaminants from estuaries. The discussions are concerned with that portion of a contaminant that goes into solution and partakes of the motion of the waters. A set of empirical dilution factors was computed. The total amount of contaminant released multiplied by the appropriate dilution factor gives the concentration at that time. Two dilution factors are given so that computations may be made either in terms of cubic centimeters or cubic feet. The rapid leveling off of the dilution factors after about 1 tidal cycle assumes that none of the contaminant is advected out of the area. (Sinha-OEIS)
W74-04333

CURRENTS AT HARBOR BEACH, MICHIGAN,
United States Lake Survey, Detroit, Mich.
J. H. Saylor.
Available from NTIS as AD-676 838, for $6.00 paper copy, $1.45 microfiche. Research Report No. 1-3, August 1968. 27 p, 11 fig, 7 ref.

Descriptors: Lakes, *Lake Huron, *Harbors, *Currents(Water), *Water circulation, Winds, *Wind tides, *Thermal pollution, Industrial wastes, Waste disposal, Water pollution, Heated water, Power plants, *Michigan, Path of pollutants.
Identifiers: Flushing, Nearshore, Wind driven currents, Hindcasting.

Currents at Harbor Beach, Michigan were measured using drogue and dye techniques. The measurements showed two patterns of harbor currents depending on the direction of current flow along the shore of Lake Huron. Strong, northerly wind caused southward-flowing currents along the shore of the lake, southward currents along the shore side of the harbor, and good harbor flushing. Wind from directions other than northerly was associated with northward-flowing currents along the shore of the lake and sluggish, northward currents through the harbor. The pattern of northward harbor currents occurred about 75% of the time. It was concluded that the prevailing nearshore currents at this location on Lake Huron are northward. The current patterns show that a power plant recently constructed north of the U.S. Coast Guard Boathouse can expect to recirculate a portion of its own discharge and a portion of the effluent from the Hercules Powder Company (located on the north side on the Company's dock) for the same percentage of time. Turbulence of the power plant discharge will accelerate the vertical mixing of this effluent to all depths. Currents in the vicinity of the new intake and discharge channel will alter patterns locally, but it is not felt that they will change the overall harbor circulation which is driven principally by the nearshore currents in Lake Huron. (Sinha-OEIS)

ENVIRONMENTAL MONITORING AND DISPOSAL OF RADIOACTIVE WASTES FROM U.S. NAVAL NUCLEAR-POWERED SHIPS AND THEIR SUPPORT FACILITIES, 1972,
Department of the Navy, Washington, D.C.
M. E. Miles, and G. L. Sjoblom.
Available from the Supt. of Documents, U.S. Government Printing Office, Washington, D.C. $1.00 per copy. Radiation Data and Reports, Vol 14, No 9, p 517-525, Sept. 1973. 5 tab, 24 ref.

Descriptors: *Nuclear reactors, *Ships, *Radioactive waste disposal, *Harbors, Oceans, Seas, Water pollution, Water pollution sources, Monitoring, Measurement, Assay, Sampling, Toxicity, Public health, Tritium, Cobalt, *United States.

The environmental effect of disposal of radioactive wastes originating from U.S. Naval nuclear propulsion plants and their support facilities is assessed. The total radioactivity discharged to all ports and harbors from the more than 100 nuclear-powered ships and supporting tenders, bases and shipyards was less than 0.002 curie in 1972. Procedures used by the Navy to control releases of radioactivity from U.S. Naval nuclear-powered ships and their support facilities are effective in protecting the environment and the health and safety of the general public. (Houser-ORNL)
W74-04441

A HISTORY AND PRELIMINARY INVENTORY REPORT ON THE KENTUCKY RADIOACTIVE WASTE DISPOSAL SITE,
Kentucky Dept. of Health, Frankfort. Radiological Health Program.
D. T. Clark.
Available from Supt. of Doc., U.S. Print. Off., Washington, D.C., $1.00 per copy. Radiation Data and Reports, Vol 14, No 10, p 573-585, Oct. 1973. 6 fig, 2 tab, 9 append.

Descriptors: *Waste disposal, *Radioactive waste disposal, *Solid wastes, *Liquids, *Kentucky, Nuclear wastes, Assay, Radioisotopes, History, Census, Strontium, Cesium, Tritium, Cobalt, Radium radioisotopes, Permits, Regulation, Data collections, Water pollution, Soil contamination, Public health, Waste storage.
Identifiers: *Waste burial.

The Kentucky radioactive waste disposal site, operated by the Nuclear Engineering Company, Inc., has been in operation since March 1963. As of January 1, 1972, approximately 0.71 million cubic meters of waste, containing 1,153,333 curies of byproduct material, 208,903 grams of special nuclear material, and 39,493 kilograms of source material, have been disposed of at this facility. Due to the relatively long period of operation and the large quantities of radioactive material involved, a detailed inventory of two of the largest pits at the site was made, based on available disposal records. A brief history of this facility and a summary of the inventory results are presented. Detailed data are given for plutonium, cesium, strontium, cobalt, radium, and tritium. (Houser-ORNL)
W74-04442

ECODISTRIBUTION OF PLUTONIUM IN LIQUID WASTE DISPOSAL AREAS AT LOS ALAMOS,
Los Alamos Scientific Lab., N. Mex.
T. E. Hakonson, L. J. Johnson, and W. H. Purtymun.
Available from NTIS, Springfield, Va., as Report No. LA-UR-73-1001. $4.00 per copy, $1.45 microfiche. Report No. LA-UR-73-1001, 1973. 23 p, 3 fig, 3 tab, 9 ref.

Descriptors: *Waste disposal, *Liquid, *Plutonium, *New Mexico, *Ecology, *Ecosystems, *Ecological distribution, Geology, Canyons, Surveys, Assay, Radioactivity, Sediments, Water, Biota.

The nuclear programs at Los Alamos have generated quantities of solid and liquid radioactive wastes. Although the liquid wastes are treated to remove impurities, a small but measurable fraction of the radioactive constituents remain in the effluent. Currently, these effluents are released into two canyons where they eventually disappear into the alluvium. In the past, an additional canyon was used as a liquid waste disposal area, but has not been used since 1964. A survey was initiated in each of these canyons to determine the concentrations of effluent-associated radionuclides in the alluvial sediments, water and some of the native biota. Preliminary findings are summarized on the ecodistribution of Pu-238 and Pu-239 in Mortandad Canyon, an area which has been used for liquid effluent disposal. (Houser-ORNL)

ONE-DIMENSIONAL MODEL OF THE MOVEMENT OF TRACE RADIOACTIVE SOLUTE THROUGH SOIL COLUMNS: THE PERCOL MODEL,
Battelle-Pacific Northwest Labs., Richland, Wash.
R. C. Routson, and R. J. Serne.
Available from NTIS, Springfield, Va., as Report No. BNWL-1718. $5.45 per copy, $1.45 microfiche. Report No. BNWL-1718, 1972. 60 p, 25 fig, 16 tab, 7 ref.

Descriptors: Model studies, *Radioactivity, *Soil chemical properties, *Soil contamination, Soil physical properties, Soil properties, Soil water movement, *Mathematical models, *Path of pollutants.
Identifiers: *Radionuclide movement(Soils).

A one-dimensional mathematical model, PERCOL, has been developed to predict the movement of radionuclides through porous media as a function of measureable chemical parameters of the media. Laboratory column studies were conducted to verify the model. System parameters considered include soil type, radionuclide type, waste composition, flow rate, column length, and soil saturation. The agreement between measured radionuclide movement and that predicted by the model is considered good. (Houser-ORNL)

ANNUAL CONSUMPTION OF CESIUM-137 AND COBALT-60 LABELED PINE SEEDS BY SMALL MAMMALS IN AN OAK-HICKORY FOREST,
Oak Ridge National Lab., Tenn.
J. B. Mathies, P. B. Dunaway, G. Schneider, and S. I. Auerbach.
Available from NTIS, Springfield, Va., as Rept No. ORNL-TM-3912. $7.60 per copy, $1.45 microfiche. Report No. ORNL-TM-3912, Dec

1972. 234 p, 33 fig, 62 tab, 166 ref, 3 append. (Ph.D. Thesis, Michigan State University, Lansing).

Descriptors: Mammals, *Rodents, *Absorption, Radioactivity, *Cesium, *Cobalt, *Radioisotopes, Diets, Digestion, Toxicity, Assay, *Forests, Trees, Hickory trees, Oak trees, Seeds, Soils, Vegetation, Seasonal, Ecology, Research and Development, *Tennessee.

Annual and seasonal consumption of eastern white pine seeds was determined radioisotopically in both laboratory and free-ranging populations of small forest mammals within a 2-ha, oak-hickory forest in eastern Tennessee. White-footed mice were chronically-fed Cs-137 and Co-60 labeled pine seeds in the laboratory, and the resultant uptake, equilibrium, and excretion patterns in mice were used to infer food consumption rates. Seed-ingestion rates, of from 2 to 100 seeds per day, were highly correlated with equilibrium levels of Cs-137. Lowering the ambient temperature resulted in lower equilibria, through a range of 21.1C to 4.4C; equilibria in male mice was lower than in females. Free-ranging mice rapidly acquired radioactive body burdens of both isotopes. (Houser-ORNL)
W74-04450

ENVIRONMENTAL SURVEILLANCE FOR FUEL FABRICATION PLANTS,
Battelle Pacific Northwest Labs., Richland, Wash.
J. P. Corley, D. A. Waite, J. W. Johnston, and L. C. Schwendiman.
Available from NTIS, Springfield, Va., as Rept. No. BNWL-1723. $5.45 per copy, $1.45 microfiche. Report No. BNWL-1723, April 1973. 71 p, 1 fig, 2 tab, 70 ref, 4 append.

Descriptors: Surveys, *Monitoring, *Radioactivity, Assay, Air pollution, Water pollution, Soil contamination, *Nuclear powerplants, Nuclear wastes, Fuels, Environment, Sampling, Standards, Regulation, Path of pollutants, Sediments, Vegetation, Biota, Aquatic animals, Fish, Public health.
Identifiers: *Fuel reprocessing, *Surveillance program.

Source material is provided which may be used for: (a) preparation of a regulatory guide concerning environmental surveillance programs for fuel fabrication facilities; (b) evaluation of those portions of environmental statements for fuel fabrication facilities pertaining to proposed environmental surveillance programs. Included is an environmental surveillance program sufficiently general to cover plants fabricating uranium oxide or mixed uranium and plutonium fuels. Program content is not specific to a particular plant. The proposed program provides for surveillance of media believed either to be significant in terms of dose to man or to be potential centers for long-term accumulation of contaminants. To avoid excessive duplication which would result from complete treatments of uranium and mixed oxide plants separately, discussion of the proposed program is presented mainly in terms of plutonium. The program is, however, equally applicable to both uranium and mixed oxide plants, with recognized points of divergence pointed out and discussed. (Houser-ORNL)
W74-04451

RADIOLOGICAL STATUS OF THE GROUNDWATER BENEATH THE HANFORD PROJECT, JULY-DECEMBER 1972,
Battelle Pacific Northwest Labs., Richland, Wash.
K. L. Kipp, Jr.
Available from NTIS, Springfield, Va., as Rept. No. BNWL-1752. $4.00 per copy, $1.45 microfiche. Report No. BNWL-1752, Aug. 1973. 34p, 3 fig, 9 tab, 4 ref.

Descriptors: *Surveys, Radioactivity, Groundwater, *Radioisotopes, *Tritium, *Nitrates, Measurement, Assay, Regulation, Cobalt radioisotopes, Columbia River, Path of pollutants, Public health, *Washington.
Identifiers: *Ruthenium, Hanford site, Gross beta.

An evaluation of 106-Ru and 3-H concentrations measured near the surface of the unconfined groundwater during the last half of 1972 showed that zones of detectable contamination extended in an easterly to south-easterly direction, as has been observed in the past. Measurable tritium and nitrate ion concentrations were found along the Columbia River. A low groundwater mound showing uranium and nitrate ion continued to be observed in some areas. The few locations were identified for which average groundwater concentrations exceeded the Concentration Guide (CG) of 10 pCi/ml for 106-Ru. Significant concentrations of 106-Ru (over 10% of CG) were found in some areas. Gross beta activity in the groundwater beneath some areas was detectable. (Houser-ORNL)
W74-04452

STRONTIUM-90 AND CESIUM-137 LEVELS IN SOILS OF VARIOUS TYPES AT NIIGATA PREFECTURE, JAPAN,
Niigata Univ. (Japan). Faculty of Agriculture.
K. Kawase, and E. Yokoyama.
Journal of Radiation Research, Vol 14, No 1, p 40-48, March 1973. 2 tab, 17 ref.

Descriptors: *Nuclear explosions, *Radioactivity, *Fallout, *Soil contamination, *Strontium, *Cesium, Measurement, Uptake, Vegetation, Grassland, Forests, Lagoons, Rice, Aquatic soils, Monitoring, Soil leaching, Ion transport, Movement, Depth.
Identifiers: *Japan.

Sr-90 and Cs-137 contents of soils, mostly from radioactive fallouts of past nuclear explosions, were estimated at 15 locations in Niigata Prefecture. Fifteen locations include paddy fields, meadow, grass fields, forest and dried lagoon. Sr-90 contents of the soils, except forest and dried lagoon, ranged from 81 to 315 mCi/km sq. and Cs-137 ranged from 234 to 451 mCi/km sq. These results indicate that the soils except forest and lagoon were highly contaminated with Sr-90 and Cs-137 from radioactive fallouts. The high activities of Sr-90 and Cs-137 were noted in rice paddy fields. Sr-90 of 316 mCi/km sq of Muramatsu Town and Cs-137 of 451 mCi/km sq of Gosen City are probably the highest values recorded in Japan. These high values may reflect the high annual rainfall of these areas. Relatively low Sr-90 and Cs-137 levels of forest soils and dried lagoon suggest that Sr-90 in strongly acidic, sandy and low humic soils were washed away rather easily by water and that Cs-137 in very reductive paddy soil and in volcanic ash soil were also easily removed by water. The distribution of Sr-90 and Cs-137 in relation to various depth of soils indicates that the monitoring of two nuclides in soils should be carried out from the soil sample dug to 50 cm depth. (Houser-ORNL)
W74-04453

TRANS-PACIFIC FALLOUT AND PROTECTIVE COUNTERMEASURES,
Oak Ridge National Lab., Oak Ridge, Tenn.
C. H. Kearny.
Available from NTIS, Springfield, Va., as Report No. ORNL-4900, $4.00 per copy, $1.45 microfiche. Report No. ORNL-4900, Nov. 1973. 25 p, 4 fig, 1 tab, 19 ref.

Descriptors: *Fallout, *Radioactivity, *Meteorology, Movement, *Nuclear explosions, United States, Hazards, Warning systems, Iodine, Milk, Public health, Safety, Air circulation, *Air pollution.
Identifiers: *China.

If a nuclear war in which the United States is not a belligerent is fought in China and if the weapons used produce tropospheric fallout, then the trans-Pacific fallout deposited on the United States may create long-term health hazards that protective counter-measures can do much to lessen. Extrapolations are made from the measured results of lower tropospheric fallout deposited in the United States from four of the first five Chinese tests. It is estimated that if during a war 65 megatons of similar weapons were detonated on or over China so as to produce similar lower tropospheric debris, then in extensive areas of the 50 states much milk would be dangerously contaminated with radioactive iodine. Hazards and expected long-term casualties from eating other fallout-contaminated foods and from exposure to total whole-body gamma doses of 1 to 10 rems from such trans-Pacific fallout in the year following a spasm war are summarized. Also outlined are recommended protective counter-measures and the psychological-political advantages likely to be attained if the President and other high officials were prepared to give all Americans an early, factual account of the approaching trans-Pacific fallout dangers and of the protective countermeasures being taken to minimize casualties and economic losses. (Houser-ORNL)
W74-04454

A RADIOLOGICAL ENVIRONMENTAL SURVEY AT EBR-II,
B. G. Oltman, K. Eckerman, R. Gold, and A. M. Strash.
Report available from NTIS, Springfield, Va., as Report Number ANL-8060, Part II. $10.60 per copy, $1.45 microfiche. In: Report ANL-8060 (Part II), p 278-288, July 1972-June 1973. 4 fig, 3 tab, 6 ref.

Descriptors: *Surveys, Measurement, *On-site data collections, *Idaho, *Radioactivity, Atmospheric pollution, Water pollution, *Soil contamination, Effluent, Nuclear powerplants, Cesium, Lead, Public health, Gamma rays.
Identifiers: Big Lost River(Ida), Plutonium.

Absolute environmental gamma-ray and meson dose rates were determined from measurements made in the vicinity of EBR-II. The detector used for the measurements was a 5-in. diameter sphere of liquid organic scintillator. Fourteen measurements were made at radial distances of up to 5 miles from the EBR-II effluent stack. The average external gamma-ray and meson dose rates determined were 6.0 microrad/hr and 4.5 mircorad/hr, respectively. Soil samples obtained at each of the measurement sites were later analyzed for gamma-ray emitters and for plutonium content. Other than naturally occurring radioactivity, only Cs-137 and Sb-125 seemed to be present in statistically significant amounts. No plutonium deposition pattern can be constructed from the limited number of analyses done. (Houser-ORNL)
W74-04455

ENVIRONMENTAL RADIOACTIVITY,
L. I. Gedeonov.
Issue available from Plenum Pub. Corp., 227W 17th St., New York, N.Y. $15.00 per copy. Soviet Atomic Energy Agency, Vol 33, No 2, Aug. 1972, p 760-765, Feb. 1973. Trans. from Atomnaya Energiya.

Descriptors: Environment, Research and development, Ecology, *Air pollution, Water pollution, *Water pollution sources, Soil contamination, *Radioactivity, *Monitoring, Nuclear powerplants, Nuclear wastes, Mathematical studies, Geochemistry, Geophysics, Radiochemical analysis, Public health.

Studies of radioactive contamination of various media in the biosphere carried out at the Radium Institute over many years have made it possible to develop methods of investigation which are widely applicable at the present time. A large amount of data has been accumulated on the distribution of

radioactive contaminants in space and on the variation of their concentration in time. Certain relationships have been described mathematically; their interpretation was based on geophysical and geochemical factors. One can hope for future discovery and determination of the actual mechanism responsible for the observed relationships. It would then appear to be possible to evaluate the presumed radiation hazard from contamination of the seas and oceans. The capability of observing artificial and natural radioactive tracers now existing in nature should be used as an instrument for studying geophysical and geochemical processes. (Houser-ORNL)
W74-04456

PHOSPHORUS RELATIONSHIPS IN RUNOFF FROM FERTILIZED SOILS,
Agricultural Research Service, Lafayette, Ind.
M. J. M. Romkens, and D. W. Nelson.
Journal of Environmental Quality, Vol 3, No 1, p 10-13, January-March 1974. 4 fig, 2 tab, 14 ref.

Descriptors: *Water pollution sources, *Phosphorus, *Fertilizers, *Phosphates, *Soil water movement, Erosion, Sediments, Path of pollutants.

The effect of fertilizer mixed into soil on the amount of phosphorus in runoff was studied. Runoff samples from artificial rainstorms on fallow plots of Russell sil soil, and P enriched soil-water mixtures (1:50) of Russell sil and other soils were analyzed for water soluble orthosphosphate and extractable, total, and organic P in sediment. The relation of P addition rate to the soluble orthosphosphate or sediment extractable phosphorus level in runoff was approximately linear. The relation of soluble orthophosphate to extractable P in soil-water systems was linear for most soils studied. Soluble orthosphosphate and extractable P in sediment were not related to total P or to organic P in sediment. A procedure is suggested for estimating the soluble orthophosphate concentration in runoff from fertilized wet soil using laboratory analyses. (Knapp-USGS)
W74-04471

NUTRIENTS IN SUBSURFACE AND RUNOFF WATERS OF THE HOLLAND MARSH, ONTARIO,
Ministry of the Environment, Rexdale (Ontario). Water Quality Branch.
K. H. Nicholls, and H. R. MacCrimmon.
Journal of Environmental Quality, Vol 3, No 1, p 31-35, January-March 1974. 3 fig, 2 tab, 18 ref.

Descriptors: *Nutrients, *Path of pollutants, Water pollution sources, *Marshes, Soils, *Canada, *Fertilizers, *Nitrogen, *Phosphorus, Nitrates, Nitrites, Runoff.
Identifiers: Holland Marsh(Ont).

Relative contributions to the river of nutrients (NO3, NO2, and total and soluble reactive phosphorus) and total electrolyte (specific conductance) were determined in surface runoff water pumped from both cultivated and uncultivated plots of muck soil within the Holland Marsh, Ontario. In addition, subsurface water from piezometers installed in both cultivated and uncultivated marsh soil was analyzed throughout the growing season to determine fundamental differences in water chemistry and the extent of leaching of N and P under both cultivated and uncultivated conditions. The time and amount of rainfall are important in determining nitrate-N and to a lesser extent, soluble reactive P concentrations in subsurface water beneath the cultivated plot but not beneath the uncultivated plot. The mean concentration (0.75 mg/liter) of inorganic N in subsurface water under the cultivated plot was about 10 times higher than under uncultivated marsh during the growing season. The combined effects of fertilization, drainage and hence oxidizing and nitrifying conditions yielded 4 to 5 times more P (1.56 kg P/ha) and 40 to 50 times more nitrate-N (4.1 kg N/ha) in runoff water from the cultivated than from the uncultivated plot. From the cultivated plot the nutrients are lost to the river during a 5 to 6 week pumping period during the spring and more than 90% of the total P in runoff is in the soluble reactive form (as opposed to only 45% from the uncultivated marsh) and is, therefore, readily available for algae and aquatic plant growth in the lower Holland River and Cook Bay of Lake Simcoe. (Knapp-USGS)
W74-04478

QUANTITY AND CHEMICAL QUALITY OF LOW FLOW IN THE EAST FORK SAN JACINTO AND WEST FORK SAN JACINTO RIVERS NEAR HOUSTON, TEXAS, JUNE 24, 26, 1969,
Geological Survey, Austin, Tex.
J. C. Fisher, and G. Ramos.
Open-file report, December 1973. 21 p, 3 fig, 6 tab, 5 ref.

Descriptors: *Water quality, *Low flow, *Texas, Streamflow, *Hydrologic data, Data collections, Chlorides, Water chemistry.
Identifiers: *San Jacinto River(Tex).

Low-flow data were collected June 24, 1969, on an 18.0-mile reach extending downstream from the gaging station East Fork San Jacinto River near Cleveland, Texas. On June 24, and 26, low-flow data were collected on a 37.3-mile reach extending downstream on the West Fork San Jacinto River from 0.7 mile below the proposed Lake Conroe dam site. Changes in chemical quality of water in the East Fork San Jacinto were minor. Water discharged into Lake Houston contained 153 mg/liter dissolved solids and 54 mg/liter chloride. Flow in the East Fork San Jacinto River increased from 16.0 cfs to 21.2 cfs in the study reach. Discharge measurements indicate a losing reach in the upper 3.7 miles and a gaining reach in the remaining 14.3 miles. Changes in chemical quality of water in the West Fork San Jacinto were minor. Water discharged into Lake Houston contained 242 mg/liter dissolved solids and 80 mg/liter chloride. Flow in the West Fork San Jacinto increased from 2.03 to 36.5 cfs in the study reach. Discharge measurements indicate three losing and six gaining subreaches. (Knapp-USGS)

RELATIVE SUSCEPTIBILITY OF LAKES TO WATER-QUALITY DEGRADATION IN THE SOUTHERN HOOD CANAL AREA, WASHINGTON,
Geological Survey, Tacoma, Wash.
G. C. Bortleson, and B. L. Foxworthy.
Open-file report, 1973. 11 p, 1 fig, 1 plate, 9 ref.

Descriptors: *Lakes, *Water pollution sources, *Washington, Land use, Septic tanks, Path of pollutants, Water pollution effects, Limnology, *Biodegradation, Chemical degradation.
Identifiers: Hood Canal area(Wash).

Techniques were devised to allow a rapid assessment of conditions pertaining to water quality in the lakes in the southern Hood Canal area of Washington. The main objective of this study was to evaluate lakes in the area as to their relative susceptibility to water-quality degradation from natural and man-related causes. Under natural conditions the lakes were surrounded by conifer forests; most are still bordered by woodlands, some of which are in a period of regrowth after timber harvesting. All the lakes studied that have a surface area greater than 20 acres and about one-half the smaller lakes have surface-water outlets at least during periods of high water. Man has accelerated the natural lake aging principally through increased sedimentation, resulting from logging and construction in the lake's drainage area, and enrichment of the water with nutrient substances, such as compounds of nitrogen and phosphorous. Soil and rock materials in the lake drainage basin are a major control on the chemical character of lake water under natural (undeveloped) conditions. Lake depth is the most significant physical feature affecting the ability of a lake to produce and assimilate nutrients. Because virtually all domestic wastes are dispersed through septic-tank systems, groundwater contaminated with septic-tank effluent has become a principal source of nutrients for lakes with populated shorelands. (Knapp-USGS)

APPLICATION OF THE CONCEPT OF RECTILINEAR VORTICES TO THE MOVEMENT OF OIL SLICKS,
Department of the Environment, Ottawa (Ontario). Marine Sciences Directorate.
T. S. Murty, and M. L. Khandekar.
Manuscript Report Series No 32, 1973. 26 p, 6 fig, 2 tab, 10 ref.

Descriptors: *Oil spills, *Path of pollutants, *Numerical analysis, *Vortices, Mathematical models, Currents(Water), Winds, *Canada.

The concept of rectilinear vortices was applied to study the movement of oil slicks in general, particularly in the Strait of Georgia, British Columbia. The formulation of the problem under this concept led to a set of ordinary first order differential equations which were solved using Hamming's modified predictor-correction method. Although numerical models alone cannot predict the detailed movement of oil slicks, at least they can be used to assess some gross features of the motion. The concept of rectilinear vortices is useful in computing the horizontal trajectories of individual slicks. If the current is small, then the mutual interactions of the slicks are very important in determining the trajectories. (Knapp-USGS)

A PROPOSAL FOR THE INVESTIGATION OF POSSIBLE GROUND-WATER CONTAMINATION IN THE BANGOR AREA, KITSAP COUNTY, WASHINGTON,
Geological Survey, Tacoma, Wash.
N. P. Dion.
Open-file report, 1974. 24 p, 1 fig, 3 tab, 10 ref.

Descriptors: *Water pollution sources, *Path of pollutants, *Groundwater movement, *Explosives, Malenclaves, Pit recharge, Waste water disposal, Hydrogeology.
Identifiers: *TNT, *RDX(Cyclonite).

From 1966 to 1970 as a result of steam cleaning of explosive projectiles, explosive wastes were disposed through groundwater recharge. The Navy estimates that between 1966 and 1970 about 50,000 pounds of the explosives TNT (trinitrotoluene) and RDX (cyclonite) were routed to a shallow unlined pit in the ground. Because the disposal pit is in a recharge area of an aquifer used for domestic water supplies, and explosives residues in water may be poisonous, the Navy became concerned with the environmental consequences of the disposal practice. The Geological Survey's proposal for the investigation is described. In Phase I, the initial step covered by this report, the Geological Survey (1) drafts a statement of the problem, (2) defines the scope of the entire study (including Phases II and III), (3) specifies the expected study output, and (4) provides an estimate of the time and costs involved. (Knapp-USGS)

ENVIRONMENTAL CHEMISTRY: AIR AND WATER POLLUTION,
Weber State Coll., Ogden, Utah. Dept. of Chemistry.
H. S. Stoker, and S. L. Seager.
Scott, Foresman and Co., Glenview, Illinois (and London, England). 1972. 186 p.

Descriptors: *Engineering education, *Water pollution, *Air pollution, *Waste water treatment, Water pollution sources, Pollutant identification, Pollution abatement, Mercury, Detergents, Pesticides, Oil spills, Temperature, Meteorology, Thermocline.

This introductory text on the chemistry of water and air pollutants comprises 14 chapters, each with further reading references. They are devoted to the general aspects of pollution (sources, types, and measurement); specific pollutants (such as mercury, detergents, pesticides, oil spills, etc.); temperature inversions (greenhouse effect); and waste water treatment. CHARACTERISTICS OF PULP AND PAPER MILL WASTES AND ISI STANDARDS,
Central Public Health Engineering Research Inst., Nagpur (India).
P. V. R. Subrahmanyam, R. C. Parekh, and G. J. Mohanrao.
IPPTA (Journal of the Indian Pulp and Paper Technical Association), Vol 9, No 1, p 31-39, January-March 1972. 10 tab, 17 ref.

Descriptors: *Pulp and paper industry, *Water pollution sources, Discharge(Water), *Pulp wastes, Effluents, Biochemical oxygen demand, Suspended solids, Water consumption(Except consumptive use), *Mercury, Pollutants, Monitoring, *Water quality standards.
Identifiers: *India.

The growth of the Indian pulp, paper, strawboard, and newsprint industry during the past two decades was accompanied by increased volumes of discharged effluents. Depending on water conservation measures practiced by various mills, effluent discharges may vary considerably. In a well operated integrated pulp and paper mill, they may amount to 227 to 272 cu m per ton of paper made and contain 34.5 kg of BOD and 87.7 kg of suspended solids. Effluents from straw pulp and board mills contain ca. 79.5 kg BOD and 224 kg suspended solids per ton of product. Newsprint mill discharges average 50.3 kg BOD and 83.3 kg solids per ton. Assuming an average discharge of 50,000 gal per ton of product for all kinds of paper, the resulting daily discharge of ca. 87 million gal would be equivalent to the sewage output of a population of 3 million people. Pollution tolerance limits for several industrial effluents are tabulated. The most important, because most toxic, pollutant to be monitored in mill effluents is mercury. (Wise-IPC)

SOME NEGLECTED SOURCES OF WATER POLLUTION (NEDOSTATOCHNO UCHITYVAYEMYYE ISTOCHNIKI ZAGRYAZNENIYA PRIRODNYKH VOD),
A. I. L'vovich.
Vodnyye Resursy, No 3, p 125-130, 1973. 3 tab, 10 ref.

Descriptors: *Water pollution sources, Water pollution, Waste water(Pollution), *Farm wastes, *Pesticide residues, *Fertilizers, *Industrial wastes, *Mine water, Sediments.
Identifiers: *USSR.

Water pollution sources generally disregarded, or inadequately treated in the literature on water pollution control, are examined. These sources include: (1) conditionally clean waters of industrial enterprises; (2) mine waters; (3) surface runoff from populated and industrialized areas and from croplands treated with pesticides and mineral and organic fertilizers; (4) farm wastes; and (5) sediments carried off from eroded lands. Rational and efficient use of water resources and their protection from contamination can be realized only through broad implementation of water conservation measures actively supported by water users themselves. EFFECTS OF BACKPUMPING FROM SOUTH NEW RIVER CANAL AT PUMP STATION S-9 ON QUALITY OF WATER IN WATER-CONSERVATION AREA 3, BROWARD COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. J. Freiberger.
Open-file report 73026, 1973. 64 p, 23 fig, 3 tab, 6 ref.

Descriptors: *Water quality, *Canals, *Florida, *Dissolved oxygen, Water conservation, Water management(Applied), Water pollution sources, Path of pollutants, Water quality control, Hydrologic data, Pumping, Water levels, Flow control, Flood control, Water analysis, Chemical analysis, Biochemistry, Trace elements.
Identifiers: Broward County(Fla), *Backpumping, *Ammonia nitrogen.

The quality of water in Water-Conservation Area 3 (Broward County, Florida) is affected by backpumping from the South New River Canal at pump station S-9, as indicated by marked decreases in dissolved oxygen and increases in ammonia nitrogen in the canals of the conservation area. Decreases in dissolved oxygen immediately above S-9 of as much as 5.8 mg/liter were recorded after backpumping and effects in the canals of the conservation area were detected as far as 3 miles from S-9. Increases in ammonia immediately above S-9 of as much as 01.26 mg/liter were recorded after backpumping. The low dissolved oxygen, as low as 0.20 mg/liter, and the high ammonia, an average of 0.38 mg/liter (NH3-N), in South New River Canal below S-9 result from the large groundwater contribution that occurs with backpumping. The areal extent and period of degradation in Water-Conservation Area 3 from backpumping is dependent mainly on the amount of flow released from Water-Conservation Area 2, which dilutes and flushes backpumped water. Concentrations of potential contaminants including toxic metals, pesticides, and nutrients, especially phosphorus, are relatively low in the area of South New River Canal affected by backpumping. WATER QUALITY RECORDS FOR THE HUBBARD CREEK WATERSHED, TEXAS, OCTOBER 1969-SEPTEMBER 1972,
Geological Survey, Austin, Tex.
H. J. Davidson.
Open-file report (Texas District), 1973. 81 p, 2 fig, 13 tab.

Descriptors: *Water quality, *Reservoirs, *Texas, *Data collections, *Hydrologic data, Sampling, Chemical analysis, *Electrical conductance.
Identifiers: Hubbard Creek watershed(Tex).

Since February 1962, a network of daily chemical-quality and streamflow stations has been operated in the Hubbard Creek watershed, Texas. Daily specific conductance is measured and selected samples are chosen for chemical analysis depending on the amount of flow at the time of sampling. A compilation is presented of the records for the period October 1969 to September 1972. Periodic surveys of Hubbard Creek Reservoir are made to study salinity stratification. (Knapp-USGS)

HYDRAULIC MODEL EXPERIMENT ON THE DUFFUSION DUE TO THE COASTAL CURRENT,
Kyoto Univ. (Japan). Disaster; Prevention Research Inst.
H. Higuchi, and Y. Iwagaki.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 2, Part 4, Chap 87, p 1357-1376, 1969. 13 fig, 3 tab, 3 ref.

Descriptors: *Harbors, Tidal effects, *Currents(Water), Density, Circulation, Waste disposal, Water pollution sources, Diffusion, Coasts, *Hydraulic models, *Path of pollutants.
Identifiers: *Japan(Kashima Harbor), *Longshore currents, *Tidal currents.

The diffusion phenomena due to the tidal current and the longshore current inside and outside a harbor are studied in a hydraulic model experiment, for which the Kashima Harbor area is used as the prototype. The tidal current, the longshore current and the effect of density are taken into account, but the direct effects of wind and waves are not considered. A model of Kashima Harbor was constructed, and a semidiurnal tide generated by an automatically controlled pneumatic tide generator and longshore current by a water circulating system were provided for it. The water level at 4 stations and current pattern were measured. The diffusion of dyed water from instantaneous point sources and a continuous point source was investigated by the photographic method and dye concentration analysis. (Sinha-OEIS)

BUOYANCY SPREAD OF WASTE WATER IN COASTAL REGIONS,
Vattenbyggnadsbyran Ltd., Stockholm (Sweden).
I. Larsen, and T. Sorensen.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 2, Part 4, Chap 89, p 1397-1402, 1969. 3 fig, 3 ref.

Descriptors: Waste water(Pollution), Density, *Buoyancy, Water pollution sources, Winds, *Heated water, Turbulence, Diffusion, *Waste dilution, Sewage, *Outfall sewers, *Path of pollutants.

Waste water may, due to buoyancy effects, spread horizontally on top of the recipient. The spreading is chiefly determined by the buoyancy flux and to a large extent is unaffected by dilution and diffusion. This phenomenon is of great practical importance for larger outfalls of waste or cooling water in coastal regions. The theory presented takes into account the vertical turbulent diffusion and shows that the spreading of waste water due to density differences is determined chiefly by the buoyancy flux and to a large extent is unaffected by dilution and diffusion. The theory may be expected to give results of the correct order of magnitude. Calculations for outfalls from larger cities will show that the places normally considered sheltered from the outfall zone by a region of considerable turbulent diffusion may in some cases by polluted by poorly diluted waste water. The influence of wind may add significantly to this effect. (Sinha-OEIS)

THE USE OF COMPUTER SIMULATIONS FOR SYSTEMS ECOLOGICAL STUDIES IN THE BALTIC,
Stockholm Univ. (Sweden). Asko Lab.
S. Sjoberg, F. Wulff, and P. Wahlstrom.
Ambio. Vol 1, No 6, p 217-222. 1972, Illus.
Identifiers: *Baltic Sea, Computer models, Ecological studies, Flow, Model studies, *Oxygen, *Phosphorus, *Simulation analysis, Systems analysis.

A model describing the P and O2 flows of the Baltic is presented. Different perturbations of these flows were simulated on a computer, and the results are discussed. The aim of the model is to get a better understanding of which processes are the most critical for the behavior of the Baltic as a whole. The release of phosphate from reduced sediments and the water exchange with the Kattegatt were vital features of the simulated system.--Copyright 1973, Biological Abstracts, Inc.

POLLUTED SNOW IN SOUTHERN NORWAY DURING THE WINTERS 1968-1971,
Oslo Univ. (Norway). Zoological Lab.
K. Elgmork, A. Hagen, and A. Langeland.
Environ Pollut. Vol 4, No 1, p 41-52. 1973. Illus.
Identifiers: Acid, Heavy metals, *Lead, *Norway, Pressure, *Snow, *Sulfur, Winters, *Air pollution, Water pollution sources.

In recent yrs, the snow in southern Norway was laminated with conspicuous grey bands which were considerably more acid, had a higher electrical conductivity and larger amounts of S, heavy metals and other elements than the white layers of the snow. These bands indicate a considerable airborne pollution with values of S up to 8.5 mg/l and of Pb up to 98 microgram/liter, and with pH values down to 3.25 in the melt water. The chemical stratification in the snow was preserved throughout the winter in areas with a cold climate. A regional study of the snow in late winter may thus give information of the distribution of airborne pollution. The acidity and contents of chemical substances in the snow was too high and found over too wide an area to be produced in Norway. The pollution was probably brought in by low pressure systems from the great industrial and urban areas in western and central Europe.--Copyright 1973, Biological Abstracts, Inc.

ZONE OF FLOW ESTABLISHMENT FOR ROUND BUOYANT JETS,
Oak Ridge National Lab., Tenn.
E. Hirst.
Water Resources Research, Vol 8, No 5, p 1236-1246, October 1972. 12 fig, 20 ref.

Descriptors: *Jets, *Buoyancy, *Mixing, *Effluent streams, Density, Flow, Diffusion, Heated water, Temperature, Thermal powerplants, Water temperature, Hydraulics, *Thermal pollution, Water pollution, Mathematical models, Entrainment, Jets.
Identifiers: *Zone of flow establishment, Diffusers.

A method is developed to predict physical properties within the zone of flow establishment (ZFE) for thermal effluents discharged as buoyant jets through round submerged diffuses. The ZFE is the region immediately beyond the diffuser exit in which the mean flow profiles undergo a transition from their internal flow shapes to a free turbulent flow condition. The integral equations of mass, energy, and momentum conservation are used. The solution includes the length of the ZFE and the values of jet width, jet orientation, and center line temperature throughout this zone. The method can predict buoyant jets with three-dimensional trajectories discharged to flowing stratified ambients. Results obtained with the method agree well with the limited experimental data available and with existing empirical correlations. These results provide the necessary initial conditions for conventional (applicable only in the zone of established flow) jet predictions methods; and thus the accuracy of hydrothermal predictions of thermal effluents from power plants will be improved. ON THE STABILITY OF LAMINAR PLUMES: SOME NUMERICAL SOLUTIONS AND EXPERIMENTS,
Cornell Univ., Ithaca, N.Y. Dept. of Mechanical Engineering.
L. Pera, and B. Gebhart.
International Journal of Heat and Mass Transfer, Vol 14, No 7, p 975-984, 1971, 6 fig, 10 ref.

Descriptors: *Laminar flow, *Jets, *Stability, *Buoyancy, Fluid mechanics, Heat transfer, Mass transfer, Flow, Turbulence, Stratification, Thermal properties, Temperature, Stream flow, Numerical analysis, Model studies, Boundary layers, Viscosity.
Identifiers: *Inviscid instability, *Laminar plumes.

An investigation of the hydrodynamic stability of a laminar plume arising from a horizontal line source of heat was carried out using the Tollmien-Schlichting theory of small disturbances. Inviscid solutions of the Orr-Sommerfeld equation were obtained for both symmetric and asymmetric disturbances and the effect of the Prandtl number on the inviscid stability was calculated for asymmetric disturbances. The base flow was found to be less stable for the asymmetric mode. In addition, the full disturbance momentum equations, coupled and uncoupled from the energy equation, were numerically integrated with the boundary conditions appropriate for asymmetric disturbances superimposed on the symmetric plume base flow. Neutral stability curves have been obtained in terms of the Grashof number. The predominance of the assumed asymmetric mode of flow oscillation was verified experimentally by perturbing a plume, in air, with a vibrating ribbon. The experimental results demonstrate that sufficiently high frequency disturbances are stable as they are convected downstream. (Jerome-Vanderbilt)

HEAT - A GROWING WATER POLLUTION PROBLEM,
S. C. Bloom.
Environmental Reporter, Vol 1, No 1, Monograph 4, p 1-21, May 1, 1970. 4 tab.

Descriptors: *Thermal pollution, *Cooling water, *Thermal powerplants, *Reviews, Cooling, Resources, Water resources, Water pollution sources, Electric power production, Aquatic environment, Aquatic life, Legislation, Biological community, Water temperature, Fish, Standards, Administration, Research and development, Mixing, Stratification, Dispersion, Climates.
Identifiers: *Thermal discharges.

Thermal pollution has become a matter of growing conern as the industrial demand for water for cooling and condensing has increased. Electric power production accounts for more than four-fifths of total cooling water use and nearly one-third of all water use. Temperature affects nearly every physical property of concern in water quality management including density, viscosity, vapor pressure, surface tension, gas solubility, and gas diffusion. The reduction in the solubility of oxygen is probably the most important of these effects, as an adequate supply of dissolved oxygen is essential in biological degradation of organic matter in an aerobic environment. While extreme temperatures are lethal to many organisms, moderately raised temperatures may affect the metabolic rates, growth, reproduction and distribution of many aquatic species. Recorded fish kills and other adverse effects due to thermal pollution are discussed. Various federal and state regulatory agencies and codes are generally organized around the amount of temperature increase allowed and the size of the heated-water mixing zone. Limiting temperature criteria in water quality standards for interstate waters are presented. Present research programs are reviewed and alternatives to heat discharge are considered. THE APPLICATION OF NUMERICAL SIMULATION MODELS IN THE ASSESSMENT OF THE EFFECT OF DISCHARGES INTO COASTAL WATERS,
RAND Corp., Santa Monica, Calif.
E. C. Gritton.
Rand Paper No 4948, January 1973. 3 p, 5 ref.

Descriptors: *Discharge(Water), *Mathematical models, *Water quality, *Finite element analysis, Computer models, Thermal powerplants, Nuclear powerplants, Momentum equation, Continuity equation, Cooling water, Temperature, Water pollution, Water temperature, Estuaries, Sea water, Numerical analysis, *Simulation analysis.
Identifiers: Rand water quality model, Coastal seas.

A water quality simulation model was developed for use in well-mixed estuaries and coastal seas. The model is based on the numerical solution by finite difference techniques of the two-dimensional vertically integrated equations of motion and continuity for a fluid. The use of this model is suggested to determine how the discharges from an offshore or coastal nuclear plant would affect the ecology of the receiving waters. These effects consist mainly of an increase in temperature and addition of materials to the water during its passage through the plant for cooling purposes. A model of this type can supply the quantitative information if sufficient field data are available. (Oleszkiewicz-Vanderbilt)

HYDROCARBON AND CHLOROPHYLL: A CORRELATION IN THE UPWELLING REGION OFF WEST AFRICA,
Kiel Univ. (West Germany). Institut fuer Meereskunde.
A. Zsolnay.
Deep-Sea Research, Vol 20, No 10, p 923-925, October 1973. 1 fig, 8 ref.

Descriptors: *Organic compounds, *Chlorophyll, *Phytoplankton, *Sea water, Separation techniques, Upwelling, Analytical techniques, Euphotic zone, Sampling, Statistical methods, Data processing, Adsorption, Water pollution sources, *Atlantic Ocean.
Identifiers: *Data interpretation, Sample preparation.

Seawater samples were taken from 17 stations off West Africa for analysis of hydrocarbon and chlorophyll a content to investigate their possible relationship. Samples were taken in the euphotic zone, usually at 4, 10, 17 and 35 m. The hydrocarbons were extracted from the sea water by shaking each of two 1-litre aliquots of the sample with 10 ml hexane. The extracts were combined and concentrated under vacuum until their volume was 300 microliters. Fifty microliters were then injected on a 10 cm column with a 1.8 mm i.d. containing 0.05-0.2 mm silica gel that had been 5 percent (w/w) deactivated with distilled water. The heat of adsorption detector consisted of two thermistors, one surrounded by an inert material while the other was packed in a material capable of adsorbing hydrocarbons. The resulting heat of adsorption was than a measure of the amount of hydrocarbons present and resulted in one sharp peak within two minutes after injection. Amounts as small as 1 microgram hydrocarbon could be determined with fresh graphite as the adsorbent. A significant linear correlation between the non-aromatic hydrocarbons and the chlorophyll-a content in the euphotic zone of the water off West Africa existed between 4 March and 10 March 1972. This showed that the hydrocarbons present were the result of phytoplankton activity. The line of the estimating equation tended to go through the origin, indicating that the hydrocarbons in the euphotic zone were not due to a pollution source. (Mortland-Battelle)

LABORATORY STUDIES OF THE ACCOMMODATION OF SOME CRUDE AND RESIDUAL FUEL OILS IN SEA WATER,
Bedford Inst., Dartmouth (Nova Scotia).
D. C. Gordon, Jr., P. D. Keizer, and N. J. Prouse.
Journal of the Fisheries Research Board of Canada, Vol 30, No 11, p 1611-1618, November 1973. 5 fig, 6 tab, 11 ref.

Descriptors: *Laboratory tests, *Sea water, *Oil pollution, *Oil wastes, Turbulence, Water temperature, Chemical analysis, Gas chromatography, Oil spills, Organic compounds, Water pollution sources.
Identifiers: Crude oil, Residual fuel oil, Accomodation, *Fate of pollutants, Particulate oil, Subparticulate oil, Aliphatic hydrocarbons, Petroleum hydrocarbons, Flame ionization gas chromatography, Fuel oil, Fluorescence spectrophotometry, Gas liquid chromatography.

To understand more fully the potential availability of petroleum hydrocarbons to marine organisms inhabiting the water column (both in the natural environment and in experimental situations devised to test the effects of hydrocarbons), a series of laboratory experiments were undertaken to study the accommodation of three different types of oil in seawater under different experimental conditions. Concentrations of oil accommodated in seawater under laboratory conditions are directly related to the amount added and the degree of turbulence, but inversely related to temperature. The major fraction (87-98 percent) of this oil is in particulate form ranging in size from about 1 to 30 microns, presumably small droplets. The exact ratio of the particulate to subparticulate fractions is directly related to the apparent viscosity of each individual oil. Of the total amount of oil initially added, 9-15 percent appeared in seawater at the end of the 7-days experiments. Except in the proximity of recent oil slicks, the oil concentrations observed in these experiments are one to two orders of magnitude greater than the concentrations generally observed in the marine environment off eastern Canada. MEASUREMENT OF ADENOSINE TRIPHOSPHATE (ATP) IN TWO PRECAMBRIAN SHIELD LAKES OF NORTHWESTERN ONTARIO,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. W. M. Rudd, and R. D. Hamilton.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1537-1564, October 1973. 8 fig, 1 tab, 16 ref.

Descriptors: *Primary productivity, *Secondary productivity, *Lakes, Measurements, Separation techniques, Filtration, Water analysis, Sampling, Particle size, Carbon, *Canada, Chlorophyll.
Identifiers: *Adenosine triphosphate, Sample preparation.

Water samples were collected in Van Dorn bottles from lakes 227 and 302 in the precambrian shield area of northwestern Ontario for analysis of ATP over several months. Samples were filtered through a 250-micron net and three subsamples prepared for extraction by passing through a 0.22-micron, 47-mm GS Millipore filter and 10-micron and 56-micron nylon mesh filters. ATP analyses were performed under diffuse incandescent light in modified glass scintillation vials. Large seasonal changes were evident, as were specific sites of high biological activity due either to natural stratification or to deliberate manipulation. Chlorophyll a, particulate carbon, and direct count data were found to be misleading in specifying the changes or the sites of biological activity. Analysis of the ATP data on the basis of the relative abundance of different size fractions was found to be useful. An ATP filtration error could not be demonstrated, indicating that cell breakage is not a source of the filtration error inherent in some C-14 primary and secondary productivity studies. (Little-Battelle)
W74-04782

MOVEMENTS OF PHOSPHORUS BETWEEN ITS BIOLOGICALLY IMPORTANT FORMS IN LAKE WATER,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
D. R. S. Lean.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1525-1536, October 1973. 9 fig, 2 tab, 18 ref.

Descriptors: *Phosphorus, *Path of pollutants, *Lakes, *Epilimnion, *Kinetics, *Cycling nutrients, Movement, Model studies, Freshwater, Phosphates, Phosphorus radioisotopes, Filtration, *Organophosphorus compounds, Radioactivity, Ion exchange, Eutrophication, Anionic exchange.
Identifiers: Orthophosphates, Molecular weight, Particulate matter, *Dissolved phosphorus, Membrane filters, Transfer rates, Heart Lake, Colloidal phosphorus.

A model consistent with the kinetics of phosphorus in epilimnetic lake water was developed. Adding P-3204 to lake water and separating the major forms of dissolved phosphorus by Sephadex gel filtration showed that the exchange mechanism between inorganic phosphate and the particulate fraction predominates. At the same time, a low-molecular-weight phosphorus compound is excreted which combines with colloids in lake water, releasing phosphate from the colloid and making the phosphate available for 'transfer' again. This rapid cycling of phosphorus between the four principal forms - the particulate fraction, the low-molecular-weight P compound, colloidal P, and phosphate - appears to contribute to formation of colloids in lake water. No direct complexing of phosphate to the colloid was observed. Only in the presence of algae, bacteria, and other particulate matter did the radioactive phosphorus move to the low-molecular weight and the colloidal forms. The low-molecular-weight compound is negatively charged, as is the colloidal P, but to a lesser degree. Both are removed by anion exchange materials along with phosphate, but the rate that they move into the fraction removed by membrane filtration is different from that for phosphate. This complicates measurements of transfer and makes previous studies on utilization of dissolved organic phosphorus of doubtful value since corrections for filter retention were rarely, if ever, made. DISTRIBUTION AND UPTAKE OF ARTIFICIALLY INTRODUCED RADIUM-226 IN A SMALL LAKE,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
S. Emerson, and R. Hesslein.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1485-1490, October 1973. 3 fig, 1 tab, 12 ref.

Descriptors: *Lake sediments, *Absorption, Ecological distribution, *Detritus, *Canada, Chemical analysis, *Path of pollutants, *Radium radioisotopes, Littoral, Diatoms, Aquatic algae, Deep-water habitats, Water analysis, Adsorption, Bottom sampling, Water sampling, Radioactivity techniques, Lakes.
Identifiers: Ra-226, Epilithophyton, Gas exchange rates, Algal counts, Pollutant removal, Rn-222.

Radium-226 was added to lake 227 of the Experimental Lakes Area in August, 1970, so that gas-exchange rates between the atmosphere and the lake could be traced by its gaseous daughter product radon-222. Although the radium was expected to remain in solution it did so for only about 1 month. An investigation was made to locate the radium after it left solution. Water and deep water surface sediment samples and algal (epilithophyton) and detrital material were analyzed in order to determine radium distribution. Since Ra was found to be highly concentrated in rock scrapings, an attempt was made to correlate Ra uptake with epilithophyton carbon fixation. Algal-detrital material from nonlabelled lakes (lakes 239-and 240) with natural radium activities (0.1 dpm/liter) was analyzed for Ra by liquid scintillation counting in a dioxane fluor. In lake 227 radon activity decreased toward the center, thus confirming that the radon source was the littoral zone. Radium activity of rock scrapings and surface sediment further indicated that radium was concentrated on the littoral bottom surface. Results of two successive scrapings of the same rocks from lake 227 showed that the radium analyzed in these scrapings was concentrated in the algal or detrital coating of the rock and not from the rock itself. Two years after labelling lake 227, activities in the surface sediments below 8 m were as high as 660 dpm/g of dried sediment. Radium uptake had no relation to the carbon fixation rate. Laboratory tests determining radium removal rate indicated no significant difference between removal by unaltered algal-detrital material and boiled algal-detrital material. (Holoman-Battelle)

SOLUBLE PHOSPHATE OUTPUT OF AN AGRICULTURAL WATERSHED IN PENNSYLVANIA,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
W. J. Gburek, and W. R. Heald.
Water Resources Research, Vol 10, No 1, p 113-118, February 1974. 1 fig, 1 tab, 10 ref.

Descriptors: *Phosphates, *Water pollution sources, *Fertilizers, Leaching, Land use, *Pennsylvania, Path of pollutants, *Agricultural watersheds.
Identifiers: *Mahantango watershed(Penn).

Soluble phosphate data were collected from the stream draining a 7.7 sq km Pennsylvania agricultural watershed. The stream approaches constant and low phosphate concentrations of 10 ppb or less PO4-P during continuing base flow recession. Concentrations vary seasonally, 10 to 15 ppb PO4-P commonly occurring in the winter and 20 to 30 ppb occurring in the summer. Less than 2% of the P applied to the watershed as fertilizer is carried out of the watershed by the stream in the soluble form. Most of this output is associated with the high flows and low concentrations found in the early spring. The land adjacent to the stream channel and its indigenous vegetation can be a direct source of soluble phosphate to the stream during periods of precipitation. This makes the PO4-P levels observed at the watershed outlet the result of near- and in-stream processes and reduces the importance of general land use of a watershed as a determining factor in the soluble phosphate concentrations in the stream. DISTRIBUTION OF ORGANIC MATTER AND BACTERIA IN THE UPPER LAYER OF BOTTOM DEPOSIT OF LAKE BALATON,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
J. E. Ponyi, J. Olah, and A. Franko.
Ann Inst Biol (Tihany) Hung Acad Sci. 39: p 141-148. Illus. 1972. (Hungarian summary).
Identifiers: *Bacteria, Bottom deposits, *Distribution, *Hungary(Lake Balaton), Nitrogen, *Organic matter, Water pollution sources.

The upper layer of the bottom deposit in the open water of Lake Balaton (Hungary) is poor in organic materials. The values obtained were 3-4% except for the Bay of Keszthely where values of 8-9% were registered. Noteworthy quantitative differences in the organic matter content between the different points of the individual transversal sections were found only in the Bay of Keszthely. Values of Kjeldahl-N content in the different areas of bottom are nearly identical (0.3-0.5%). Amounts of HCl-soluble materials in the Bay of Keszthely and its neighborhood are 46-51% and in the other areas of the lake over 60%, and proceeding from the southern shore northward the amounts increase in most of the transversal sections. Average bacterial counts and the amounts of the 3-5 micro fractions of particulate organic materials in the bottom are generally higher in the Bay of Keszthely and its neighborhood than in other areas of the lake. The quantitative distribution of bacteria and particulate organic materials along the transversal sections is heterogeneous.--Copyright 1973, Biological Abstracts, Inc.

AN EXPERIMENT IN SANITARY-VIROLOGICAL RESEARCH ON SEWAGE, (IN RUSSIAN),
A. P. Markov.
Gig Sanit. 37(2): 94-95. 1972.
Identifiers: Agglutination, Centrifugation, Cultures, Embryo, Erythrocyte, Ether, Fibroblast, Penicillin, *Sanitary engineering, *Sewage, Streptomycin, Tampon, *Virological research, *Enteroviruses, Antibiotic treatment.

Wide distribution of enteroviruses in sewage was established. A study done from 1968-1970 isolated viruses from sewage obtained by the tampon method. After centifugation, part of the sample was treated with antibiotics (penicillin and streptomycin) and the rest with ether. Pathogenic agents were identified by hemagglutination with human erythrocytes, hemagglutination lag and neutralization with type-specific sera. Strains (40) of virus were isolated from samples treated with antibiotics and 28 strains from samples treated with ether. In human embryo fibroblast cultures, 72 virus strains were isolated from samples treated with antibiotics and 38 strains from samples treated with ether. Partial loss of viruses apparently occurs during antibiotic treatment.--Copyright 1973, Biological Abstracts, Inc.

SALMONELLA SEROTYPES IN SEWAGE OF VARIOUS ORIGINS,
Nauchno-Issledovatelskii Institut Gigieny, Moscow (USSR).
G. P. Kalina, and V. L. Shiganova.
Gig Sanit. 37(2): 104-106. 1972.
Identifiers: Animal, Birds, Cat, Cattle, Cold, Dog, *Epidemiology, Meat, Processing, Rodent, *Salmonella serotypes, *Sewage, Strain, Swine, *Enterobacteria.

Pathogenic enterobacteria were studied in waste fluids from 3 drains of a meat reprocessing plan (MRP), 2 of which contained manufacturing waste and 1 containing fecal material, and 2 aeration stations (AS) containing fecal waste before and after sterilization. Strains of Salmonella (194) of various serotypes were isolated. In MRP sewage, groups E anc C1 (12 strains) predominated, in AS sewage, serogroup B predominated. Some group D Sal-

monella were found in MRP samples. C2 was distributed almost evenly in both. Three types of Salmonella are discussed: those associated with humans, rodents, dogs, and cats, those associated with cattle, swine and domesticated birds, and those associated primarily with wild birds and cold blooded animals. Numerous examples are given. The determination of Salmonella serotypes in various types of sewage is of epidemiological and sanitary importance.--Copyright 1973, Biological Abstracts, Inc.

NUTRIENT INCOME CHANGE RELATED TO PLANKTON ALGAE,
Washington Univ., Seattle. Dept. of Civil Engineering.
E. B. Welch, R. M. Emery, C. E. Moon, and D. Spyridakis.
Completion Report, August 25, 1972. 39 p, 7 fig, 8 tab, 18 ref. OWRR A-045-WASH(1).

Descriptors: *Diversion, *Phosphorus, *Eutrophication, *Mesotrophy, Plankton, *Washington, Lakes, Lake sediments, Nutrients, *Phytoplankton, Productivity, Anaerobic conditions, Nitrogen, Iron.
Identifiers: *Lake Sammamish(Wash).

Lake Sammamish, which lies about 12 miles east of Seattle, Washington, with moderate depth (mean 17.7m) and area (19.8 km sq.), can be classified mesotrophic. While diversion of over 1/2 the phosphorus (P) from nearby Lake Washington during 1963-67 was followed by reduction in winter mean P content and a rapid shift from eutrophy to mesotrophy (Edmondson, 1970), mean winter P content and measured characteristics of plankton response have not changed significantly in Lake Sammamish following a diversion of similar magnitude. Annual nutrient budgets suggest a reduction in sedimented P since diversion but little change in the quantity of P released from anaerobic sediment. P availability in the water column (winter mean content) appears to be controlled by iron precipitation to a greater extent than in Lake Washington. Experiments in situ show that nitrogen and P are equally limiting to summer phytoplankton productivity, but as found in Lake Washington, P may be of more long term significance. Urban runoff is apparently not enriching the lake to a great extent and therefore has probably not retarded the recovery of the lake.

VERTICAL DISTRIBUTION OF FISHES RELATIVE TO PHYSICAL, CHEMICAL AND BIOLOGICAL FEATURES IN TWO CENTRAL ARIZONA RESERVOIRS,
Arizona State Univ., Tempe.
P. O. Bersell.
Available from NTIS, Springfield, Va 22151 as COM-73-11333 Price $5.75 printed copy; $1.45 microfiche. M Sc Thesis, September 1973. 65 p, 9 fig, 10 tab, 33 ref.

Descriptors: *Reservoirs, *Arizona, *Fish populations, Water pollution effects, Variability, Ecology, *Food chains, Seasonal, Aquatic populations, Ecosystems, Thermal stratification, Euphotic zone, Dissolved oxygen, Chlorophyll, Plankton, Water temperature.

Distribution of fishes in two central Arizona reservoirs was studied by vertical gill netting, stressing intra- and inter-lake variability. Transects were established and sampling was performed three times a year in an attempt to examine variations during ecological seasons. Data on fish distributions, other biotic factors, and selected physicochemical features were obtained. Multiple linear regression analysis was employed to determine which abiotic and biotic features were most important to vertical dispersion of fishes. Despite high variability and often small sample size, data suggested dissolved oxygen, chlorophyll-a, plankton, and to a far lesser extent, temperature, were important factors in fish dispersion patterns. Vertical light penetration (depth of the euphotic zone) seemed to act in a more subtle, indirect manner in its influence on fishes. Species interactions were noted and foodchain relationships seemed apparent in many instances. The majority of all fishes netted in the study (1970-71) were within the upper 10 m of the water column in both reservoirs. (Knapp-USGS)

BIOCHEMICAL ECOLOGY OF WATER POLLUTION,
Ohio State Univ., Columbus. Dept. of Microbiology.
P. R. Dugan.
Plenum Press, New York, N.Y. (and London, England), 1972. 159 p, 37 fig, 17 tab, 144 ref. Price: $14.50.

Descriptors: *Water pollution effects, *Aquatic life, *Water properties, *Ecology, *Pollutants, Toxicity, Water pollution, Water pollution sources, Organic loading, Organic compounds, Nutrients, Eutrophication, Lakes, Water types, Biodegradation, Biochemistry, Water chemistry, Pesticides, Detergents, Carbohydrates, Proteins, Amino acids, Lipids, Lignins, Water resources, Water supply, Hydrologic cycle, Inorganic compounds, Radioactive wastes, Thermal pollution, Mine drainage.

Information is presented on biological and biochemical reactions important to the understanding of water pollution and its effects on organisms at the cellular and molecular levels. The 12 chapters deal with the following topics: Significance of water pollution; Causes and types of pollutants (inorganic, organic, toxic, radioactive, pathogenic, thermal, etc.); Water availability and use (hydrological cycle, first- and second-order pollution); Biochemical aspects of pollution; Ecological concepts such as symbiosis; Chemical, physical, and biological characteristics of water; Degradation of organic pollutants (hydrolytic, oxidative, and dissimilative reactions of polysaccharides, proteins, fats, amino acids, etc.); Recalcitrant molecules (ENVIRONMENTAL PROTECTION FACILITIES AT THE RECENTLY EXPANDED PULP AND PAPER MILL OF Continental Can Co. in Hodge, La., is an effluent decoloring system, in which lime is added to the waste waters entering the first clarifier stage. Sludge from this primary clarifier, including precipitated color bodies, is incinerated in the mill's lime kiln for recovery of lime. Dissolved lime remaining in the clarified effluent is recovered by treatment with lime kiln stack gases which provide the carbon dioxide needed to precipitate dissolved lime as Ca carbonate. The pH of the clarifier effluent is adjusted before it enters the oxidation ponds for secondary treatment. Air pollution abatement facilities at the mill are also described. (Witt-IPC)

A PRELIMINARY SURVEY OF THE POSSIBLE CONTAMINATION OF LAKE NAKURU IN KENYA WITH SOME METALS AND CHLORINATED HYDROCARBON PESTICIDES,
Utrecht Rijksuniversiteit (Netherlands). Inst. of Veterinary Pharmacology and Biological Toxicology.
J. H. Koeman, J. H. Pennings, J. M. De Goeij, P. S. Tjioe, and P. M. Olindo.
J Appl Ecol. Vol 9, No 2, p 411-416, 1972, Illus.
Identifiers: Birds, *Chlorinated hydrocarbon pesticides, *Copper, Fish, *Kenya(Lake Nakuru), Lakes, Metals, Pesticides, Survey, Toxicity, *Zinc, Soda-lakes.

In the period of sampling, chlorinated hydrocarbon pesticides and 6 selected metals probably did not represent a hazard to the fish and birds in Lake Nakuru. With respect to Zn and Cu a more detailed study will be required to measure the toxicity of these elements alone and in combination under the peculiar environmental conditins of this soda-lake. This type of information will be needed for the evaluation of tolerance limits with regard to pollution problems which may arise in the future. These data should provide useful baseline information for monitoring future trends of pollution in this part of the world.--Copyright 1973, Biological Abstracts, Inc.

WATER QUALITY REQUIREMENTS OF AQUATIC INSECTS,
Utah Univ., Salt Lake City. Dept. of Botany.
A. R. Gaufin.

Copy Available from GPO Sup Doc as EP1.23:660/3-73a004, $1.20; microfiche from NTIS as PB-228 582, $1.45. Environmental Protection Agency Ecological Research Series Report, EPA-660/3-73-004, September 1973. 89 p, 3 fig, 15 tab, 50 ref. EPA Project 18050 FLS.

Descriptors: Water pollution effects, Water quality, *Aquatic insects, *Thermal pollution, *Dissolved oxygen, *Hydrogen ion concentration, Diptera, Mayflies, Stoneflies, Mayflies, Caddisflies, Water temperature.
Identifiers: Pollution evaluation, Water quality criteria, Receiving waters, *Water quality requirements, Trichoptera.

The larvae of twenty species of aquatic insects (Diptera, Ephemeroptera, Plecoptera, and Trichoptera) and the scud (Amphipoda) were exposed to high water temperatures, low dissolved oxygen concentrations, and low pH to determine their tolerance of these three environmental factors. The temperature at which 50% of the specimens died after 96 hours exposure ranged from 11.7C for the mayfly. Cinygmula par Eaton, to 32.6C for the snipe fly, Atherix variegata Walker. The mayfly, Ephemerella doddsi Needham, was most sensitive to low dissolved oxygen levels with a 96-hour TLm of 5.2 mg/1. Acroneuria pacifica Banks, a stonefly, was the most resistant with a TLm 96 of 1.6 mg/1. Median tolerance levels for pH ranged from pH 2.7 for the caddis fly, Limnephilus ornatus Banks, to 7.2 for the scud, Gammarus limaeus Smith. Longer term bioassays clearly indicated increased sensitivity and mortality of the test specimens with increased length of exposure to each of these factors. To maintain a well-rounded diversified population of cold water aquatic insects, maximum temperatures, minimum dissolved oxygen levels, and the pH range should not exceed the requirements of cold water fishes, such as trout and salmon. While some aquatic insects can tolerate dissolved oxygen levels as low as 1.6 mg/1 for short periods, concentrations of 6.0 mg/1 are required for long-term survival. Temperatures during the winter months must be maintained at normal seasonal levels to prevent premature emergence. Temperatures above 65F during the summer months are considered the maximum for maintaining many species of stoneflies, mayflies, and caddis flies. A pH range of 6.0-8.5 should protect most cold water lotic insects. (EPA)
W74-04551

EFFECT OF PHOSPHORUS REMOVAL PROCESSES ON ALGAL GROWTH,
California Univ., Irvine.
J. Scherfig, P. S. Dixon, R. Appleman, and C. A. Justice.
Copy Available from GPO Sup Doc as EP1.23:660/3-73-015, $1.20; microfiche from NTIS as PB-228 585. Environmental Protection Agency Ecological Research Series Report EPA-660/3-73-015, September 1973, 81 p, 13 fig, 41 tab, 11 ref. EPA Project 16010 GJH.

Descriptors: *Bioassay, *Algal control, Assay, Tertiary treatment, Eutrophication, Water reclamation, Nutrients, Phosphorus, Waste water treatment, Sewage treatment, California, Water pollution effects.
Identifiers: *Phosphorus removal, *Algal assay procedures, Growth limiting nutrients, Algae growth control, Batch algal assays, Continuous culture assays, Santee(Calif).

Laboratory studies were conducted to improve algal assay techniques for use in evaluation of sewage treatment processes. Laboratory studies (batch and continuous cultures) were conducted at the Santee California water reclamation plant to evalute the effect of tertiary waste treatment processes on the amount of algal growth in the treated effluent. Laboratory studies were also conducted to determine the growth limiting nutrients in each type of tertiary effluent. Field tests were conducted using special study ponds and the results of the field tests were compared with the laboratory test results. The laboratory and field tests showed the same relative ranking for the treated effluents. (EPA)

THE EFFECTS OF METHOXYCHLOR ON AQUATIC BIOTA,
Michigan Dept. of Natural Resources, Ann Arbor. Inst. for Fishery Research.
J. W. Merna, and P. J. Eisele.
Copy Available from GPO Sup Doc as EP1.23:73-046, $0.95; microfiche from NTIS as PB-228 643 $1.45. Environmental Protection Agency Ecological Research Series Report EPA-R3-73-046, September 1973. 59 p, 13 fig, 22 tab, 22 ref. EPA Project 18050 DLO.

Descriptors: *Pesticide toxicity, Pesticides, *Bioassay, Lethal limit, Biota, *Fish reproduction, *Yellow perch, Minnows, Water pollution effects.
Identifiers: Phytotoxicity, Fish toxicity, Fathead minnows, TL-50, *Fathead minnows, Gammarus pseudolimnaeus, Orconectes virilis, *Methoxychlor.

Continuous-flow bioassays yielded 96-hour TL50 values for invertebrates ranging from 0.61 microgram/1 for Gammarus pseudolimnaeus to 7.05 microgram/1 for Orconectes virilis. Fathead minnows (Pimephales promelas) and yellow perch (Perca flavescens) had 96-hour TL50 values of 8.63 and 22.2 micrograms/1 respectively. Hatching of fathead minnow eggs was inhibited at all levels of exposure tested between 1.0 and 0.125 microgram/1. There was no spawning at 2 microgram/1. Growth of yellow perch was retarded at all levels tested between 5.0 and 0.625 micrograms/1. All perch died at 10 micrograms/1 during the growth study. Perch which had been subjected to long-term exposure to 5 microgram/1 of methoxychlor had an abnormally high oxygen demand when held in a respirometer with a water velocity of 0.6 foot per second. ECOLOGICAL INVESTIGATIONS OF PONDS WITH SPECIAL REGARD TO THE CONSEQUENCES OF WATER POLLUTION BY OIL, (IN GERMAN),
Kiel Univ. (West Germany). Zoologisches Institut.
W. Jahn.
Arch Hydrobiol. Vol 70, No 4, p 442-483. 1972, Illus. (English summary).
Identifiers: *Aquatic insects, Ecologicsl studies, *Germany, *Mussels, *Oil pollution, Ponds, *Snails, Water pollution effects.

The occurrence of most species in 13 ponds in NW-Germany did not depend on the type or on the site of the pond. Only a few of the species preferred either wood-ponds or ponds in the open cultivated areas. Ponds refilled with water after desiccation were immediately recolonized by species that had survived in the bottom. Other species immigrated by flight or by crawling from their hiding places in a regular sequence. When the water surface was polluted by thin layers of motor oil many of the aquatic insects were killed. The dangerous effects of the oil decreased rapidly within a few days. Snails and mussels fed on oil and even reproduced later on. The fauna which did not come into direct contact with the film of oil was endangered by oil only above a high concentration.--Copyright 1973, Biological Abstract, Inc.

THE RELATION BETWEEN PHYTOPLANKTON AND PHOSPHATE IN THE LAKE OF CONSTANCE, (IN GERMAN),
Staatliches Institut fuer Seenforschung und Seenbewirtschaftung, Konstanz (West Germany). Abteilung Max Auerbach-Institut.
H. Lehn.
Arch Hydrobiol. Vol 70, No 4, p 556-559. 1972, Illus, (English summary).
Identifiers: *Germany(Lake of Constance), Lakes, *Phosphates, *Phytoplankton, *Phosphorus.

Since 1920 two criteria of water quality, the phosphate-phosphorus-concentration during winter circulation and the phytoplankton density, have increased greatly. In the half-logarithmic system of coordinates a straight line runs through the relative points, and this is higher in the shallow Gnadensee than in the deep Obersee. With increasing phosphate concentration the efficiency of phytoplankton production in both basins of the lake decreases logarithmically.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF TOXICANTS ON BRACKISH-WATER PHYTOPLANKTON ASSIMILATION,
Institute of Marine Research, Helsinki (Finland). Biology Div.
A. Niemi.
Comment Biol Soc Sci Fenn. 55. p 1-19. 1972. Illus.
Identifiers: Brackish water, *Copper ions, *Cyanides, *Phenols, *Phytoplankton, Potassium cyanide, *Sulfates, Toxicants, Water pollution effects, *Finland.

The acute effect of CuSO4, pure phenol and KCN on the assimilation rate and dark fixation of vernal, early summer and late summer phytoplankton communities was studied in situ at Tvarminne Zoological Station, south coast of Finland. Low concentrations of all the 3 chemicals had a stimulating effect. At a certain concentration of each chemical, an inhibitory effect became apparent in both assimilation and dark fixation tests. At higher concentrations the inhibitory effect was total in the assimilation, but the dark fixation values did not decrease to zero. There was no clear difference in the susceptibility of vernal, early summer and late summer phytoplankton communities to the toxicants, except that the vernal phytoplankton community seemed to be less susceptible to ionic Cu than the other communities. This may depend on differences in the species composition between the vernal and summer communities.--Copyright 1973, Biological Abstracts, Inc.

CALCULATION OF THE CONCENTRATION OF THE BIOMASS OF BLUE-GREEN ALGAE DURING SETTLING, (IN RUSSIAN),
Ukrainskii Nauchno-Issledovatelskii Institut Gidrotekhniki i Melioratsii, Kiev (USSR).
I. I. Kalantyrenko.
Gidrobiol Zh. Vol 8, No 5, p 127-132. 1972. Illus.

Identifiers: *Algae, *Biomass, Calculations, Reservoirs, Settling, *Cyanophyta, *Eutrophication, *Bioassay.

In connection with the problem of water bloom in reservoirs due to the massive reproduction of blue-green algae, the problem of removing the algae from the water and concentrating them is discussed. One of the ways of obtaining the algal biomass consists in collecting the concentrated masses at 'bloom spots' by floating pump plants which are equipped with suction devices that gather and pump only the upper water layer most saturated with algae. Formulas are given for determining the rate of settling of the water-alga mixture, during which the algae usually floats, forming on the surface of the settling tank a more concentrated biomass layer.--Copyright 1973, Biological Abstracts, Inc.

TEMPERATURE ACCLIMATION IN THE MEDUSA, CHRYSAORA QUINQUECIRRHA,
Georgetown Univ., Washington, D.C. Dept. of Biology.
R. S. Blanquet.
Comparative Biochemistry and Physiology, Vol 43B, No 3B, p 717-723, 1972. 3 fig, 19 ref.

Descriptors: Adaptation, *Aquatic animals, *Enzymes, *Metabolism, *Temperature, Biochemistry, Physiology, Reproduction, Environmental effects, Thermal pollution, Laboratory studies, *Chesapeake Bay, Water pollution effects.
Identifiers: *Medusa.

The levels of the two enzymes, Glucose-6-phosphate dehydrogenase and 6-phosphogluconic acid dehydrogenase, were chosen as indices for this investigation of the Cnidarian thermal acclimation of this medusa species. Chrysaora polyps possessing G6PDH and 6PGDH were acclimated to cold and warm water and the enzyme activity was assayed. G6PDH activity was observed but there was little or no 6PGDH activity. Cold acclimated animals demonstrated a dramatic rise in G6PDH specific activity at all substrate concentrations and temperatures tested. This increase was accompanied by a reduced Michaelis constant and energy of activation. A temperature dependent change occurred at about 10C in both groups so that specific activity was greater at that temperature than at 15C. This was more pronounced in the cold acclimated animals. It is suggested that these data are of adaptive significance with respect to pedal cyst formation at low ambient temperatures. (Jerome-Vanderbilt)

THERMAL RESPONSES IN CIRRHINA MRIGALA FRY,
Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.
M. C. Balani, and R. Viswanathan.
Current Science, Vol 42, No 6, p 192-194, March 20, 1973. 4 fig, 2 tab, 7 ref.

Descriptors: *Carp, *Temperature, *Fish behavior, *Mortality, Aquatic environment, Aquatic animals, Toxicity, Indicators, Laboratory tests, Evaluation, Heat, Physiology, Pathology, Thermal pollution, *Thermal stress.

Temperature plays a dominant role in regulating growth, reproduction, and other aspects of physiology in aquatic species. Studies of the reactions of aquatic organisms to temperature shifts are of particular significance to commercial fisheries. The opercular movement is a conventional indicator of fish response to thermal stress, but the temperature of loss of equilibrium is now considered to be a more effective death point indicator. Results of responses of carp fry exposed to conditions of thermal stress and shock are presented. Elevated water temperatures ranged from 30 to 39C. The median lethal temperature was 37.8C. Significant differences in thermal responses were observed between fry and fingerlings. A high rate of mortality was observed when fry were returned to non-lethal temperatures after being exposed to thermal shock at 38.0 and 39.2C. (Jerome-Vanderbilt)

EFFECTS OF TEMPERATURE ON DEVELOPING MERISTIC STRUCTURES OF SMALLMOUTH BASS, MICROPTERUS DOLOMIEUI LACEPEDE,
Pan American Univ., Edinburg, Tex. Dept. of Biology.
C. R. Wallace.
Transactions of the American Fisheries Society, Vol 102, No 1, p 142-145, 1973. 3 fig, 1 tab.

Descriptors: *Bass, *Temperature, *Growth rates, *Fish physiology, Environmental effects, Aquatic environment, Fish, Cytological studies, Inhibitors, Mortality, Laboratory tests, Measurements, Evaluation, Water temperature, Water pollution effects.
Identifiers: *Meristic structures.

Environmental temperatures affect the number of meristic structures in some fish. Generally, highest meristic structure counts in fishes are associated with lower temperatures and longer development and the lowest counts are associated with higher temperatures and rapid development. Studies were conducted to determine the effects of temperature on the numbers of lateral line scales, right and left pectoral fin rays, dorsal fin soft rays and spines, and anal fin soft rays and spines of laboratory raised smallmouth bass. Eggs were collected, divided into 5 groups and placed in constant temperature tanks set at 17, 20, 23, 26 and 29C. All smallmouth bass were raised to approximately 40-75 mm in total length, killed and subjected to meristic counts. Definite relationships were found between temperature and mean numbers of lateral line scales, anal spines and dorsal soft fin rays; while right and left pectoral fin rays, dorsal spines and anal soft fin rays were not significantly different. Mean numbers of lateral line scales for the five temperature lots yielded a sigmoid curve, higher at 20 and 29C than at 17, 23 and 26C. Mortality was the highest at 17C (84.3%) and 29C (95.4%). The lowest mortality occurred at 23C (35.1%). (Jerome-Vanderbilt)

THE PREFERRED TEMPERATURE OF FISH AND THEIR MIDSUMMER DISTRIBUTION IN TEMPERATE LAKES AND STREAMS,
Department of Lands and Forests, Maple (Ontario). Research Branch.
R. G. Ferguson.
Journal of the Fisheries Research Board of Canada, Vol 15, No 4, p 607-624, 1958. 7 fig, 3 tab, 39 ref.

Descriptors: *Fish, *Yellow perch, *Water temperature, *Distribution patterns, Aquatic environment, Aquatic animals, Fish behavior, Temperature, Laboratory tests, On-site data collections, Heated water, Lakes, Canada, Wisconsin, Tennessee, Trout, New York, Bioassay, Seasonal, Statistical methods, Perches.
Identifiers: *Thermal preference.

Laboratory studies of preferred temperature with yellow perch are compared with 21 other species. These show that temperature, if acting alone, can determine the distribution of fish. Factors such as light, conditioned responses related to feeding, and social behavior interfere with the expression of the response to temperature. The level of thermal acclimation influences the range of temperature preferred. In general the preferred temperature is considerably higher than the acclimation temperature at low thermal acclimations but the difference decreases up to the final preferendum where both coincide. Summer field observations of yellow perch in three lakes in Ontario showed average thermal distribution of 19.7, 21.0, and 21.2C. These temperatures agree well with data from 4 Wisconsin lakes. Oxygen depletion, distribution of primary prey species and other factors are shown to modify the thermal distribution in nature. The agreement between laboratory studies performed with older fish and the field observations was excellent. (Jerome-Vanderbilt)

TEMPERATURE REQUIREMENTS FOR EMBRYOS AND LARVAE OF THE NORTHERN PIKE, ESOX LUCIUS (LINNAEUS),
National Water Quality Lab., Duluth, Minn.
K. E. F. Hokanson, J. H. McCormick, and B. R. Jones.
Transactions of the American Fisheries Society, Vol 102, No 1, p 89-100, 1973. 5 fig, 5 tab, 25 ref.

Descriptors: *Aquatic environment, *Temperature, *Growth rates, *Embryonic growth stage, *Pikes, Aquatic animals, Fish, Environmental effects, Mortality, Growth stages, Larval growth stage, Metabolism, Biomass, Laboratory tests, Bioassay, Evaluation, Water pollution effects.
Identifiers: *Northern pike, Tolerance limits, Heat stress.

Several bioassay methods, responses and end points were evaluated for use in determining the temperature requirements of northern pike embryos. Emphasis was placed on evaluating the relative effects of temperature on embryo survival by correcting for differences in fertilization success among experiments. The most variable end point among experiments was the optimum temperature; while the most reproducible end point was the median tolerance limit (TL50). The lower and upper TL50's were 6.9 and 19.2C for normal hatch

and 6.3 and 19.9C for total hach. The age of the embryo at the time of exposure had a great effect on these tolerance limits. The 1-day upper TL50 for newly hatched and swimming yolk-sac larvae was 28.4C when acclimated to 17.7C. Both larvae stages survived a lower limit of 3.2C for 7 days. Newly hatched yolk-sac larvae were more sensitive than swimming yolk-sac larvae to 7-day exposures to high temperatures. Growth of larvae was maximum at 26C and negligible below 7C. The high larval growth at 26C was offset by an increased mortality rate during the first 2 weeks of life. Net biomass change was highest at 21C. (Jerome-Vanderbilt)

EFFECT OF LIGHT ON VULNERABILITY OF HEAT-STRESSED SOCKEYE SALMON TO PREDATION BY COHO SALMON,
Virgin Islands Dept. of Conservation and Cultural Affairs, Charlotte Amalie, St. Thomas.
J. R. Sylvester.
Transactions of the American Fisheries Society, Vol 102, No 1, p 139-142, 1973. 1 fig, 1 tab, 8 ref.

Descriptors: *Fish behavior, *Salmon, Swimming, Heat, *Predation, *Light, Aquatic environment, Pink salmon, Chum salmon, Sockeye salmon, Temperature, Environmental effects, Fish migration, Stress, Mortality, Laboratory tests, Water temperature, Statistical analysis, Water pollution effects.
Identifiers: *Heat stress.

Light has been shown to affect the migratory behavior of pink, chum and sockeye salmon. Migration during darkness is assumed to be an anti-predator trait. The effect of darkness on untreated and heat-treated sockeye salmon in avoiding coho salmon was investigated. Ten tests were conducted under each of the following conditions; (1) under light with the prey receiving no heat dose; (2) under darkness with the prey receiving no heat dose; (3) under light with the prey receiving a heat dose; and (4) under darkness with the prey receiving a heat dose. Darkness greatly increased survival in prey which both received and did not receive a heat dose. There was a greater proportionate increase in prey survival between light and darkness with no dosage, than between light and darkness with a dosage. A significant interaction was found between light and dose conditions. The coho salmon predators seemed to be aided in locating their prey at night by the erratic swimming of heat-stressed sockeye salmon. (Jerome-Vanderbilt)

A FIND OF MARSH SANDPIPER TRINGA STAGNATILIS IN THE NETHERLANDS,
Amsterdam Univ. (Netherlands). Inst. of Taxonomic Zoology.
E. R. Osieck, and C. S. Roselaar.
Limosa. Vol 45, No 3/4, p 135-138. 1972. (English summary).
Identifiers: Anas-crecca, Anas-strepera, Avocet, *Clostridium-botulinum, Gallinago-gallinago, *Marsh sandpiper, Molting Mortality, *Netherlands, Poisoning, Shelduck, Snipe, Tadorna-tadorna, Teal, Tringa-stagnatilis, *Bacterium, *Waterfowl.

During the hot summer of 1971 the circumstances in the shallow waters of the Dutch new polder Zuidelijk Flevoland were appropriate for the development of the bacterium Clostridium botulinum, type C. The toxin of this bacterium causes food poisoning, botulism, in waterfowl. Thousands of birds were found dead or dying, most of them teal Anas crecca, but also numbers of snipe Gallinago gallinago, shelduck Tadorna tadorna, gadwall Anas strepera, and avocets Recurvirostra avosetta. Among these birds a marsh sandpiper Tringa stagnatilis was found. It is the first such bird collected in the Netherlands and was placed in the collection of the Zoological Museum in Amsterdam. According to plumage and gonads it was a first calendar year bird, molting into winter plumage. The last few years this species has been seen almost once a year in the Netherlands, the first one being observed in 1958.--Copyright 1973, Biological Abstracts, Inc.

CHEMICAL ECOLOGY: EVIDENCE FOR PHOSPHATE AS THE ONLY FACTOR LIMITING ALGAL GROWTH IN LAKE KINNERET,
Weizmann Inst. of Science, Rehovoth (Israel). Isotope Dept.
M. Halmann.
Isr J Chem. Vol 10, No 4, p 841-855. Illus. 1972.
Identifiers: *Algal growth, Chemical ecology, Growth rates, *Israel(Lake Kinneret), Lakes, *Nitrates, *Phosphates, Nutrients.

Experiments on the growth of the natural populations of algae and of other microorganisms as a function of the supply of various nutrients was carried out for Lake Kinneret (Israel) water sampled at about 2 wk intervals during Jan-June 1972. The addition of orthophosphate caused a rapid rise in biomass, which, after several days, increased to 2-5 times that in untreated water, as measured by the increase in turbidity and protein content. The addition of NaNO3 or KNO3, NH4Cl, ferrous ethylenediamine sulfate, sodium silicate or vitamin B12 had no noticeable effect. The plot of biomass versus the concentration of phosphate is a steeply rising function in the range of 0.1 to 1.0 microgram molar orthophosphate, which levels off at higher phosphate concentrations, reaching saturation above about 2 microgram molar phosphate. Thus, in the range of its natural concentration in Lake Kinneret, 0.09-0.5 microgram molar, orthophosphate is the limiting factor. At about 2 microgram molar phosphate, nitrate becomes the limiting factor, as was shown by experiments in which both phosphate (> 2 microgram molar) and nitrate were added, resulting in extremely abundant algal growth. A model of the reduction of nutrient input was achieved by laboratory experiments, in which the lake water was diluted with distilled water (by 1/4), thus resulting in an approximately proportional (to about 1/4) decrease in biomass. The effect of restoring the natural concentration of either nitrate or orthophosphate was then measured. Added nitrate had no effect, while added phosphate caused a rapid increase in biomass, which after 2-4 wk came close to that in the natural lake water. These results indicate that during the spring of 1972, P has been the only element limiting algal growth in the lake.--Copyright 1973, Biological Abstracts, Inc.

A POSSIBLE EXPLANATION FOR THE DIFFERENCES IN THE FATTY ACID COMPOSITION OF FRESH-WATER AND MARINE FISHES,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
T. Farkas.
Ann Inst Biol (Tihany) Hung Acad Sci. 38: p 143-152, 1971, Illus.
Identifiers: *Algae, Crustacea, Diatoms, *Fatty-Acids, Fishes, Water pollution effects, *Cyanophyta, *Chlorophyta, Plankton.

The differences in the levels of linoleic and linolenic acids can be traced to the differences in species composition of phytoplankton in seas and inland waters. In marine phytoplankton the diatoms with low level of linoleic and linolenic acids predominate. In fresh-water bodies, however, the green and blue-green algae with high levels of both fatty acids prevail. The distribution of these fatty acids in the fats of herbivorous planktonic crustaceans shows the same pattern as in their food. Although both marine and fresh-water fishes were able to desaturate and change linoleic and linolenic acids to long chain polyunsaturated fatty acids, the bulk of these fatty acids originates in lower trophic levels. Some planktonic crustacean species are able to regulate the levels of these fatty acids in their phospholipids according to the environmental temperature. Decrease in the environmental temperature results in an increase of eicosa-, and docosapolyenoic fatty acids in both fresh-water and marine crustaceans. The distrubution of long chain polyunsaturated fatty acids in the triglycerides of marine and fresh-water fishes is similar to that in their natural food. Planktonic crustaceans and fishes can dehydrogenate saturated fatty acids of both endogenous and exogenous origin. This process may modify the ratio of saturated to monounsaturated fatty acids in higher trophic levels as compared to the phytoplankton.--Copyright 1973, Biological Abstracts, Inc.

MORPHOLOGICAL VARIATION OF KERATELLA COCHLEARIS (GOSSE) (ROTATORIA) IN SEVERAL MASURIAN LAKES OF DIFFERENT TROPHIC LEVEL,
Polish Academy of Sciences, Warsaw. Inst. of Ecology.
A. Hillbricht-Ilkowska.
Pol Arch Hydrobiol. Vol 19, No 3, p 253-264. 1972. Illus.
Identifiers: *Keratella-cochlearis, Lakes, Morphological studies, Phytoplankton, *Poland(Lake Mikolajskie), *Rotatoria, Seston, Trophic levels, *Eutrophication.

The occurrence of K. cochlearis f. tecta in several water bodies, differing morphologically and trophically, was analyzed, and the occurrence of this form and morphological variation of individual K. cochlearis in the eutrophic Lake Mikolajskie was examined in detail. This species occurs chiefly in the epilimnion, more abundantly and persistently in deeper lakes in comparison to shallower ones, whereas within morphologically similar lakes, it is more numerous in fertile ones. The average size of individuals of K. cochlearis occurring in Lake Mikolajskie is smaller in Aug. than in June, at similar thermal conditions, but different phytoplankton abundance, and attains its maximum in Aug. (biomass about 15 mg/l). The size of individuals of K. cochlearis, including tecta forms occurring in the epilimnion is smaller by 20-25% than that of individuals found in the metalimnion and hypolimnion. The differentiation of individuals is maintained during the whole summer season (comparison was made of results from mid-

June and mid-Aug.) and during the 24 hr cycle.--Copyright 1973, Biological Abstracts, Inc.

PRINCIPLES OF EVALUATING EFFECTS OF THERMAL DISCHARGES ON SURFACE WATERS (GRUNDLAGEN FUR DIE BEURTEILUNG DER WARMEBELASTUNGEN VON GEWASSERN).
Landerarbeitsgemeinschaft Wasser, Mainz (West Germany).
'Warmebelastund der Gewasser' Druckwerkstatten Koehler and Hennemann, Wiesbaden, Germany, October 1971, 84 p, 30 fig, 4 tab, append.

Descriptors: *Thermal pollution, *Heat budget, *Surface waters, Europe, *Water pollution effects, Forecasting, Water temperature, Temperature, Evaporation, Heated water, Seasonal, Meteorology, Rivers, Mixing, Dissolved oxygen, Water quality, Aquatic life, Water chemistry, Estuaries, Wastes, Thermal powerplants, Condensers, Cooling, Air temperature.
Identifiers: *Germany(Rhine River).

The book is subdivided into five chapters each dealing with a separate aspect of assessment of thermal pollution effects. The first chapters discuss natural and induced temperature fluctuations in flowing streams, lakes, estuaries and seas and in groundwater. Of these bodies of water the most threatened are fresh-water surface resources. The relationship between cooling requirements and natural water temperature is briefly discussed. Detrimental effects of heated discharges on the oxygen balance consist mainly of decreasing solubility of oxygen with increasing water temperature and increasing oxygen demand due to increased biochemical reaction rates. Effects on aquatic life of temperature and its variations are discussed from the standpoint of type of species and place of its occurrence. Influence of temperature on other water quality elements such as nitrogen balance, or corrosion properties are outlined. Further chapters deal with methods for estimation of such heat budget elements as influent and effluent temperatures in powerplant condensers, evaporation and radiation heat losses and gains, wind effects, mixing and convection factors, all taking into consideration the annual variation of meteorological conditions. Current and future thermal regimes in the Rhine River basin are presented based on developed predictive models and actual measurements. (Oleszkiewicz-Vanderbilt)

BIOASSAY PROCEDURES TO EVALUATE ACUTE TOXICITY OF NEUTRALIZED BLEACHED KRAFT PULP MILL EFFLUENT TO PACIFIC SALMON,
Fisheries Research Board of Canada, West Vancouver (British Columbia). Pacific Environment Inst.
J. C. Davis, and B. J. Mason.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1565-1573, October 1973. 4 fig, 4 tab, 21 ref.

Descriptors: *Bioassay, *Toxicity, *Sockeye salmon, *Pink salmon, *Pulp wastes, Industrial wastes, Pulp and paper industry, Mortality.
Identifiers: Bleached kraft pulp mill wastes, *Coho salmon, Survival, Data interpretation, Continuous flow system.

A series of bioassays was carried out to assess the acute toxicity of neutralized, filtered, bleached kraft pulp mill effluent (BKME) from a single mill to underyearling Pacific salmon in fresh soft water, at 10-13 C. Toxicity expressed in terms of the 96-hr LC50 varied from 22 percent of full strength BKME to nontoxic in different collections. A procedure is described for estimating the 4-day LC50 from geometric mean survival time data. Toxicity of effluents changed unpredictably with storage (even at 2 C), and declined with air stripping. Comparison of continuous flow and static test procedures indicated that continuous flow procedures yield somewhat higher toxicity results than static tests. Experiments with varying fish densities indicate that measurable toxicity is less in static tests with heavy fish loading. Use of loading densities of 2.5 liters/g fish or better is recommended. Young sockeye salmon (Oncorhynchus nerka) appeared most sensitive, and pink (O. gorbuscha) and coho (O. kisutch) salmon somewhat more resistant to toxic BKME solutions. No correlation was found between time to death and condition factor in the size range of underyearling coho tested (3.0-7.3 cm). Recommendations are made for routine and regulatory bioassay procedures. (Little-Battelle)

EFFECTS OF CADMIUM AND COPPER ON THE OXIDATION OF LACTATE BY RAINBOW TROUT (SALMO GAIRDNERT) GILLS,
Fisheries Research Board of Canada, West Vancouver (British Columbia). Vancouver Lab.
E. Bilinski, and R. E. E. Jonas.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1553-1558, October 1973. 3 fig, 4 tab, 22 ref.

Descriptors: *Bioassay, *Cadmium, *Copper, *Rainbow trout, *Oxidation, Animal physiology, Heavy metals, Toxicity, Water pollution effects, Mortality, Radioactivity techniques, Inhibition, Chemical analysis, Fish physiology.
Identifiers: *Lactates, Sample preparation, Histology, Gills, Biological samples, In vitro tests.

The purpose was to determine whether or not the exposure of rainbow trout to copper and cadmium salt solutions results in a significant inhibition of lactate oxidation in gills. Fish were exposed to 11.2-0.0112 mg/1 CdCl2 for 4-96 hr in fiberglass tanks. After exposure, fish were decapitated, the gill arches cut out, and gill filaments removed and weighed. The oxidative activity in gill filaments was determined by measuring the liberation of C-14-labeled CO2 from C-14-labeled Na-lactate-3-C. Gills were also analyzed for Cd and Cu content and examined histologically. At the highest Cd concentration (11.2 mg/1), fish died in 7 hr. At 1.12 mg Cd/1, fish mortality was 50 percent; of the fish surviving, oxidative activity was inhibited by 50 percent. All fish died in 24 hr when exposed to the highest level of copper (0.636 mg/1). At a concentration of 0.064 mg Cu/1, 50 percent of the fish died; of those surviving, oxidative activity was inhibited by 53 percent. Comparatively high levels of cadmium (20 micrograms) or copper (50 micrograms) were needed to produce in vitro inhibition of lactate oxidation by gill filament. The histological studies suggest that impairment of oxidative activity might be due to disruption of cellular organization or to inhibition of enzyme activity. The lactate oxidation test appears to be useful only at high levels of Cd and Cu, however it could be useful in detecting gill damage with other toxicants. (Little-Battelle)

HETEROTROPHIC UTILIZATION OF SUCROSE IN AN ARTIFICIALLY ENRICHED LAKE,
Manitoba Univ., Winnipeg. Dept. of Microbiology.
B. M. Thompson, and R. D. Hamilton.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1547-1552, October 1973. 3 fig, 18 ref.

Descriptors: *Eutrophication, Kinetics, Bioassay, Metabolism, Water pollution effects, Lakes, Carbon, Nitrogen, Phosphorus, Radioactivity techniques, Sampling, Aquatic microorganisms, *Path of pollutants, Photosynthesis, *Canada.
Identifiers: Substrate utilization, Biotransformation, *Sucrose, Fate of pollutants, *Organic carbon, *Heterotrophic bacteria, Particulate matter, Enrichment.

Lake 304 in the Canadian Shield area was enriched with C, N, and P as sucrose, ammonium chloride, and orthophosphoric acid to investigate the role of organic carbon in eutrophication. The investigation included study of the kinetics of sucrose transformation, comparison of particulate carbon produced by heterotrophic processes with that produced by algal photosynthesis and supplied by other sources, disappearance of sucrose immediately after enrichment using a laboratory experiment, and comparison of the uptake of glucose and sucrose in lakes 304 and 227. The lake was enriched with C-14-labeled sucrose at a rate of 5.54 g C/sq m/yr. Heterotrophic activity exhibited fluctuations representing the damped oscillations of a disturbed steady state system, stabilizing 3 months after the commencement of enrichment. By late summer, reduction of the weekly addition of sucrose to a few micrograms per liter was accomplished within a day by the increased microbial activity resulting from rapid growth of heterotrophic microorganisms. Heterotrophic conversion (preenrichment) of sucrose to particulate carbon in the epilimnion between July and October 1971 was 2-17 percent of primary production. 25-35 percent of total sucrose utilized was converted to carbon dioxide, the remainder being incorporated into particulate material or released as nonvolatile products of metabolism. (Little-Battelle)

A NUMERICAL MODEL FOR DETERMINING INTEGRAL PRIMARY PRODUCTION AND ITS APPLICATION TO LAKE MICHIGAN,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
E. J. Fee.

Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1447-1468, October 1973. 16 fig, 1 tab, 28 ref, 1 append.

Descriptors: *Primary productivity, *Lake Michigan, *Phytoplankton, *Light, *Mathematical models, *Carbon, *Computer programs, Statistical methods, Absorption, Data processing, Seasonal, Photosynthesis.
Identifiers: Accuracy.

A computer-based model for determining production by phytoplankton, integrated over depth and over an arbitrary time interval, is described. The solution incorporates light inhibition and uses the actual distribution of surface irradiance for the time interval of interest, since it is not possible to predict the detailed nature of cloudiness. Statistical procedures for estimating the model parameters from experimental data relating the rate of carbon uptake to irradiance are described. The model is applied to data collected from May 27, 1970 through February 3, 1971, from Lake Michigan. Integral primary production was bimodal at inshore and offshore stations with minimum production in midsummer and winter. There was great daily variability of integral production, due to variation of light. From this it inferred that occasional in situ measurements would give a very poor knowledge of true seasonal trends. The model output was verified by performing two in situ experiments. The agreement was better than 95 percent on both dates. The model makes it possible to estimate integral primary production on a routine basis in large water bodies with well-mixed photic zones. (Little-Battelle)

PRODUCTION OF EPILITHIPHYTON IN TWO LAKES OF THE EXPERIMENTAL LAKES AREA, NORTHWESTERN ONTARIO,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
D. W. Schindler, V. E. Frost, and R. V. Schmidt.
Journal of the Fisheries Research Board of Canada, Vol 30, No 10, p 1511-1524, October 1973. 10 fig, 2 tab, 27 ref.

Descriptors: *Gas chromatography, *Benthic flora, *Primary productivity, *Absorption, *Photosynthesis, *Carbon, Bioassay, Algae, Methodology, Seasonal, Mechanical equipment, Dissolved oxygen, Radioactivity techniques, Chlorophyll, *Canada, Lakes, Periphyton.
Identifiers: Scintillation counting, Substrates, Incubation chambers, Dissolved inorganic carbon, Sample preparation.

Two new techniques for measuring photosynthesis by benthic algal flora in waters low in dissolved inorganic carbon are described. The first uses gas chromatography to measure changes in DIC in incubation chambers directly. The second is a variation of the usual C-14 procedure, in which disappearance of C-14 from the water is measured by liquid scintillation instead of uptake of C-14 by the algae. This procedure is simpler than measuring the uptake of C-14, because digestion and/or combustion of samples is not necessary. Results are compared with the commonly employed C-14 uptake and O2 release techniques. Tests showed that heterogeneity of substrate was the major source of variation in in situ results, being large enough to make interpretation of seasonal effects and other causal factors extremely difficult. Annual production by epilithiphyton in two natural lakes in the Experimental Lakes Area (ELA) was 5.19 g C and 5.18 g C/sq m of substrate annually for lakes 239 and 240, respectively. These are the lowest values recorded for freshwater lakes at temperate latitudes. Because DIC and O2 concentrations could be measured simultaneously, it was possible to calculate photosynthetic quotients on several dates. These were extremely high, averaging 2.6 for the summer of 1971. (Little-Battelle)

Identifiers: Cryptophyta, Chroococcus, Oscillatoria, Pseudoanabaena, Lyngbya, Coleps, Spondylosium, Synedra, Dictyosphaerium, Oocystis, Ankistrodesmus, Chrysochromulina parva, Chromulina, Chrysococcus, Kepherion, Pseudokepherion, Botryococcus braunii, Dinobryon, Mallomonas pumilio, Staurastrum paradoxum, Staurastrum defectum, Staurastrum boreale, Sphaerozosma granulatum, Spondylosium planum, Chroococcus limneticus, Mallomonas elongatum, Mallomonas caudata, Mallomonas cf. intermedia.

Lake 227, a small lake with extremely low concentrations of dissolved inorganic carbon, was fertilized with PO4 and NO3 for 4 years, beginning in 1969. The additions increased natural inputs of phosphorus and nitrogen about five times. Phytoplankton standing crop increased nearly two orders of magnitude, and the Cryptophyceae and Chrysophyceae present in natural lakes of the area were replaced by Chlorophyta and Cyanophyta. The standing crop of phytoplankton per square meter was near the maximum which could theoretically be maintained by surface light, in spite of the low carbon concentrations. Added phosphate and nitrate were rapidly removed by phytoplankton, so that concentrations in the lake remained low. Almost all of the added nutrient was retained by the lake, in spite of relatively fast water renewal times. An average of 80 percent of the phosphorus income of the lake was sedimented. There was no return of phosphorus from sediments in spite of anoxic conditions in the hypolimnion. Photosynthesizing plankton reduced dissolved inorganic carbon concentrations severely, causing a flux of atmospheric CO2 into the lake. From 69 to 95 percent of the inorganic plus particulate carbon supplied to the lake was from the atmosphere. Results demonstrate that low carbon concentrations do not hinder eutrophication if phosphorus and nitrogen supplies are adequate. (Little-Battelle)

THE TRANSPORT OF ORGANIC CARBON TO ORGANISMS LIVING IN THE DEEP OCEANS,
Dalhousie Univ., Halifax (Nova Scotia). Inst. of Oceanography.
R. O. Fournier.
Proceedings of the Royal Society of Edinburgh, Section B (Biology), Vol 73, No 18, p 203-211, 1971-1972. 1 fig, 2 tab, 46 ref.

Descriptors: *Benthic fauna, *Distribution patterns, *Cycling nutrients, Nutrient requirements, Deep water, *Nutrients, Depth, Food chains, Oceans, Sampling, Theoretical analysis, Energy transfer, Deep-water habitats, Spatial distribution.
Identifiers: Transport, *Organic carbon, *Olive-green cells, Marine environment, Sample preparation.

Of the theories which have been proposed to explain the mechanism of organic carbon transport to its point of utilization in the deep ocean, none is adequately quantified to demonstrate its validity. A new mechanism is proposed based upon the occurrence of the so-called olive-green cells at various depths that suggests these cells may contribute up to 35 percent of the carbon requirements of the benthic fauna in the deep ocean. Quantitative data were obtained by collecting water with sterile or non-sterile samplers, filtering it through a membrane filter, and clearing and mounting the filter for microscopic examination. The cells are pigmented, possibly procaryotic organisms of uncertain identity. The cells were generally absent from the upper 50 m, increased in number from 50 m to a maximum at 300-500 m., and gradually decreased down to 400 m. The suggestion that these cells are the source of carbon for benthic organisms is based on three factors. First, the distribution of these cells varies directly with the level of surface productivity. Second, the negative gradient of the cell concentration below 300-500 m suggests that they are utilized throughout the water column. Third, other studies have identified similar cells in the guts of benthic and pelagic organisms. (Little-Battelle)

HORIZONTAL DISTRIBUTION OF SOME CHEMICAL AND PHYSICAL CHARACTERISTICS IN LIPNO RESERVOIR,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
Z. Brandl.
Hydrobiol Stud. 3. p 53-89, Illus, 1973.
Identifiers: Chemical constituents, *Czechoslovakia(Lipno reservoir), Distribution(Horizontal), Physical properties, Reservoirs, *Temperature, *Transparency, *Phosphorus, *Nitrogen.

Temperature, transparency and concentration of some chemical constituents in water were studied at various stations of the shallow, mostly non-stratified Lipno Reservoir (Czechoslovakia) and in some inflows during 1964-66. Slight increase in alkalinity and transparency and decrease of water color and the total P were found from the inflow to the dam. The dissolved and particulate Kjeldahl N had the most constant and the ammonia N the most variable distribution. The variation in nitrate concentration is originated due their more fast decrease at shallow stations. The separated Olsina bay and its inflowing creek differed markedly so that they may be considered as different water masses. The homogeneity of the remaining reservoir was high but different in different years: The variability of stations, was smaller in the years with shorter renewal time of water.—Copyright 1973, Biological Abstracts, Inc.

COMPARATIVE STUDY, IN 1966 AND 1967, OF THREE RESERVOIRS IN THE PROJECT OF A NATURAL PARK IN THE MORVAN REGION (IN FRENCH),
Institut National de la Recherche Agronomique, Thonon-les-Bains (France). Station d'Hydrobiologie Lacustre.
J. Feuillade, and M. Feuillade.
Ann Hydrobiol. 2(2): p 143-174, Illus, 1971, English summary.
Identifiers: *Algae, *Cyanophycea, Fishes, *France(Morvan region), *Microorganisms, Mixing, Oxygen, Parks, Physicochemistry, Recreation, Reservoirs, Sediments, Wind, *Productivity.

The physicochemistry and microbiology of 3 neighboring dammed lakes in France were studied. Settons reservoir is broad and shallow (6.50 m in the middle); water catchment is near the surface, and total water mixing is by wind. Its sediments are the most heterogeneous, thin and lying on a peat older than the lake itself. Crescent reservoir is deeply embanked, or irregular form; each of its 2

branches receives an effluent from the other lakes; it has a depth of 25 m at the station near the dam; there are 2 effluents, 1 above the upper part of the dam and the other at its base. O2 depletion occurs during summer with stagnation in the bottom. Its sediments are the finest and can retain much water; superficial sediments are the most reducing in late hot season. The greatest numbers of microorganisms occur during the warmest months. Chaumecon reservoir has a depth of 32 m at the dam base; the water catchment is at the base of the dam. The uppermost level is productive. There is no appearance of reducing power on the bottom and no diffusion of reduced matter towards the upper layers. Very strong oxidizing activity destroys organic matter. The fish productivity is best. Algal and microbial proulations differ from those of the other lakes. The differences in metabolism of the lakes are caused mainly by the location of the water catchments and by the level variations. A factor stimulating cyanophycean growth appears in Settons Reservoir. For recreational fishing, Crescent Reservoir, which favors aerobic life, is the least favorable.--Copyright 1973, Biological Abstracts, Inc.

RATIO OF ORGANIC CARBON WITH DIFFERENT TYPES OF OXIDIZABILITY IN THE OPEN WATER OF BAIKAL (IN RUSSIAN),
E. N. Tarasova.
Gidrobiol Zh. 8(5): p 70-75, Illus, 1972.
Identifiers: *Organic carbon, Seasonal, *USSR(Lake Baikal), *Oxidation.

The organic matter of Lake Baikal (USSR) was determined on the basis of the content of C and by means of oxidation of potassium bichromate in concentrated sulfuric acid and by potassium permanganate in an acidic medium. Data are given on the seasonal changes of the content of organic C, permanganate oxidizability in an acid medium, and bichromate oxidizability in the open waters of Baikal. The ratio of O2 of permanganate oxidizability to the O2 of bichromate oxidizability serves to some extent as a qualitative characteristic of organic matter.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

MANAGEMENT OF STORMWATER RUNOFF IN SUBURBAN ENVIRONMENTS,
Engineering-Science, Inc., Cincinnati, Ohio.
G. D. Beers.
Available from National Technical Information Service as PB-228 010 $4.50 in paper copy, $1.45 in microfiche. Project Completion Report, November 1973. 111 p, 45 fig, 20 tab, 24 ref. C-2079(3395)(1).

Descriptors: Precipitation(Atmospheric), Model studies, *Management, *Urban runoff, *Storm runoff, Suburban areas, Urban hydrology, Cities, Urbanization, *Water demand, *Water reuse, Water quality, Attitudes.
Identifiers: *Suburban watersheds.

The overall objective was to assess the feasibility of managing surface runoff from various suburban watersheds to meet suburban water demands. Definitive results were not anticipated from this study but, rather, a first-cut definition of an essentially uncharted area in suburban hydrology would be constituted. Although it appears technically possible to incorporate stormwater runoff into the suburban water resources arsenal, a number of key areas require additional information before the overall feasibility can be ascertained. First, information is needed on the current status of suburban social attitudes towards the re-use of stormwater and all that it implies. Second, it seems reasonable to expect that certain modifications could be made to suburban watershed surfaces, and in man's use of them, with resultant higher quality runoff flows from these watersheds.
W74-04302

COLOR REMOVAL FROM TEXTILE DYE WASTE BY COAGULATION,
Auburn Univ., Ala. Dept. of Civil Engineering.
J. F. Judkins, Jr.
Available from National Technical Information Service as PB-228 635 $4.25 in paper copy, $1.45 in microfiche. Completion Report, June 30, 1970, 23 p, 9 tab, 9 ref. OWRR A-011-ALA(1).

Descriptors: *Waste water treatment, *Coagulation, Color, *Coagulants, Dyes, Textiles, Industrial wastes, *Sulfates, Biochemical oxygen demand.
Identifiers: *Color removal, *Textile dye wastes, *Alum coagulation, Ferric sulfate.

The purpose was to determine if color removal by coagulation could be made more economical by optimizing the coagulant dosage and pH range for the treatment of a waste. Two coagulants, ferric sulfate and aluminum sulfate were compared as to their relative costs and coagulating power for the treatment of sulfur and vat dye waste and of a mixture of vat and sulfur dye waste. The possibility of reducing the coagulant dosage by using a synthetic polymer as a coagulant aid was also investigated. In addition to color removal, reductions in BOD of the waste as a result of coagulation were studied. This research investigated color removal from concentrated dye waste samples only; samples were collected from a sewer which received the discharge from the dyeing machine at a local textile mill. The following conclusions were made: Coagulation with alum following pH adjustment was the most efficient of the methods investigated for removing color from sulfur dye waste. Hydrogen sulfide gas production becomes a problem in treating sulfur dye waste with pH values of 4.0 and below. The use of Separan coagulant aids is not justified. It is difficult to remove color from vat dye waste with any of the coagulants investigated. Ferric sulfate appears to be the coagulant of choice for treating 50% vat - 50% sulfur dye mixture if a final pH of 11.2 can be tolerated. Treatment of a 50% vat - 50% sulfur dye waste at pH 7.0 can be accomplished most economically with alum. Some BOD removal results from decolorizing dye waste.
W74-04303

SOCIAL, ECONOMIC, ENVIRONMENTAL, AND TECHNICAL FACTORS INFLUENCING WATER REUSE,
Utah Center for Water Resources Research, Logan.
A. B. Bishop, S. Pratishthananda, J. Keith, C. Colton, and A. B. Crawford.
Available from National Technical Information Service as PB-228 146 $3.25 in paper copy, $1.45 in microfiche. Utah Water Research Laboratory Publication PRJERO25-1, December 1973. 40 p, 13 fig, 3 tab, 147 ref. OWRR A-016-UTAH(1). 14-31-0001-3845.

Descriptors: *Reclaimed water, *Water reuse, *Recycling, *Impaired water use, *Social aspects, Social change, *Economic efficiency, Treatment, Legal aspects, *Environmental control.

The potential for wastewater salvage and reuse in a region is described in terms of the systems relations among the social and economic parameters affecting reuse of water and the environmental and technological aspects of wastewater disposal or salvage. Components of the hydrologic system are abstracted in network flow diagram which shows the water supply sources that are influent to water using activities (municipal, industrial, agricultural, fish and wildlife, and recreation) and the discharge of effluents from these activities. This framework is used to identify mechanisms--technological, economic, social, legal, and environmental--that will control or influence water reuse. Analyses include: (1) Technological--treatment and salvage/reuse technologies needed to upgrade water quality for reuse; recycling process water as related to places for application in the system, (2) Economic--influence of economic market mechanisms on reuse; implementation of various economic measures in promoting or discouraging reuse (e.g. incentive payments, taxes, penalties), (3) Social--assessment of attitudes, interests and norms of individuals and groups that affect reuse of water; sources of resistance to change and determination of social change necessary for acceptance of water reuse, (4) Legal--laws affecting the possibility of water reuse such as water rights, water management institutions, and water quality legislation, (5) Environmental--physical and biological considerations in the environment affecting reuse.

WATER SUPPLY AND WASTE DISPOSAL CONCEPTS APPLICABLE IN PERMAFROST REGIONS,
Alaska State Dept. of Environmental Conservation, Fairbanks.
A. J. Alter.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 577-581, 1973. 1 fig, 2 tab, 1 ref.

Descriptors: *Water supply, *Waste water disposal, *Waste water treatment, *Cold regions, *Arctic, Permafrost, Surveys, Conferences, Environmental engineering.

At permafrost and cold-dominated sites, water supply and waste disposal systems are especially subject to damage from freezing. Such damage may impair site, processes, and facilities. Several different concepts have been used to reduce the risk of damage. Current technology is adequate to insulate, heat, enclose, monitor, and otherwise provide protection. Dependability as well as costs for heat-sensitive systems present serious problems. Temperate climate concepts require input of heat energy. They are highly susceptible to failure under cold stress. Large imports of fuel to meet the energy needs of conventional systems are unrealistic on a long-term basis. Radical departure from current practice is indicated if costs are to be reduced significantly and dependability enhanced. Concepts that utilize low temperature or are unaffected by it should be investigated further. Imported energy must be conserved, and cold itself must be exploited as a resource to effectively and efficiently meet demand for water supply and waste disposal service and at the same time maintain environmental excellence on a long-term basis. A SEWAGE-TREATMENT CONCEPT FOR PERMAFROST AREAS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
S. C. Reed, and T. D. Buzzell.

In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 706-712, 1973. 1 fig, 2 tab, 10 ref.

Descriptors: *Sewage treatment, *Permafrost, Aeration, Waste treatment, *Waste water treatment, Water temperature, *Construction costs.

A sewage treatment concept was developed for permafrost areas. It is compatible with the permafrost environment and still offers substantial savings in construction costs. The concept adopts the passive approach to construction in permafrost by protecting the supporting material from thermal stress. The unit is designed to be placed above ground on a gravel pad with the tank slightly elevated on cribbing to permit free air flow underneath. This configuration protects the underlying permafrost from thermal degradation but exposes the tank bottom to the low winter temperatures. A number of protective features are included to prevent freezing of tank contents. The key element is utilization of a floating tube settler, which provides the essential final clarification of the effluent prior to discharge. The compact nature of this settler permits installation directly in the aeration tank, thus avoiding the need and costs for separate clarifier tankage. The resulting single-tank-treatment system provides significant thermal and economic advantages for utilization in the permafrost regions of the world. (See also W74-04346) (Knapp-USGS)

INDUSTRY AWAITS SOLUTIONS TO PROBLEMS OF HIGH-LEVEL RADIOACTIVE-WASTE MANAGEMENT,
S. D. Strauss.
Issue available from POWER, McGraw, Hill, Inc., Pub., Concord, N.H., Single copy $2.00. Power, Vol 117, No 12, p 23-27, Dec. 1973. 12 fig.

Descriptors: *Radioactive waste disposal, *Nuclear powerplants, Effluents, Gas, Liquid, Air pollution, Water pollution, Water pollution sources, Treatment, Treatment facilities, Waste disposal, Geology, *Waste water treatment.
Identifiers: *Fuel reprocessing, *Waste storage, *Waste solidification, Salt disposal, Retrievable surface storage, Storage containers.

Long-term disposal of high-level radioactive wastes remains one of the unresolved aspects of the nuclear fuel cycle. Most likely possibility is storage in solid form in extremely stable geologic formations. Underground salt beds, under investigation for some time, appear likely to offer safe and stable storage for millions of years. Project Salt Vault, a 19-month study by Oak Ridge, was made to determine feasibility. Any of a number of salt deposits in U.S. can be used if the technique proves acceptable. One method of solidifying high-level liquid radioactive waste is by a calcining process that converts it into granular form, reducing volume approximately 90%. Solids are accumulated in storage bins. Since 1963, AEC has calcined its radioactive liquid high-level waste and stored it in bins 40-60 ft high x 12 ft in diameter, 7 bins to each underground concrete tank. The bins and tanks in this storage setup are designed to last at least 500 years. Temporary facilities, termed Retrievable Surface Storage, will be provided for high-level solid wastes from commercial reprocessing plants. AEC announced last year a program to design and construct a surface or near-surface facility, first module to be ready in time for receipt of the first shipments expected - some time in 1983-4. Others will be added as needed. (Houser-ORNL)

AN ASSESSMENT OF THE USE OF POTOMAC ESTUARY WATERS AND AWT EFFLUENTS FOR EMERGENCY WATER SUPPLY,
Meta Systems, Inc., Springfield, Va.
G. K. Young, and R. C. Palange.
Water Resources Research Center, Washington Technical Institute. Project Report No. 1. October 1973. 33 p, 5 tab, 34 ref.

Descriptors: *Water reuse, *Waste water treatment, *Water quality standards, Recycling, Water supply, Waste water, Disinfection, Toxicity, Public health, *Potomac River, *District of Columbia, Estuaries.
Identifiers: *Indirect reuse.

Recognizing the resistance to building upstream reservoirs for water supply for the Washington, D.C. area, this study looks at the alternative of waste water reuse including the use of the Potomac estuary. Previous experience with waste water reuse, professional and public opinion as to its acceptability, requirements and guidelines for domestic use of waste water, the health hazards involved, and the identification of operating procedures and precautions for processing waste water for reuse are examined. Examples of reuse include Chanute, Kansas, Santee, California, and Philadelphia. Most examples of reuse involve indirect reuse of waste water which includes natural processes in addition to treatment. Indirect reuse is more acceptable than direct reuse both in terms of public health requirements and public attitudes. Five basic issues are emphasized: disinfection of the waste water to remove viruses; the problem of long-term chronic toxicity; the reliability of the treatment processes, particularly waste water treatment; indirect reuse versus direct reuse; and public attitudes. Recommendations include: fail-safe procedures should be developed using an experimental pilot plant; an up-to-date inventory of industrial wastes should be made; investigate experiences of reuse in U.S., South Africa and U.S.S.R.; determine hydrodynamic and biologic attributes of Potomac estuary; develop criteria for limits for finished waters derived from waste water contaminated sources; and structure a public relations program. (Elfers-North Carolina)

SYRACUSE METROPOLITAN AREA COMPREHENSIVE PLAN-WATER AND SEWER PLAN AND SERVICES ALLOCATION PLAN,
Syracuse-Onondaga County Planning Agency, N.Y.
C. T. Ladd, and J. A. Martin.
Available from the National Technical Information Service as PB-219 042, $5.75 in paper copy, $1.45 in microfiche. Prepared for Central New York Regional Planning and Development Board, October 1972. 68 p, 1 map, 10 tab. NYP-246.

Descriptors: *Water supply, *Water demand, *Sewerage, *Utilities, *Comprehensive planning, Land use, Financing, Costs, Environmental effects, Coordination, Water quality, Inter-agency cooperation, Equity, *New York.
Identifiers: *Disparities, Utility extension, Syracuse(N.Y.), Equitable apportionment.

Several policies are recommended in this development plan which seeks to establish efficient and equitable water and sewer services. Environmental pollution would be alleviated by upgrading existing public works systems and by providing necessary facilities to already developed neighborhoods. Capacities of new public facilities should be designed to be incremental whenever possible. Additional population growth would be accommodated first within the existing and programmed sanitary districts. As optimal levels of development are approached, preparation for new demands within satellite systems would be made. The establishment of public sewer and water districts within preservation districts areas would be discouraged. Tax disparities should be eliminated for identical services, and the beneficiaries of new systems and facilities should pay their full share of development, operating, and maintenance costs. A coordinated capital improvements program for all local governments would be established. Scope of services, operation, administration and revenue sources of the present system, plus anticipated future needs are discussed. (Edwards-North Carolina)

PRATTVILLE, ALABAMA COMMUNITY DEVELOPMENT PLAN, VOL. II: SUMMARY AND ILLUSTRATIONS.
Central Alabama Regional Planning and Development Commission, Montgomery.
Report No. ALA-CAP-1415-1020-03. June 1973. 54 p, 42 fig, 3 tab. ALA-RX09-1020-0.

Descriptors: *Planning, *Water supply, *Sewerage, *Water demand, *Utilities, *Alabama, Financing, Costs, Water quality, Urban land use, Environmental effects, Drainage, Design, Timing, Scheduling, Investment.
Identifiers: Utility extension, Prattville(Ala), Urban growth, Alabama River.

Major features identified as a part of the Community Utility Plans are: all areas proposed for urban development to be serviced with public water and sewer; all extensions of water and sewer lines are planned to guide the location and density of development; water supply and pressure is to be designed for maximum domestic use plus maximum fire fighting needs; equity of distribution (supply and pressure) is to be achieved through minimum line diameter of 6 inches, through the locations of wells and storage facilities, and looping to reduce dead-end lines; sewer lines are designed for capacity growth utilizing a system of trunk lines and laterals; and drainage improvements are proposed to protect natural drainageways and to handle storm runoff from capacity development. Current estimates indicate the supply of water from wells will be sufficient to serve the future population. The sewer system in Prattville's most acute problem. Sewage treatment plant has inadequate capacity. Numerous breaks produce sewage flows into creeks. Relocation of the plant, construction of a second one, repair of lines, and installation of trunk lines to serve new development will all be necessary. Drainage is not a major problem, although some local improvements are needed. Steps should be taken to preserve natural drainageways. Erosion in some places has produced difficulties. Expenditures on community utilities are included in the proposed capital im-

provements budget for the period 1974 to 1980. (Edwards-North Carolina)

COLOR OF PULP INDUSTRY WASTE LIQUORS. III. THE INTERACTION OF CHLORO-OXYLIGNIN WITH METAL SALTS (IN JAPANESE),
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture.
K. Sameshima, M. Sumimoto, and T. Kondo.
Mokuzai Gakkaishi (Journal of the Japan Wood Research Society), Vol 19, No 3, p 125-130, March 1973. 10 fig, 1 tab, 10 ref. English summary.

Descriptors: *Color, *Pulp wastes, *Bleaching wastes, *Waste water treatment, *Lignins, *Cations, Additives, Chemicals, Inorganic compounds, Nitrates, Water pollution sources, Waste treatment, Industrial wastes, Pulp and paper industry, Hydrogen ion concentration, Foreign research.
Identifiers: Chlorine compounds, Kraft mills, Chromophores, Thiolignin, Chlorolignin, Lignosulfonic acids, Japan.

Attempts to remove color from bleached kraft pulp mill effluents must focus on chlorinated oxidized lignin as the major chromophoric constituent in such wastes. Among 16 different metal nitrates examined for decoloring efficiency, trivalent cations were found to be superior to divalent ones and much superior to monovalent ones. The most effective cations were Fe(III), Al, Cr(III), and Pb(II). Since their action on chloro-oxylignin decreased greatly at alkaline pH, waste water treatments should preferably be conducted in the acidic range. Among different lignin-bearing wastes, oxylignin solutions were more readily decolored than lignosulfonic acid solutions, but slightly less readily than thiolignin solutions. (Brown-IPC)

ASPECTS OF COLOUR REMOVAL FROM PULP AND PAPER MILL EFFLUENTS,
Central Public Health Engineering Research Inst., Nagpur (India).
P. V. R. Subrahmanyam, P. C. Sachan, and G. J. Mohanrao.
IPPTA (Journal of the Indian Pulp and Paper Technical Association), Vol 9, No 1, p 20-23, January-March 1972. 2 tab, 12 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Lignins, *Color, Effluents, Soil chemical properties, *Ion exchange, *Cation adsorption, Adsorption, Waste water(Irrigation), Irrigation, Land use, Soil disposal fields, Filtration, Percolation.

Lignin is not only an esthetically offensive, but also a difficultly biodegradable pollutant. Effluent color caused by lignin can be removed by chemical methods, such as massive lime dosage, biological methods, such as activated sludge treatment and fungal degradation, and physical methods, such as adsorption on activated carbons or soils. Eight different soils were investigated for color-removing capacity. Laboratory results showed that color reduction was proportional to the cation-exchange capacity of the soils. The amount of land area required for pulp mill effluent treatment by this method is calculated, assuming steady percolation and evaporation rates. (Wise-IPC)

WATER REUSE AND DEPOSITS CONTROL,
Buckman Labs., Inc., Memphis, Tenn.
S. J. Buckman.
Southern Pulp and Paper Manufacturer, Vol 36, No 4, p 17-20, 22, April 1973. 1 fig.

Descriptors: *Water reuse, *Pulp and paper industry, *Operation and maintenance, Equipment, Maintenance, *Corrosion, *Slime, Effluents, Industrial water, Water conservation, Water circulation, Instrumentation, Measurement, *Recycling.
Identifiers: Paper mills, Board mills, Downtime, Production losses, Mill management, Deposits(Scale and slime).

Although the recycling of process waters is the best approach to the reduction of effluent volumes in pulp and paper mills, increased reuse of water requires improved measures for controlling deposits of a microbiological nature, such as slime growths, and of nonbiological deposits, such as scales. The results of such deposits can be disastrous losses in production (due to machinery downtimes); losses in heat, fibrous and chemical raw materials, such as fillers; reduced life of paper machine felts and wires; and reduced product quality. A factory-wide deposits-control program should receive sustained attention from mill management. Practical evaluation and graphic presentation of results are part of the program, as are measuring instruments to obtain the data needed. The construction of a slime-measuring unit is illustrated. EFFECTS OF CONDENSATES ON THE TOXICITY OF KRAFT PULP MILL EFFLUENTS,
B.C. Research Ltd., Vancouver.
A. Bruynesteyn, and C. C. Walden.
Pulp and Ppaer Magazine of Canada, Vol 74, No 7, p 84-89 (Technical Paper T226), July 1973. 3 fig, 8 tab, 3 ref.

Descriptors: *Toxicity, *Pulp wastes, *Bleaching wastes, Effluents, *Resins, *Evaporators, Waste water(Pollution), *Water reuse, Water pollution sources, Evaporation, Pulp and paper industry, Industrial wastes.
Identifiers: Wash waters, Pulp washing, Kraft pulp, Condensates(Evaporator), Resin acids, Wood extractives, Kraft mills, Bleach plants, Washers(Equipment).

The reuse of evaporator condensates as wash water for brown stock (unbleached kraft pulp) was shown to increase the resin acid content of the washer effluent and its toxicity. Both drum and diffuser washers were evaluated. Although the wood species used in a pulp mill, as well as the carryover of adsorbed toxicants into the bleach plant, are factors in effluent toxicity, it should become possible to operate multiple-effect evaporators without producing toxic condensates. (Brown-IPC)

WILLAMETTE CLEANUP,
S. Pollitzer.
Pulp and Paper, Vol 47, No 3, p 51-55, March1973. 12 illus.

Descriptors: Water quality control, *Stream improvement, Rivers, *Oregon, *Pulp wastes, *Waste water treatment, Treatment facilities, Pulp and paper industry, Sulfite liquors, Industrial wastes, Waste treatment, Costs, Capital costs, Water quality standards, Law enforcement, Regulation, Fish, Recreation, Water sports, Biological treatment.
Identifiers: *Willamette River(Oregon), Sulfite mills, Chemical recovery, Spent sulfite liquors, Spent pulping liquors.

In 1972, the Willamette River (Oregon) became the first major U.S. waterway which received industrial wastes that had all undergone secondary treatment. This massive stream improvement effort involved 9 pulp and paper mills along the river and its tributaries. Although most of these mills possessed primary treatment facilities, they had to construct chemical recovery and secondary treatment systems totaling over $40 million. One sulfite mill closed down, another installed a chemical recovery system for ammonium-base spent sulfite liquor, and two mills converted to the magnesium-base sulfite pulping process. As a result of the total cleanup program, waste discharges into the river were reduced by 90%, the overall water quality was raised to meet strict federal and state standards, the number of migratory game fish was increased, and the sportive use of the water course

ws made safer and more enjoyable. A list of all mills affected by the program is included, detailing new effluent treatment facilities and their costs. (Witt-IPC)

A NEW SECONDARY TREATMENT.
Paper Trade Journal, Vol 157, No 19, p 46, May 7, 1973.

Descriptors: Biological treatment, *Waste water treatment, *Pulp wastes, *Biodegradation, *Treatment facilities, Equipment, Microorganisms, Pollutants, Oxidation, Industrial wastes, Waste treatment, Pulp and paper industry, Costs, Operating costs, Settling velocity, Sedimentation rates.

'Bio-Surf' is a pollution-control process developed by Autotrol Corp. that may reduce the costs of secondary waste treatment. The process was recently adapted to the needs of the pulp and paper industry. It utilizes a series of large plastic disks mounted and rotating on a horizontal shaft while partly immersed in the waste water. Biological growth forming on the disk surfaces performs natural oxidation of pollutants, producing carbon dioxide, water and additional microbial cells. The sludge produced has excellent settling properties. The system is said to adjust rapidly to changes in flow volume and pollutant concentration. (Witt-IPC)
W74-04524

EXTENSIVE EFFLUENT TREATMENT AT HODGE INCLUDES COLOR REMOVAL.
Paper Trade Journal, Vol 157, No 18, p39-40, April 30, 1973. 1 illus.

Descriptors: *Waste water treatment, *Louisiana, *Chemical precipitation, *Lime, *Color, *Pulp wastes, Sludge treatment, Sludge disposal, Incineration, Carbon dioxide, Calcium carbonate, Effluents, Pulp and paper industry, Air pollution, Hydrogen ion concentration, Dissolved solids, Suspended solids.
Identifiers: Chemical recovery, Lime kilns, Carbonation, Clarifiers, Flue gases, Hodge(La).

A novel feature of the environmental protection facilities at the recently expanded pulp and paper mill of Continental Can Co. in Hodge, La., is an effluent decoloring system, in which lime is added to the waste waters entering the first clarifier stage. Sludge from this primary clarifier, including precipitated color bodies, is incinerated in the mill's lime kiln for recovery of lime. Dissolved lime remaining in the clarified effluent is recovered by treatment with lime kiln stack gases which provide the carbon dioxide needed to precipitate dissolved lime as Ca carbonate. The pH of the clarifier effluent is adjusted before it enters the oxidation ponds for secondary treatment. Air pollution abatement facilities at the mill are also described. (Witt-IPC)
W74-04525

FINLAND STARTS PRODUCTION OF PROTEIN FROM BLACK LIQUOR.

Descriptors: *Pulp wastes, *Byproducts, *Proteins, *Waste treatment, Feeds, Carbohydrates, *Fermentation, Foreign research, Europe, Pulp and paper industry, Industrial wastes.
Identifiers: Pekilo protein, *Finland.

'Pekilo' protein is produced from the spent sulfite pulping liquor fermentation by fungi. The process is also applicable to the carbohydrate wastes of other industries. It can be licensed from SITV, a consortium of major Finnish pulp and paper companies. The product is an odorless cream-colored powder or granule which has undergone rigorous animal feeding tests. Initial production at United Paper Mills Ltd. in Jamsankoski will be ca. 10,000 tons in 1974. (McClenahan-IPC)

POLLUTANT REMOVAL HANDBOOK,
M. Sittig.
Noyes Data Corp., Park Ridge, New Jersey (and London, England) 1973. 528 p, Price: $36.00.

Descriptors: *Pollution abatement, Pollutants, *Chemicals, *Reviews, *Waste treatment, *Waste water treatment, *Air pollution, Water pollution treatment, Waste water(Pollution), Industrial wastes, Chemical industry, Pulp and paper industry, Effluents.

This compilation, based on a review of various cited literature sources, explains available techniques for the removal of chemical pollutants from water and air. About 130 different polluting chemicals are covered, ranging from acids to zinc, and including some materials found in pulp and paper mill effluents, such as chlorine, dyestuffs, flyash, formaldehyde, and sulfur dioxide. (Brown-IPC)
W74-04527

CLARIFICATION METHOD OF POLLUTED WATER FROM PAPER MILLS WITH COMBINATION OF BEER EFFLUENT (IN JAPANESE),
Washington Univ., Seattle. Coll. of Forest Resources.
K. Akagane, and G. G. Allan.
Japan Tappi, Vol 27, No 7, p 341-347, July 1973. 9 fig, 5 tab, 5 ref (English summary).

Descriptors: Water pollution sources, Water pollution treatment, *Pulp wastes, *Industrial wastes, *Food processing industry, *Waste water treatment, *Chemical precipitation, Settling velocity, Pulp and paper industry, Chemical industry, Proteins, Lignins, Phenols, Carbohydrates, Herbicides, Clays, Sulfonates.
Identifiers: *Breweries, Beer effluents, Alum(Aluminum potassium sulfate), Aluminum compounds, Hemicelluloses, Lignosulfonates, Alkali lignin.

The major components of paper mill effluents include hemicelluloses, fine fibers, and polyphenolic compounds, such as lignosulfonates and kraft (sulfate-process) lignin, whereas waste waters discharged by beer factories contain largely proteins. Joint treatment of paper mill plus beer factory wastes with 1% alum produced a large volume of precipitate, whereas this amount of alum had no effect on paper mill effluent alone. Settling of pollutants was accelerated by the presence of colloidal clay. The precipitated sediments might find commercial use as carriers for controlled-release herbicides. They could also be reused as paperboard filler. (Brown-IPC)
W74-04528

APPLICATION OF POLYACRYLAMIDE TO PULP MILL EFFLUENTS (IN JAPANESE),
Hokuetsu Paper Mills Co., Ltd., Nagaoka (Japan). Research Lab.
M. Sakuma, M. Kimura, and O. Takahashi.
Japan Tappi, Vol 27, No 6, p 283-288, June 1973. 10 fig, 3 tab, 5 ref. (English summary).

Descriptors: *Pulp wastes, *Bleaching wastes, *Waste water treatment, Sedimentation rates, *Coagulation, Suspended solids, Additives, *Chemcontrol, Hydrogen ion concentration, Polymers, Organic compounds, Inorganic compounds, Chemicals, Settling velocity, Industrial wastes, Pulp and paper industry, Waste treatment, Chemical oxygen demand, Surfactants.
Identifiers: Alum(Aluminum-potassium sulfate), *Polyacrylonitrile, Kraft mills, Molecular weight, Macromolecules, Coagulants, Aluminum compounds.

In the purification of effluents from bleached kraft pulp mills by addition of polyacrylamide (PAA) as a coagulant aid, studies were conducted on the appropriate alum dosage, the effects of PAA molecular weight and dose rate, and the effects of pH on coagulation efficiency. The removal of COD loading was found to depend on the alum dosage, but not on the PAA dosage. The function of PAA is seen in strong coagulation and rapid sedimentation of suspended solids. For satisfactory coagulation, the PAA preparation should have a molceular weight above 5 million. The settling rate increased with increased PAA dosage. Non-ionic PAA produced the fastest sedimentation at pH 5-7, whereas anionic PAA exerted the most rapid effect at pH 8, regardless of its degree of hydrolysis. (Brown-IPC)
W74-04529

LOW COST METHODS FOR TREATING PULP AND PAPER MILL EFFLUENTS,
Central Public Health Engineering Research Inst., Nagpur (India).
P. V. R. Subrahmanyam, R. C. Parekh, and G. J. Mohanrao.
IPPTA (Journal of the Indian Pulp and Paper Technical Association), Vol 9, No 1, p 14-19, January-March 1972. 6 fig, 2 tab, 18 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Water pollution treatment, *Pollution abatement, Pulp and paper industry, Oxidation, Biochemical oxygen demand, Aerated lagoons, Lagoons, Anaerobic digestion, Nutrients, Economic efficiency, Costs, *Operating costs.
Identifiers: *India.

The theory, mechanism, and suitability of four low-cost effluent treatment methods for application to pulp and paper mill discharges in India are discussed, namely, the oxidation pond, the oxidation ditch, and the aerated and anaerobic lagoon. Pilot-plant studies with nutrient addition to an anaerobic lagoon indicated BOD reductions for pulp mill effluents of 67% in summer and 50% in winter. Without nutrient addition, the same reductions required a doubling of retention time, but were considerably cheaper. Laboratory and pilot-plant studies with an aerated lagoon achieved BOD reductions of 15-20 mg per liter in 3 days. They indicated also that strong (highly polluted) wastes should be segregated and treated anaerobically in a preliminary stage. (Wise-IPC)
W74-04531

HYDROGEN PEROXIDE FOR INDUSTRIAL POLLUTION CONTROL,
FMC Corp., Princeton, N.J. Research and Development Dept.
W. H. Kibbel, Jr., C. W. Raleigh, and J. A. Shepherd.
Industrial Wastes, Vol 18, No 6, p 41-45, Nov/Dec 1972. 2 fig, 6 tab, 16 ref.

Descriptors: *Oxidation, *Oxides, Pollution abatement, *Sulfur compounds, *Industrial wastes, *Chemcontrol, Water pollution treatment, *Waste water treatment, *Phenols, Effluents, Chemical industry, Pulp and paper industry, Fuels, Textiles, Plastics, Sulfides, Inorganic compounds, Organic compounds, Chemicals.
Identifiers: *Cyanides, Hydrogen peroxide, Oxidants, Viscose rayon.

Among the commercial or commercially feasible applications of hydrogen peroxide in pollution control are the removal of sulfur compounds (such as sulfides, mercaptans, and sulfur dioxide) from waste products of the mining, fuel (coke, natural gas, and petroleum), viscose rayon, and kraft pulping industries; the detoxification of cyanides; and the elimination of phenolic compounds from effluent streams of the chemical and plastics industries. These and related applications are described. (Witt-IPC)
W74-04532

GRAVITY DEWATERING: APPLICATION TO PAPER MILL WASTES,
Permutit Co., Paramus, N.J.
W. L. Schwoyer.
Industrial Wastes, Vol 18, No 2, p 18-23, March/April 1972. 6 fig, 1 tab, 2 ref.

Descriptors: *Filters, *Dewatering, *Sludge treatment, Treatment facilities, Suspended solids, *Pulp wastes, *Filtration, *Waste water treatment, Operation and maintenance, Equipment, Fibers(Plant), Industrial wastes, Waste treatment, Pulp and paper industry, Particle shape, Particle size.
Identifiers: Concentrating(Dewatering), Gravity filters, Thickeners(Machinery), White water, Screw presses, Roller presses.

Mechanical gravity dewatering followed by secondary dewatering in a press is discussed as a means for concentrating paper mill effluents, such as white waters. Dewatering devices employing gravitational force require little power input and maintenance. They produce a clean filtrate, since small particles are not readily pulled from the inside of the forming filter cake. Gravity thickeners can also handle fragile and gelatinous particles without being clogged by them, and are operational over a wide range of influent solids concentrations. Several such thickeners are described. Chemical conditioning treatments for waste streams in order to reduce their drainage time are also discussed. Screw presses are used for secondary dewatering of sludges that contain long fibers, whereas multiroller presses are more suited for sludges relatively free of long fibers. (Witt-IPC)
W74-04533

PAPERMILL TREATMENT PLANT FOR SMALL INDUSTRY.
Industrial Wastes, Vol 18, No 2, p 16-17, March/April 1972. 2 fig.

Descriptors: *Pulp wastes, *Waste water treatment, Treatment facilities, *Coagulation, *Filtration, *Massachusetts, *Connecticut river, New England, Industrial wastes, Waste treatment, Pulp and paper industry, Mixing, Suspended solids, Sewage treatment, Water quality control, Pollution abatement, Effluents, Waste water(Pollution), Filters, Costs, Capital costs.
Identifiers: Microstrainers, Paper mills, Small enterprises.

Strathmore Paper Co. (West Springfield, Mass.) and Esleeck Manufacturing Co. (another paper mill in Turners Falls, Mass.) are jointly using a relatively economical waste treatment facility for removal of effluent suspended solids. The $850,000 project, built after a pilot-plant study, was partly funded by a federal grant and may point the way to survival of other small paper enterprises faced with 'stop pollution or shut down' orders. Effluents from the two mills are mixed, then treated jointly with a chemical coagulant, and passed through two 10-ft rotary microstrainers before being discharged into the Connecticut River. Solids retained by the strainers are pumped for further treatment to the City of Montague's municipal sewage system. (Witt-IPC)
W74-04534

BOISE CASCADE PAPER MILL AND ST. HELENS SHARE TREATMENT LAGOON.
Industrial Wastes, Vol 18, No 2, p 14-15, March/April 1972. 2 illus.

Descriptors: *Lagoons, *Waste water treatment, *Pulp wastes, Treatment facilities, *Sewage treatment, *Columbia River, *Oregon, Pulp and paper industry, Biochemical oxygen demand, Waste treatment, Industrial wastes, Waste water(Pollution), Aerated lagoons, Anaerobic digestion, Aeration, Pollution abatement, Pipelines.
Identifiers: Paper mills.

The pulp and paper mill of Boise Cascade Corp. at St. Helens, Oregon, recently started secondary treatment of waste waters in a new city-owned 40-acre holding lagoon. The jointly financed, aerobic-anaerobic (facultative) basin also serves for secondary treatment of the city's sewage. The $2.6 million facility can remove 85% of a daily BOD input of 55,000 lb before discharging treated wastes into the Columbia River through a concrete outfall pipe about 30 ft below the stream's summer water level. (Witt-IPC)

CATALYTIC OXIDATION AND THERMAL TREATMENT OF WASTE WATERS (KATALITICHESKOE OKISLENIE I TERMICHESKOE OBEZVREZHIVANIE STOCHNYKH VOD),
Gorkovskii Zavod Orgsintez (USSR).
S. P. Medvedev.
Gidroliznaya i Lesokhimicheskaya Promyshlennost', No 3, p 28-29, 1973. 1 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial water, Cooling water, *Oxidation, Catalysts, *Chemical wastes, Treatment facilities, Pollution abatement, Waste water(Pollution), *Incineration, Burning, Chemical oxygen demand, Resins, Carbon dioxide, Steam, Evaporators, Organic loading, Inorganic compounds, Organic compounds, Chemicals, Chemical reactions, *Recycling.
Identifiers: Rosin, Turpentine, Silvichemicals, Naval stores, Furnaces, Chemical reactors, Lacquers, Camphor.

Effluents from the processing of pinewood oleoresin to obtain naval stores (rosin and turpentine), and from the conversion of turpentine into camphor, oxyterpene resins, and related silvichemicals, are heavily polluted and contain up to 70,000 mg of COD/liter. Rosin and camphor factory effluent (75% by volume) is less polluted, but waste waters from the manufacture of nitro lacquers (25% by volume) have COD values up to 128,000 mg/liter. Direct and indirect incineration of these effluents in a gas-fueled cyclone combustion chamber produces carbon dioxide and steam which are cooled from 900-100 to 150-250 C in a vertical furnace where they serve to heat evaporator steam and burner air. The heated steam is passed to a reactor where its organic content is oxidized in contact with a catalyst. The purified steam can be recycled. Mineral impurities melted in the burner are collected separately. Cooling water in the entire factory amount to 95-98% of its total freshwater consumption and is discharged without purification. Based on operating experience with the experimental effluent-treatment facilities, several suggestions for their improvement are presented. (Stapinski-IPC)
W74-04537

STUDY OF PULP AND PAPER INDUSTRY'S EFFLUENT TREATMENT.
EKONO, Helsinki (Finland).
Report prepared for United States Federal Agriculture Organization Advisory Committee on Pulp and Paper, 13th Session, Rome, 15-16 May 1972. 74 p, 23 tab, 43 fig, 47 ref.

Descriptors: *Pulp wastes, *Bleaching wastes, *Waste water treatment, Costs, Economic feasibility, *Treatment facilities, Economic efficiency, *Econometrics, Cost-benefit analysis, Pulp and paper industry, *Cost analysis, Waste treatment, Industrial wastes, Pollution abatement, Color, Lime, Biological treatment, Activated carbon, Adsorption, Sludge treatment, Sludge disposal, Water reuse, Water conservation, Regulation, Biochemical oxygen demand, Capital costs, Operating costs, Comparative costs, Suspended solids.
Identifiers: Kraft mills.

Estimates of engineering costs were prepared for liquid effluent treatments to meet various specified purification levels. Based on capital and operating cost data for six mill case histories, major findings were as follows: Treatment costs are directly related to water quality requirements and regulatory enforcement. Primary treatment costs depend on efficiency of settleable solids removal and ultimate sludge disposal. BOD as a water quality indicator also affects the secondary treatment cost which will double when desired BOD removal is raised from 85 to 90%. Tertiary treatment costs to remove 98% of 5-day BOD will be triple those for 85% removal. Kraft mill discharges can be decolored to 50 color units by massive lime treatment of bleach plant effluents plus adsorption of total effluents on activated carbon. Compared to 85% biological treatment, lime processing costs one-third; activated C about the same in capital but double in operating costs. As discharge regulations become more stringent, internal water conservation measures become more prevalent to reduce effluent volume through reduced freshwater intake. As much as 50% of treatment costs can be due to sludge disposal in mills providing 85% BOD removal plus sludge incineration. Major new developments aim at reducing pollutant discharges at their origin in the manufacturing flowchart. Minimization of treatment costs achievable by combined internal and external measures can vary with the final discharge objectives of any given mill. (Brown-IPC)

MERCURY REMOVAL FROM WASTE WATER WITH STARCH XANTHATE-CATIONIC POLYMER COMPLEX,
Agricultural Research Service, Peoria, Ill. Northern Regional Research Lab.
C. L. Swanson, R. E. Wing, W. M. Doane, and C. R. Russell.
Environmental Scince and Technology, Vol 7, No 7, p 614-619, July 1973. 5 fig, 2 tab, 10 ref.

Descriptors: *Mercury, Pollution abatement, *Waste water treatment, *Flocculation, *Chemical precipitation, *Polymers, Polyelectrolytes, Carbohydrates, Addities, Colloids, Zeta potential, Pollutants, *Cation exchange.
Identifiers: *Starch derivatives, Xanthates.

The sequential addition of starch xanthate and of a cationic polymer, such as poly (vinylbenzyltrimethylammonium chloride) or polyethylenimine, to a solution of Hg(II) will precipitate both polymers and the Hg as a cohesive floc that can be readily filtered. Some xanthate groups on the C backbone of the starch macromolecule may form Hg(II) salts, while others react with the polycatin to form a polyelectrolyte complex. The amount of xanthate required to precipitate the Hg plus the cationic polymer can be determined by streaming current potential measurements. The effectiveness of Hg removal depends on the ratios of Hg to cationic polymer to xanthate. A single treatment reduced the Hg concentration in a solution from 100,000 to as little as 3.8 microgram per liter. (Witt-IPC)
W74-04541

ELECTROLYSIS AS A PURIFICATION METHOD FOR EFFLUENTS OF THE PULP AND PAPER INDUSTRY (DIE ELEKTROLYSE ALS REINIGUNGSVERFAHREN FUER ABWAESSER DER PAPIER- UND ZELLSTOFFINDUSTRIE),
Technische Universitaet, Darmstadt (West Germany). Wasser- und Abwasserforschungsstelle.
W. Brecht, and H-L. Dalpke.
Das Papier, Vol 27, No 5, p 165-181, May 1973. 11 fig, 4 tab, 20 ref (English summary).

Descriptors: *Electrolysis, *Waste water treatment, *Pulp wastes, *Pollution abatement, Biochemical oxygen demand, Chemical oxygen demand, Pulp and paper industry, Treatment facilities, Organic wastes, Organic loading, Dissolved solids, Waste treatment, Foreign research.

The theory of electrolysis is reviewed. Laboratory and industrial-scale experiments on the electrolytic purification of effluents from two paper mills are reported, with emphasis on the effect of dissolved organic material on BOD. Evaluation of all results indicated that electrolysis is presently limited to a partial reduction of waste water BOD and possibly of COD, but does not achieve further effluent purification. (Wise-IPC)
W74-04542

MILL'S WASTE WATER USED FOR SPRAY IRRIGATION.

Descriptors: *Soil disposal fields, *Water reuse, Sprays, *Waste water disposal, *Pulp wastes, *Michigan, Pulp and paper industry, Industrial wastes, Waste disposal, Effluents, Irrigation, Costs, Operating costs, Capital costs, Maintenance, Soil physical properties, Permeability, Spraying.
Identifiers: Paper mills.

A waste water spray irrigation system built by Chemco Inc. of St. Joseph, Michigan, has been installed on a 90-acre plot of Watervliet Paper Co. at an estimated project cost of $1 million. Construction, operating, and maintenance costs of the system are expected to be lower than for more conventional effluent disposal plants. Open land and a highly permeable soil are required. (McClenahan-IPC)
W74-04543

SOLAR ENERGY FOR THE CONCENTRATION OF PULP MILL EFFLUENTS,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia). Div. of Chemical Engineering.
B. W. Wilson.
Appita (Journal of the Australian and New Zealand Pulp and Paper Industry Technical Association), Vol 26, No 2, p 134-135, Sept. 1972. 4 ref.

Descriptors: *Pulp wastes, *Evaporation, *Solar radiation, *Solar distillation, *Waste water treatment, Ponding, Effluents, Waste treatment, *Australia, Pulp and paper industry, Weather.
Identifiers: Spent pulping liquors, Black liquors, Eucalyptus trees, Concentrating(Thickness).

Because weather conditions in many parts of Australia permit large volumes of surface waters to be evaporated by solar energy, the application of this energy source to the concentration of organic matter and inorganic chemicals in aqueous pulp industry effluents is suggested. In preliminary experiments, spent liquors from the pulping of eucalypts (by the kraft and neutral sulfite semichemical processes) were ponded and exposed for 90 days at Melbourne. Despite heavy rainstorms, extensive evaporation was noted. Rapid evaporation was also observed in laboratory studies, in which black liquors were exposed to infrared lamps (simulating solar energy). For industrial practice, partial solar evaporation might be followed and completed by conventional mill evaporators and ultimate incineration. (Wise-IPC)
W74-04544

PHYSICOCHEMICAL PROCESSES FOR WATER QUALITY CONTROL,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
W. J. Weber, Jr., J. A. Borchardt, R. P. Cavale, J. L. Cleasby, and J. E. Couver.
Wiley-Interscience, New York, N.Y. 1972. 640 p.

Descriptors: *Water quality control, *Waste water treatment, *Pollution abatement, *Engineering education, *Water resources development, Water chemistry, Treatment facilities, Coagulation, Flocculation, Chemical precipitation, Membrane processes, Filtration, Oxidation, Disinfection, Corrosion, Aeration, Sludge treatment, Sludge disposal, Ion exchange, Adsorption, Sedimentation.

In 12 chapters contributed by 9 experts this treatise develops rational foundations for the design, interpretation, implementation, and control of physicochemical processes (not merely unit operatins) for achieving or mediating quality tranformations in natural waters, water supplies, and municipal and industrial waste waters. The text evolved from courses taught at the University of Michigan to advanced undergraduate and graduate students in environmental and water resources engineering, chemical and mechanial engineering, and chemistry. It seems also suited as a reference and/or refresher volume for practicing engineers and scientists involved with quality control. The introductory chapter deals with process dynamics, mechanics of mass transport, reaction kinetics and equilibria, reactor engineering, and process design. Subsequent chapters discuss coagulation and flocculation, sedimentation, filtration, adsorption, ion exchange, membrane processes (reverse osmosis, ultrafiltration, electrodialysis), chemical oxidation (with oxygen, ozone, chlorine, permanganate, etc.), disinfection and disinfectants, corrosion and its control, aeration and gas transfer, and sludge treatment and disposal. Study problems (with approaches to solutions) and pertinent literature citations are given after each chapter. (Brown-IPC)

LIME DISINFECTION OF SEWAGE BACTERIA AT LOW TEMPERATURE.
Colorado State Univ., Fort Collins. Dept. of Microbiology.
S. M. Morrison, K. L. Martin, and D. E. Humble.
Copy available from GPO Sup Doc as EP1.23:660/2-73-017, $1.25; microfiche from NTIS as PB-228 545, $1.45. Environmental Protection Agency, Technology Service Report EPA-660/2-73-017, September 1973. 90 p, 33 fig, 18 tab, 81 ref. EPA Project 16100 PAK.

Descriptors: *Lime, *Sewage treatment, *Low temperature, *Sewage bacteria, *Disinfection, Calcium hydroxide, Alkali, Municipal wastes, Coliforms, Biochemical oxygen demand, Orthophosphate, Coagulation, Alaska, High altitude, Bioindicators, Hydrogen ion concentration, *Waste water treatment.
Identifiers: Excess lime treatment, Bacterial control.

Small isolated communities in cold climate areas need a simple, inexpensive, reliable sewage system which includes disinfection. This laboratory study provides clarifying data on the action of lime as a sewage disinfectant at low temperatures. Nutrient level reductions were also studied. Lime was added to raw and activated sludge treated sewage to attain pH intervals between 10 and 12 at temperatures of 1, 5, 10 and 15C. Membrane filter procedures were used to follow decreases in total and fecal coliform populations and total plate counts at each test pH and temperature. In both sewages, it was observed that pH values above 11 were required to reduce coliform populations to levels below 100/ml in less than 8-12 hours. To attain coliform population reductions to 1/ml or less, 24 hours were required at pH 11 but only 90 minutes at pH 11.5. Coliforms and other organisms concentrated in the precipitated solids during lime treatment; their numbers decreased as pH and/or contact time increased. Temperature was a less significant factor in the disinfection mechanisms than was pH. An additional effect of lime treatment of sewage is the reduction of organic and inorganic chemical loads in the effluent. The reductions at 15C for raw and 10C for secondary treated, measured by BOD and orthophosphate tests, reached maximum BOD removals of 77 and 94%, respectively, at PH 11 in 24 hours for raw and at pH 11.5 in 90 minutes for treated sewage. Likewise, maximum orthophasphate removals, 93 and 97%, respectively, were obtained at pH 12.0 for 60 minutes with raw and treated samples. (EPA)

WASTE AUTOMOTIVE LUBRICATING OIL AS A MUNICIPAL INCINERATOR FUEL,
GCA Corp., Bedford, Mass. GCA Technology Div.
Copy Available from GPO Sup Doc as EP1.23/2:73-293, $1.05; microfiche from NTIS as PB-228 601, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-293, September 1973. 74 p, 9 fig, 9 tab, 54 ref. EPA Project 15080 HBO, Contract 68-01-0186.

Descriptors: *Oil wastes, Industrial wastes, *Waste treatment, *Incineration, *Air pollution, Fuels.
Identifiers: *Refuse combustion, Heat flux.

The technical, economic and environmental impact of utilizing waste automotive lubricating oils to improve the municipal incineration combustion process was examined. Laboratory analyses of selected physical properties of waste oil and a waste oil burner testing program were conducted to complement an information search program. The physical and chemical properties of waste oil were reviewed in relation to its suitability as a fuel oil. The auxiliary fuel heat flux requirements to offset the adverse effects of wet refuse were estimated utilizing a combustion model of a refuse bed. Various methods were evaluated for transferring this required heat flux to the refuse bed. Suggested design for monitoring and control; and waste oil storage and feed systems were presented. The impact on air quality from the combustion of waste oil in a municipal incinerator was estimated. Three-month average ground level concentrations for lead were calculated and presented as concentration isopleths. Capital investment and

operating costs were developed for auxiliary waste oil systems in conjunction with municipal incinerators. (EPA)

200 MGD ACTIVATED SLUDGE PLANT REMOVES PHOSPHORUS BY PICKLE LIQUOR,
Milwaukee Sewerage Commission, Wis.
R. D. Leary, L. A. Ernest, R. S. Powell, and R. M. Manthe.
Copy Available from GPO Sup Doc as EP1.23:670/2-73-050, $1.50; microfiche from NTIS as PB-228 561 $1.45. Environmental Protection Agency Technology Series Report EPA-670/2-73-050, September 1973. 127p, 34 fig, 9 tab, 39 ref. EPA Project 11010 FLQ.

Descriptors: *Activated sludge, *Biological treatment, Chemical precipitation, *Iron, Phosphorus, *Wisconsin, *Waste water treatment, Sulfates.
Identifiers: *Phosphorus removal, Milwaukee(Wis), *Pickle liquor, Ferrous sulfate.

The Milwaukee Sewerage Commission's Jones Island Waste Water Treatment Plant consists of a mutual primary treatment facility followed by two separate activated sludge plants. To enhance phosphorus removal in the 115 MGD East Plant, hot spent sulfuric acid pickle liquor (ferrous sulfate) was added for a one year test period in 1970 while the 85 MGD West Plant was operated as a control. This follow up report covers the 1971 operational period in detail and the first four months in 1972. An average of 8.0 mg, Fe/l of pickel liquor iron (8436 lbs. Fe/day) was added in 1971 to the East Plant mixed liquor, producing an effluent total phosphorus concentration of 0.69 mg P/l and a total soluble phosphorus concentration of 0.15 mg P/l. This performance is based upon a raw screen sewage total and total soluble phosphorus concentration of 7.1 and 2.3 mg P/l, respectively. In an attempt to enhance phosphorus removal in the West Plant, East Plant waste sludge containing a higher iron content was added to the West Plant return sludge starting in April 1971. This procedure increased the iron content of the West Plant but did not substantially increase the West Plant phosphorus removal. During the 12 month period from May 1971 to April 1972, the West Plant effluent total and total soluble phosphorus concentrations averaged 1.5 and 0.64 mg P/l, respectively. (EPA)

ALLOCATION OF FUNDING FOR WASTEWATER TREATMENT FACILITIES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. S. Hunter, III.
Journal Water Pollution Control Federation, Vol 46, No 1, p 18-27, January 1974. 3 fig, 17 ref.

Descriptors: *Water pollution control, *Waste water treatment, *Treatment facilities, *Cost-benefit analysis, *Project benefits, *Systems analysis, Mathematical models, Administration, Optimization, Estimating, Evaluation, Welfare(Economics).
Identifiers: *Funding(Allocation).

Priority systems developed by state administrative authorities to allocate federal wastewater treatment plant construction grant funds contain deficiencies and have been ineffective in directing this money to the most beneficial projects. A benefit-cost ratio approach to fund allocation is preposed that overcomes many of the shortcomings of current procedures. Systems analysis techniques are presented that can be used to obtain the necessary full and flexible consideration of all possible alternative funding combinations. Of particular interest is the development of a benefit estimation technique which can be used for evaluating water pollution control projects. The technique can be considered an optimization procedure, in this case for finding the mix of treatment facilities that maximizes benefits within a given budget constraint. Interdependencies among the four dimensions of the water resource (time, quantity, location, and quality) and the various uses to which the water resource can be put are taken into account. More attention must be given to the actual benefits obtained from water quality management projects. (Bell-Cornell)

WHAT'S WRONG WITH GOVERNMENT WATER CONTROL PROGRAMS AND HOW THEY CAN BE IMPROVED,
Georgia Coll., Milledgeville. Dept. of Business Administration and Economics.
R. M. Piper.
Paper Trade Journal, Vol 157, No 12, p 31-33, March 19, 1973. 2 tab.

Descriptors: *Pulp and paper industry, *United States, Surveys, *Federal government, *Water quality control, *Legal aspects, *Regulation, Water policy, Project planning, Economics, Capital costs, Waste water treatment, Biological treatment, Ecology, Economic prediction, *Water quality standards, Administration, Pollution abatement, Planning, Research priorities.
Identifiers: Incentives, Economic incentives.

An opinion survey of the U.S. paper industry regarding water quality legislation was conducted in 1971. Results indicated that the percentage of industry effluents receiving secondary treatment would rise from 16% in 1965 to 96% in 1975, and that industrial expenditures for pollution abatement facilities would increase from 6% of total plant and equipment investments in 1965 to ca. 18% in 1975. Reported discontent with governmental water control programs is discussed in the areas of water quality standards, intergovernmental relations, environmental planning, and economic problems. Suggestions for existing program improvement (rather than for new legislation) are made in the sectors of environment planning water standards, economic incentives and research needs. A better balance between ecological goals and economic sacrifices is urged. (Witt-IPC)

HYPOCHLORINATION OF POLLUTED STORM-WATER PUMPAGE AT NEW ORLEANS,
Pavia-Byrne Engineering Corp., New Orleans, La.
U. R. Pontius, E. H. Pavia, and D. G. Crowder.
Copy Available from GPO Sup Doc as EP1.23:670/2-73-067, $1.95; microfiche from NTIS as PB-228 581, $1.45. Environmental Protection Agency, Technology Series Report, EPA-670/2-73-067, September 1973. 188 p, 53 fig, 23 tab, 33 ref. EPA Project 11023 FAS.

Descriptors: *Disinfection, *Chlorination, *Water pollution treatment, *Treatment facilities, *Storm runoff, Coliforms, Operation and maintenance, Plastic pipes, Oxidation-reduction potentials, Centrifugal pumps, Concrete lined canals, Protection coatings, Sodium compounds, Storage tanks, *Louisiana, *Waste water treatment.
Identifiers: *Hypochlorination, Sodium hypochlorite manufacturing facilities, Lined steel storage tanks, New Orleans, Hypochlorite feeding facilities, Residual chlorine analyzers.

Storm water from the streets of New Orleans flows to large drainage pumping stations where it is discharged into lake Pontchartrain by means of long outfall canals. To reduce the coliform density, storm water was disinfected with sodium hypochlorite (NaOCl). Project facilities included manufacture, transportation, storage and feeding of 100 gram/l NaOCl. Residual chlorine analyzers were used to monitor NaOCl dosage levels. Sixteen high volume storms totaling 10 to the 9th power gal. of storm water were treated with more than 35,000 gal. of NaOCl. Total and fecal coliform in untreated storm water exceeded 1000 org/100 ml, 99% of the time. Coliform densities in treated water were significantly reduced, with chlorine residuals (total available) of greater than 0.5 mg/l resulting in 99.99% or greater removal. However, rapid recovery of coliform levels occurred within 24 hours. Total coliform recovered to pre-disinfection levels, but fecals did not. The recovery did not appear to be the result of tidal influences. Long term fecal coliform levels were reduced by one order of magnitude in each outfall canal. The amortized cost of NaOCl manufacturing, transporting, feeding and control facilities was $53,600/yr. NaOCl costs for treating 5 times 10 to the 10th power gal. of storm water yearly were $200,300. This resulted in a treatment cost of $.000051/gal. (EPA)

SURVEY OF FACILITIES USING LAND APPLICATION OF WASTEWATER,
American Public Works Association, Chicago, Ill.
R. H. Sullivan, M. M. Cohn, and S. S. Baxter.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402 Price $6.80. Environmental Protection Agency, Office of Water Program Operations, Report EPA-430/9-73-006, July 1973, 377 p, 23 fig, 98 tab, 114 ref.

Descriptors: *Water reuse, *Land management, *Treatment facilities, Surveys, *Water spreading, Waste disposal, *Waste water disposal, Domestic wastes, Industrial wastes, *Waste water treatment, Tertiary treatment, Land use, Zoning, Monitoring, Water pollution, Soil types.
Identifiers: *Land application(Waste water), *Spray irrigation, Waste water transport.

A field survey was made of 100 major facilities where land applications of domestic or industrial wastewater effluents were utilized; agricultural wastes facilities and evaporation-percolation or spray runoff type facilities were not investigated. Land application systems are generally used seven days per week; application rates for crop irrigation are generally about two inches per week (54,300 gallons per acre per week). Sand, loam and silt were the most common soil types. Industries generally treat their total waste flow by land application; municipalities varied from less than 25 percent to all of the wastewaters discharged. Secondary treatment, generally lagooning, is provided by municipalities prior to land application; industries frequently treat their process wastes by screening only. Spray irrigation is the most frequently used method of application (57 facilities) mainly by industries. Ridge and furrow irrigation is used at 23 facilities and flooding irrigation by 34 systems. Land use zoning for land application sites is predominantly classified as farming, with some residential zoning in contiguous areas. Wastewater generally is transported to the application site by pressure lines, although some municipalities utilize ditches or gravity flow pipe lines. More than half of the community land application facilities have been in use for more than 15 years; industrial systems for a lesser period of time. Renovated wastewater is seldom collected by underdrains; rather, evaporation, plant trans-

piration, and groundwater recharge take up the flow. Monitoring of groundwater quality, soil contaminants, crop uptake, and surface water is not carried out with any consistency.

PROCESSES FOR REDUCING THE ORGANIC-CARBON CONTENT OF WATER CONTAMINATED WITH ORGANIC COMPOUNDS BY CONTINUOUS COUNTERCURRENT MULTISTAGE TREATMENT WITH ACTIVATED CARBON,
Environmental Protection Agency, Washington, D.C. (Assignee).
W. G. Timpe, and E. W. Lang.
U.S. Patent No. 3,763,040, 5 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 274, October 2, 1973.

Descriptors: *Patents, *Waste water treatment, *Organic compounds, *Activated carbon, *Pulp wastes, Pulp and paper industry, *Industrial wastes, Pollution abatement, Water pollution control, Water quality control.

The process for reducing the organic-carbon content of contaminated water comprises subjecting the water to a continuous countercurrent multistage treatment with particulate activated carbon in several tanks. A high slurry density is maintained in each tank. The slurry is stirred continuously and portions free of solid particles are withdrawn and transferred into a consecutive tank of the series. The activated carbon particles have sizes between 104 and 250 microns. Fresh activated carbon particles are continuously charged into the last of the series of tanks or stages at a dosage or rate such that the total organic-carbon content of the incoming contaminated water is reduced to the preselected value. The spent carbon particles are withdrawn from the first of the tanks or stages in series at substantially the same rate as fresh activated carbon is charged to the last tank or stage. The tanks or stages are connected in such manner that the water can flow or be charged continuously from the first to the last tank or stage of the series and portions of the water containing dispersed carbon particles that are undergoing treatment in each of the tanks or stages can be withdrawn and charged countercurrently to the flow of the water from each tank to a preceding tank or stage in the series. Each tank or stage is provided with screens or baffles which create a clarification zone that retains or holds back carbon or other solid particles that are dispersed in the slurry and permits the treated water to flow out of the tank or stage to the next, or out of the last tank or stage, as a clear liquid essentially free of suspended carbon or other solid particles. APPARATUS FOR TREATING INDUSTRIAL AND DOMESTIC WASTE WATERS,
Westinghouse Electric Corp., Pittsburgh, Pa. (Assignee).
A. B. Turner.
U.S. Patent No. 3,774,768, 5 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 916, No 4, p 1360, November 27, 1973.

Descriptors: *Patents, *Biochemical Oxygen Demand, *Industrial wastes, *Domestic wastes, *Waste water treatment, *Oxygenation, Pollution abatement, Water quality control, Water pollution control.

A system is described for removing BOD from waste water. A single containment structure incorporates a surge aeration tank and a system for transferring oxygen to a liquid which is circulated through a contact section to establish contact of the oxygen containing gas-suspended solids--liquid mixture. The structure maximizes the oxygen utilization within the system while simultaneously generating small air bubbles to achieve great efficiency and rapid removal of the BOD. The system for treating waste waters includes a pair of concentric tanks forming a space which serves as an aeration chamber. Untreated but screened waste water is discharged into the space and withdrawn from it by a pump which passes the liquid through an oxygenating device which induces air into the liquid. The liquid is then circulated through long tubing wound around the outside peripheral surface of the tank to obtain intimate contact between the gas, liquid and solids therein and to convert dissolved material into insoluble material by a conventional biochemical process. The liquid thus processed in the tubing is introduced into the central or inner tank where the treated solids rise to the surface for recycling in the system while the liquid effluent is filtered and discharged to a river or stream. (Sinha-OEIS)
W74-04707

SEDIMENTATION TANKS,
British Wedge Wire Co. Ltd., Warrington (England), (Assignee).
V. Sparham, and G. F. Pinner.
U.S. Patent No. 3,774,770, 5 p, 6 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 916, No 4, p 1361, November 27, 1973.

Descriptors: *Patents, *Waste water treatment, *Sedimentation, Equipment, *Filtration, Pollution abatement, Water pollution control, Water quality control.
Identifiers: *Settling tanks.

A sedimentation tank for liquid purification has a submerged horizontal filtering screen for purifying liquid passing upward through it and a scraping mechanism for scraping sludge from the bottom of the tank towards a sludge outlet. The filtering screen extends across the greater part of the interior of the tank, the zone above it being partitioned from an adjoining zone through which extends downwardly a transmission element drivably connecting the scraping mechanism to an outside power source. (Sinha-OEIS)
W74-04708

METHOD AND APPARATUS FOR THE BIOLOGICAL TREATMENT OF WASTE WATER,
Autotrol Corp., Milwaukee. Wis. Bio-Systems Div. (Assignee).
W. N. Torpey.
U.S. Patent No. 3,776,841, 4 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 917, No 1, p 286, December 4, 1973.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, Suspended solids, Pollution abatement, Water pollution control, Water quality control.
Identifiers: Settling, *Carbonaceous wastes.

Forcibly rotating bodies that are partially submerged in waste water provide surface area on which biological slimes develop and serve the purpose of removing pollutants from the waste water. The rotating, partially submerged bodies are located in the upper portion of the treatment tanks, to provide a biological treatment zone. A subjacent settling zone, physically separated from the biological treatment zone by a 'false bottom' or longitudinal baffle is provided in the lower portion of the treatment tank. Waste water introduced in the tank is first biologically treated and then circulated through the subjacent settling zone to remove settleable solids. Virtually all, usually 100% of the biologically treated waste water is forced through the subjacent settling zone which, because of its physical separation from the rotating contactors is quiesent and capable of a high removal of suspended solids. The improved apparatus and method result in a consistent removal of carbonaceous pollutants from the waste water with a minimum spillover of suspended solids thereby eleiminating the neef for subsequent solids removal apparatus. (Sinha-OEIS)
W74-04709

SCREENING AERATOR CONCENTRATOR,
Sweco, Inc., Los Angeles, Calif. (Assignee).
P. H. Mook, and T. R. Westfall.
U.S. Patent No. 3,775,311, 4 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 916, No 4, p 1493, November 27, 1973.

Descriptors: *Patents, *Waste water treatment, *Aeration, *Aerators, Equipment, *Froth flotation, Pollution abatement, Water pollution control, Water quality control.

The apparatus comprises a fine mesh rotating screening aerator combined with a froth flotation system. Although the rotating screen separator by its very nature creates a certain amount of froth, this frothing ability can be enhanced by this invention which adapts such separators to make use of their aerating capability. The frothing potential may be enhanced by various methods. One is to introduce a stream of air into the influent just before it passes into the rotating screen separator. Another is to add a series of vanes on the rotating screen cage to increase air circulation. Such methods of adding air, or ensuring an adequate supply of air into the apparatus, enable an increase in the dissolved oxygen which enhances the life-sustaining and aerobic digestion qualities of the effluent. (Sinha-OEIS)
W74-04712

METHOD AND APPARATUS FOR TREATING EFFLUENT,
Mono Pumps (Engineering) Ltd., London (England). (Assignee).
A. P. Hopwood.
U.S. Patent No. 3,773,660, 3 p, 2 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 916, No 3, p 1051, November 20, 1973.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Equipment, *Pollution abatement, *Water pollution control, *Water quality control.

A method of treating raw sewage consists of the steps of macerating the effluent, passing it to a vessel containing submerged contact media and passing air through the vessel and the effluent is fed into the lower region of the vessel. Biologically purified effluent can leave the top of the vessel and pass to a suitable settlement tank and the sludge can be separated for treatment in a sludge treatment vessel. The effluent from the settlement tank can be passed to at least one more stage wherein the above steps, with the exception of maceration, are repeated. The effluent can, alternatively, be passed from the first vessel to a second vessel and then to a settlement tank. (Sinha-OEIS)
W74-04714

PROCESS FOR PURIFYING WATER THAT CONTAINS ORGANIC MATTER,
Kurita Water Industries Ltd., Osaka (Japan). (Assignee).
Y. Misaka, M. Kuriyama, and T. Mukai.
U.S. Patent No. 3,763,038, 5 p, 1 fig, 9 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 273, October 2, 1973.

Descriptors: *Patents, Pollution abatement, *Waste water treatment, *Organic matter, *Flocculation, *Coagulation, Microorganisms, Iron, *Aeration, Water purification, Sedimentation.
Identifiers: Ferric salts, Ferrous salts, Oxidants.

The process comprises a series of treatment steps of mixing coagulants consisting of either a ferric salt alone or a ferrous salt and an oxidant into the sewage. The sewage is agitated to stimulate floc formation and growth. In a sedimentation section separation of effluent and sludge takes place. The effluent is introduced into an aeration tank where iron floc is formed and the microorganisms are adsorbed on the flocs. (Sinha-OEIS)
W74-04716

METHOD OF TREATING SEWAGE USING HIGH POLYMER RATIO FLOCCULATION AGENT BIOLOGICALLY PRODUCED IN SITU,
Houdaille Industries, Inc., Buffalo, N.Y. (Assignee).
G. E. Wilson.
U.S. Patent No. 3,763,039, 12 p, 9 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 915, No. 1 p 273, October 2, 1973.

Descriptors: *Patents, Polymers, Microorganisms, *Flocculation, *Suspended solids, *Sewage treatment, *Activated sludge, Pollution abatement, *Waste water treatment, Water quality control, Water pollution control.

A high polymer ratio flocculation agent is introduced into raw sewage to remove colloidal suspended solids in the primary clarifier of a sewage treatment plant. The flocculation agent comprises at least 10 percent by dry weight biologically derived polymeric material and can be derived in situ from microorganisms that are commonly found in an activated sludge process. The flocculation agent is produced by subjecting microorganisms capable of generating polymeric material to a high flood content environment in an aeration tank into which supernatant from the primary clarifier is delivered and then subjecting the microorganisms to a low food content environment, as a consequence of which polymeric material is generated through the extracellular activity of the microorganisms. (Sinha-OEIS)
W74-04717

APPARATUS FOR TREATING WASTE FLUIDS BY MEANS OF DISSOLVED GASES,
Pollution Control Engineering, Inc., Downey, Calif. (Assignee).
G. E. Hurst.
U.S. Patent No. 3,773,179, 4 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 916, No 3, p 932, November 20, 1973.

Descriptors: *Patents, Flotation, Gases, *Waste water treatment, *Pollution abatement, *Water pollution control, *Water quality control.
Identifiers: *Dissolved gases.

Water to be treated is pumped a number of times from different compartments of a floatation tank. The flow of water can be relatively smaller and at each pumping operation more gas can be injected into the flow so that more gas is forced into solution than could be obtained with a large flow through a single pump. The discharge into each tank compartment is confined to a relatively small area as well and then is discharged against a deflector plate which actually scrubs the oil or suspended matter out of the waste water. The oil or suspended matter which is caused to float in each compartment is then removed from the surface either by a continuous belt skimmer, by passing it over a weir or using a moving skimmer arm and the clarified water is removed from the bottom of the final compartment. In the first compartment fluid is withdrawn, gas is injected into the flow, and then it is returned to the same compartment and discharged against a deflector plate. A second pump takes fluid from the first compartment and discharges it into the second compartment and a third pump takes fluid from the second compartment and discharges it into the third compartment. At the point of gas injection, flocculent materials can also be introduced if necessary. (Sinha-OEIS)
W74-04719

TRICKLING FILTER-ACTIVATED SLUDGE COMBINATIONS FOR DOMESTIC WASTE-WATER TREATMENT,
Rieke, Carrol, Muller Associates, Inc., Hopkins, Minn.
R. F. Roskopf, J. C. Young, and E. R. Baumann.
Available from NTIS, Springfield, Va. 22151 PB-221 090 for $3.00 printed copy; $1.45 microfiche. Iowa State University Engineering Research Institute Special Report 73107, May 1973. 203 p, 42 fig, 7 tab, 89 ref, 3 append.

Descriptors: *Waste water treatment, *Trickling filters, *Iowa, Sewage treatment, Activated sludge, Municipal wastes, *Sludge treatment.
Identifiers: *Ames(Iowa).

The feasibility of using a new activated sludge process in series or parallel with an existing trickling filter was studied as a means of upgrading and/or expanding the capacity of a domestic wastewater treatment plant. Typical domestic wastewater (Ames, Iowa primary settling tank effluent) was used throughout the study as pilot plant influent. Both biological pilot units performed typically when used as first-stage units. Pilot trickling filter performance was essentially the same as that of the Ames trickling filters. Second-stage unit performance was dependent upon first-stage performance, and warm weather nitrification was obtained with the TF-A process. All three combinations had potential for economically providing a high quality final effluent, although both series processes seemed to have performance advantages over the parallel process. With approximately equal volumes of aeration tank and trickling filter, the overall performance of each series combination was essentially equal to or greater than the performance of an equally loaded activated sludge process. The parallel process provided a greater overall performance than could be obtained by combining the effluents from parallel but separate activated sludge and trickling filter plants. The existing Ames plant could be economically upgraded and expanded with a series TF-A process having the flexibility of parallel operation when so desired. (Knapp-USGS)
W74-04798

OZONIZATION AS A METHOD OF PURIFYING WATER POLLUTED WITH CHEMICAL COMPOSITION, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut (I) (USSR).
A. A. Korolev.
Gig Sanit. 37(12): p 78-83. 1972.
Identifiers: Chemical compounds, *Ozonization, Polluted waters, *Water purification, *Public health, *Waste water treatment.

The use of ozone for purifying water and industrial waste polluted with chemical compounds should be studied constantly by hygienists. Investigators have concentrated on an evaluation of the quantitative aspect of the problem of ozonization (the degree of decomposition of various substances, the magnitude of the bactericidal effect, etc.). The qualitative biological aspect of ozonization was not reported. The need for such investigations was dictated by the increasing use of ozone for water treatment and waste purification.--Copyright 1973, Biological Abstracts, Inc.

LAND DISPOSAL OF WASTE GASES: 1. FLOW ANALYSIS OF GAS INJECTION SYSTEMS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
S. Miyamoto, A. W. Warrick, and H. L. Bohn.
Journal of Environmental Quality, Vol 3, No 1, p 49-55, January-March 1974. 8 fig, 2 tab, 17 ref.

Descriptors: *Waste disposal, *Soil disposal fields, *Gases, Permeability, Soil chemical properties, Soil physical properties, Diffusion, Seepage.
Identifiers: *Waste gas disposal, Air pollution control.

The steady-state flow of gases in soils was analyzed mathematically from the view of land disposal of waste gases. Gas injection systems considered include ditches, buried pipes, and wells. The systems are compared on the basis of two criteria: how effectively the power is used (power efficiency); and how uniformly the gas is distributed through soils (uniformity). Often the two criteria are in conflict, and systems giving a high power efficiency result in low uniformity. Gas injection by buried porous pipe appears advantageous over ditch or well systems. (See also W74-04480) (Knapp-USGS)
W74-04479

LAND DISPOSAL OF WASTE GASES: II. GAS FLOW FROM BURIED PIPES,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
A. W. Warrick, and S. Miyamoto.
Journal of Environmental Quality, Vol 3, No 1, p 55-60, January-March 1974. 8 fig, 1 tab, 5 ref.

Descriptors: *Waste disposal, *Soil disposal fields, *Gases, Permeability, Soil chemical properties, Soil physical properties, Diffusion, Seepage.
Identifiers: *Waste gas disposal, Air pollution control.

Steady-state compressible gas flow in homogeneous soils from buried porous pipes was analyzed for the purpose of developing land disposal systems for waste gases. Two different cases are considered: the ground surface partially covered by an impermeable barrier; and the surface corrugated with alternating ridges and valleys with the pipe buried under the ridges. The partial surface barrier provides a more uniform gas flow in soils than without it, but leads to an increase in the power required to inject gas at a given rate, expecially when the pipe spacings are wide. Compared to an open level surface, the corrugated geometry results in a better gas distribution with little increase in power required and is probably the better system for injecting waste gas in nonstratified soils. (See also W74-04479) (Knapp-USGS)

PAPER MILL SLUDGE DISPOSAL ON SOILS: EFFECTS ON THE YIELD AND MINERAL NUTRITION OF OATS (AVENA SATIVAL.),
Wisconsin Univ., Madison. Coll. of Agricultural and Life Sciences.
S. G. Dolar, J. R. Boyle, and D. R. Keeney.
Journal of Environmental Quality, Vol 1, No 4, p 405-409, 1972. 6 tab, 16 ref.

Descriptors: *Sludge disposal, *Soil disposal fields, *Pulp wastes, Agronomic crops, *Oats, Waste water treatment, Nutrients, *Nitrogen compounds, *Fertilizers, Ultimate disposal, Waste disposal, Cereal crops, Plant growth, Trace elements, Solid wastes.

Sludge from paper mill effluents was mixed with soil in amounts of 2.5 or 10% (based on dry weight of the soil), and the effects of these mixtures on the growth of planted oats were investigated. Sludges from secondary treatment processes contained sufficient amounts of nitrogen, namely, nitrogen to organic carbon ratios of 1:12 to 1:50, and did not interfere with plant growth, whereas sludges from primary effluent treatments were deficient in N. High sludge concentrations inhibited plant growth, probably by affecting the uptake of Cu, Al, Fe, Zn, Mn, and similar trace elements. (Witt-IPC)

HYDROGEOLOGIC CONSIDERATIONS IN SOLID WASTE STORAGE IN IOWA: PART 1. SANITARY LANDFILL SITE SELECTION: PART 2. A METHOD OF HAZARDOUS AND TOXIC WASTE DISPOSAL,
Geological Survey, Iowa City, Iowa.
S. J. Tuthill, D. L. Gordon, and F. H. Dorheim.
Public Information Circular No 4, September 1972. 59 p, 18 fig, 2 tab, 3 ref, append.

Descriptors: *Landfills, *Waste disposal wells, *Iowa, *Hydrogeology, Water law, *Regulation, Garbage dumps, Industrial wastes, Municipal wastes, Water pollution control.

In regions of low-density population, such as Iowa, a sanitary landfill that is precisley engineered and properly managed appears to be the most satisfactory solution for disposing of solid waste. Site selection is a question of first importance to the initial and long-range success of any landfilling operation. The requirements of the Iowa Code with respect to landfill site selection are discussed and geologic criteria that pertain to these rules are explained. Guidelines are discussed that indicate types of earth and rock conditions in Iowa that would tend to safeguard water resources. Where a less favorable site has to be used because of other constraints, suggestions are made that may assist the responsible community agency to make necessary modifications to protect the regional water supplies. Toxic-waste disposal in shale terrane is feasible by storing these waste fluids in drums within vertical shale storage shafts bored in essentially impermeable rock units. The shale storage shafts would be bored to depths limited only by the thickness of the rock unit and would accommodate a series of steel drums stacked in the holes. A minimum thickness of 30 feet of the same undisturbed shale should extend below any given storage shaft. The rock unit in which the shafts are excavated should be unjointed, unfractured, unfaulted, and nonfissile. (Knapp-USGS)
W74-04592

HYDROLOGIC AND GEOLOGIC CONSIDERATIONS FOR SOLID-WASTE DISPOSAL IN WEST-CENTRAL FLORIDA,
Geological Survey, Tallahassee, Fla.
J. W. Stewart, and A. D. Duerr.
Water-Resources Investigations 50-73, October 1973. 52 p, 36 fig, 17 ref.

Descriptors: *Landfills, *Garbage dumps, *Hydrogeology, *Path of pollutants, Water pollution sources, Groundwater movement, *Florida, Water pollution control, Planning, *Solid wastes, *Waste disposal.

Hydrogeologic studies are a prerequisite to selecting landfill sites in the karst topography of west-central Florida to minimize water pollution problems. Much of the area is low, poorly drained, and the water table is near land surface. Preparation of selected sites usually will require the construction of trenches with dikes to facilitate dewatering, extra pumps for dewatering during high intensity rainfall, and construction of oxidation ponds for retaining water pumped directly from active trenches, prior to discharging water out of the area. A water-quality network is also established to monitor the effects of solid wastes on the water resources of an area. The report contains 73 photographs that illustrate the various operations of solid-waste disposal, beginning from the initial investigation of a site to final burial of solid waste in a trench. WATER PURIFICATION,
R. A. Starke.
U.S. Patent No. 3,776,524, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 917, No 1, p 211, December 4, 1973.

Descriptors: *Patents, *Water purification, *Filtration, Water quality control, Water pollution control, Pollution abatement, *Chlorination, *Waste water treatment, *Water treatment.

This invention relates to the chlorination of water for the purposes of sterilizing the water and more particularly the invention relates to the chlorination of water by means of gaseous chlorine produced in an electrolytic cell. It consists of a mixing chamber in which gaseous chlorine is mixed with water. The chamber has a float controlled inlet and an outlet dipping below the water level established by the float controlled valve. At a position above the water level there is an orifice and a chlorine gas inlet. The orifice limits the negative pressure in the chlorine gas inlet when water passes through the orifice under suction applied to the outlet. There is also provided a water filtering system wherein a supply of water under pressure is connected to the liquid inlet of the mixing chamber. The supply of chlorine gas is connected to the second inlet and the outlet passage is connected to a water pipe associated with the filter system, such that a negative pressure is applied to the outlet in operation. STATE-OF-ART REVIEW: WATER POLLUTION CONTROL BENEFITS AND COSTS, VOL I,
Development Planning and Research Associates, Inc., Manhattan, Kans.
S. G. Unger, M. J. Emerson, and D. L. Jordening.
Copy Available from GPO Sup Doc as EP1.23:600/5-73-0082, $1.45; microfiche from NTIS as PB-228 603 $1.45. Environmental Protection Agency, Socioeconomic Studies Series Report EPA-600/5-73-008a, October 1973. 121 p, 31 exhibits. EPA Project 21-AQJ-05, 68-01-0744.

Descriptors: *Cost-benefit analysis, *Water pollution control, Water quality control, Benefits, Costs, Economics, *Reviews, *Pollution abatement, *Cost comparison.

A survey and assessment are presented of the state-of-art of economic analyses dealing with water pollution control benefits and costs. The investigation includes the extension of traditional benefit cost analysis into the area of pollution control. Implications for planning and research plus some directions of needed study are also

developed. A conceptual basis for benefit cost analysis involving water quality management is suggested. An economic concept of a social welfare function is presented as the most widely accepted public criterion which embodies environmental quality concerns. Problems of efficiency, equity, externalities and social discount rates are outlines. Also, the adequacy of such information is assessed. Benefit measurements of water quality factors are meager and underdeveloped. A variety of parial-equilibrium approaches to benefit measurement are outlined and some problems, including the planning horizon (time profile), are described. To assess benefit cost impacts of water pollution control, location-preserved analyses are necessary. An aggregation framework is needed. General systems analysis approaches are implicitly required to measure benefits and costs of pollution control. Recent developments in the literature have begun to directly assess impacts of environmental quality management. In this setting, benefit cost analysis effectively becomes a supplementary analysis of alternative sets of simulated general equilibrium types of economic solutions. (Freeman-EPA)
W74-04464

RESEARCH NEEDS AND PRIORITIES: WATER POLLUTION CONTROL BENEFITS AND COSTS, VOL. II,
Development Planning and Research Associates, Inc., Manhattan, Kan.
D. L. Jordening, and J. K. Allwood.
Copy available from GPO Sup Doc as EP1.23:600/5-73-008b, $2.10; microfiche from NTIS as PB-228 602 $1.45. Environmental Protection Agency, Socioeconomic Study Series Report, EPA-600/5-73-008b, October 1973. 198 p, 29 exhibits. EPA Project 21-AQJ-05, 68-01-0744.

Descriptors: *Cost-benefit analysis, *Water pollution control, Water quality control, Benefits, Costs, Economics, *Research priorities, *Pollution abatement, *Cost comparisons.
Identifiers: *Research needs.

A specification is presented of research needs and priorities involving water pollution control costs and benefits. A series of theoretcal and methodological research needs are presented. Water quality management is required in a dynamic setting and over a broad range of hydrologic and economic conditions. The common property resource aspects of the problem with the prevalence of externalities complicates the issues involved. These and other factors embedded in the research needs are discussed. A major development of a cost-minimization methodological approach for water quality management is also presented. Within this framework the indicated research needs are more readily identified and explained. An important distinction is made between the economic costs of pollution and the costs of pollution abatement. The economic costs of pollution such as damages, efficiency reductions, increased production expenses, process changes and opportunity costs are a function of water quality, whereas pollution abatement costs are typically a function of the degree of pollution control. For comparable cost comparisons, a transformation of pollution abatement costs in terms of water quality is desired. This transformation need and problem is discussed in detail. Finally, in a series of technical appendicies, the following subjects are discussed: (1) water pollution control cost and benefit estimates, (2) water quality associated health impacts. (Freeman-EPA)
W74-04465

STATE ENVIRONMENTAL MANAGEMENT, CASE STUDIES OF NINE STATES,
E. H. Haskell, and V. S. Price.
Praeger, New York, N.Y. 1973. 283 p. Price: $5.95.

Descriptors: *State jurisdiction, *Planning, *Regulation, *Pollution, *State governments, Administrative agencies, Water pollution, Waste disposal, Land use, Natural resources, Illinois, Washington, Wisconsin, Minnesota, New York, Maine, Vermont, Maryland, Michigan.
Identifiers: *Environmental management, Judicial mechanisms.

Ways are examined in which 9 state governments have restructured organizationally in order to improve environmental protection through new regulatory powers over pollution and land use problems. Two types of reforms are covered. The first are new environmental departments created by the reorganization of existing state agencies to give pollution and resource programs an 'ecological' perspective and higher priority in state government. Programs adopted by Illinois, Washington, Wisconsin, Minnesota, and New York are analyzed. The second set of changes evaluated involve new organizations to implement state strategies for land use control, waste management and citizen action. Vermont and Maine have created agencies to regulate land development, statewide. In Maryland, the state Environmental Service has the authority to draft regional plans, finance, build, operate, and own solid and liquid waste treatment and disposal facilities, wholesaling services to local governments and industry. Michigan has given state courts a new role through the inception of public-interest lawsuits by private citizens. Criteria for evaluating public environmental institutions are developed. In accordance with these criteria, recommendations are made for a model state environmental structure. (Hoffman-North Carolina)

ENVIRONMENTAL QUALITY, THE FOURTH ANNUAL REPORT OF THE COUNCIL ON ENVIRONMENTAL QUALITY.
Council on Environmental Quality, Washington, D.C.
U.S. Government Printing Office, Washington, D.C., September 1973. 499 p, $4.30.

Descriptors: *Water pollution, *Pollution abatement, *Regulation, Institutional constraints, Governments, Federal Water Pollution Control Act, Water quality, International waters, International commissions, Earth-water interface, Public access, Great Lakes, Costs.
Identifiers: *Willamette River(Oregon), Greenway Concept, Water quality index, EPA eutrophication study, Federal Water Pollution Amendment of 1972.

Seven categories of environmental concern are covered: the urban environment; water quality improvement; economics and environmental management; law and land use regulations; federal environmental programs; international environmental programs; environmental status and trends; and the citizen's role in environmental improvement. The topic of water resources is treated both individually and in relation to economics, land use, law, and international and federal programs. The cleanup of the Willamette River in Oregon is examined as a model of the process of reversing water pollution. The effect of the clean river on land use along the river, including public access and associated recreational facilities, is also studied. The chapter on the relationship between economics and environmental policy describes four types of environmental costs of pollution and pollution control: abatement costs, avoidance costs, transaction costs, and damage costs. Judicial response to restrictions on the filling or developing of low-lying marsh and coastal lands is discussed in the context of the limitations imposed by the 'taking' clause on state and local governmental efforts to protect environmentally critical areas. The Federal Water Pollution Control Act Amendments of 1972 are summarized and analyzed. Efforts to monitor water pollution are surveyed. The pollution status of the Great Lakes and the oceans is examined. International environmental protection concerns, including protection of the oceans and control of transboundary pollution, are discussed. (Hoffman-North Carolina)

BENEFIT OF WATER POLLUTION CONTROL ON PROPERTY VALUES,
Dornbusch (David M.) and Co., Inc., San Francisco, Calif.
D. M. Dornbusch, and S. M. Barrager.
Copy available from GPO Sup Doc as EP1.23:600/5-73-005, $1.60; microfiche from NTIS as PB-228 590, $1.45. Environmental Protection Agency, Socioeconomic Studies Series Report, EPA-600/5-73-005, October 1973. 148 p, 14 fig, 15 tab, 15 ref. EPA Project 01AAB-07, Contract 68-01-0753.

Descriptors: Water quality, *Water quality control, *Economics, *Benefits, *Property values, *Regression analysis, *Pollution abatement.
Identifiers: San Diego Bay, Kanawha River(Ohio), Willamette River.

This study was undertaken to determine the current state-of-knowledge concerning the measurement of the potential benefit of water pollution control on property values, and to analyze the relationship between water quality parameters and property values at several sites where water pollution has been substantially reduced in recent years. Multiple-regression analysis and an interview technique were employed to study the relationship between residential and recreational property values and water quality components. Study sites were located on San Diego Bay and the Kanawha, Ohio, and Willamette Rivers. It was found that effective pollution abatement on badly polluted water bodies can increase the value of single-family homes situated on waterfront lots by 8 to 25 percent, and that these water quality improvements can affect property values up to 4000 feet away from the water's edge. The measurable water quality parameters which have the greatest influence on property values are dissolved oxygen concentration, fecal coliform concentrations, clarity, visual pollutants (trash and debris), toxic chemicals, and pH. Case study results were combined with a 1971 EPA water pollution survey to estimate the national benefit expressed in increased residential, recreational and rural waterfront property values, to be gained from water pollution abatement. The estimated capital value of the benefit ranges from .6 to 3.1 billion dollars, with a most likely benefit of 1.3 billion dollars. (EPA)

REVIEWING ENVIRONMENTAL IMPACT STATEMENTS-POWER PLANT COOLING SYSTEMS, ENGINEERING ASPECTS,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
Copy Available from GPO Sup Doc as EP1.23:660/2-73-016, $1.35; microfiche from NTIS as PB-228 604 $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-016, October 1973. 93 p, 12 fig, 9 tab, 60 ref. EPA Program Elements 1BA032 and 1BB392.

Descriptors: *Thermal powerplants, *Nuclear powerplants, *Environmental effects, Electric power, cost-benefit analysis, Cooling towers, *Thermal pollution, *Reviews.
Identifiers: *Environmental impact statements, *Cooling water systems.

This report describes the approach and technical base that have been used by EPA's National Thermal Pollution Research Program for reviewing those portions of Environmental Impact Statements (EIS's) relative to the engineering aspects (including economics) of cooling water systems for thermal power plants. Techniques and data are provided to enable the EIS reviewer to make sound judgements concerning the adequacy of both the cooling water system selected for the power plant and the EIS comments on that system. Literature citations are provided to direct the reviewer to additional and more detailed information. Information and discussions are provided on cooling system configuration, operation, environmental effects, and costs. Consideration is given to the intake as well as the discharge. Various closed-cycle cooling systems employing cooling towers, cooling ponds, spray systems, and other devices are covered. Methods of assessing alternative slections and benefit-cost analyses are presented. Non-thermal aspects of cooling water systems are discussed. The report lays the groundwork for a technically sound EIS review; however, the reviewer must supplement the material presented with references and perhaps technical consultation to prepare comprehensive and detailed review comments. LABORATORY STUDY OF SELF-SEALING LIMESTONE PLUGS FOR MINE OPENINGS,
NUS Corp., Pittsburgh, Pa. Cyrus Wm. Rice Div.
R. G. Penrose, Jr., and I. Holubec.
Copy Available from GPO Sup Doc as EP1.23:670/2-73-081, $2.25 microfiche from NTIS as PB-228-586. Environmental Protection Agency, Technology Series Report EPA-670/2-73-081, September 1973. 217 p, 63 fig, 114 tab, 2 ref. EPA Project 14016 JBU, Contract 68-01-0135.

Descriptors: *Limestones, *Acid mine water, *Laboratory tests, *Pilot plants, Neutralization, *Sealants, *Aggregates, Iron, Particle size, Cements, Permeability, Compressibility, Strength of materials.
Identifiers: *Mine seals, Ferrous waters, Ferric water.

Laboratory studies of self-sealing limestone plugs for mine openings were conducted to determine the optimum limestone material for such a treatment and sealant technique. Conducting a thorough study of the performance of such plugs required pilot plant operations utilizing synthetic solutions representative of anticipated acid mine waters, aggregate additives to improve plug performance, and several basic types of limestone which were varied interms of size gradation and placement density. The types of limestone used were selected from results of a previous neutralization study; synthetic mine waters were prepared to EPA formulations for ferric, ferrous, and ferrous/ferric solutions; and percentage admixture of bentonite, flyash and air-cooled blast furnace slag additives were used with the aggregate. Experimental results indicated that permeability, compressibility and strength of a limestone plug are primarily a function of the particle size distribution and density. Plug performance was most effective with high limestone placement density and smaller gradation of stone. Ferric waters were controlled most effectively. Additive effects were less significant throughout the tests. Further tests were conducted on the effects of particle size distribution variations and placement density and other additives to cement particles into an effective plug. (EPA)

STATE STANDARDS FOR TEMPERATURE, (ISSUED BY THE ENVIRONMENTAL PROTECTION AGENCY IN AUGUST 1972).
Environmental Reporter, p 33-54, 1973, 2 tab.

Descriptors: *Regulation, Governments, *Water policy, *Water temperature, Water quality control, Management, Federal government, *State governments, Interstate rivers, Thermal properties, Cooling, Thermal pollution, Legislation, Seasonal, Aquatic environment, Fish, *Water quality standards.

Excerpts from individual Federal-State water quality standards establishing temperature criteria for interstate waters have been compiled in order to provide general information to the public as well as Federal, State, and local officials. This report represents the first nationwide strategy for water quality management and reflects the major uses to be made of the water (recreation, drinking water, fish and wildlife propagation, industrial, or agricultural uses). Temperature standards are set to control thermal pollution, which may create adverse conditions for aquatic life, accelerate biological processes in the streams, reduce the dissolved oxygen content of the water or increase the growth of aquatic plants. Individual state-adopted criteria are listed with the latest revisions of standards as of the date of printing. (Jerome-Vanderbilt)

ROLE OF PHYTO- AND ZOOPLANKTON IN SELF-PURIFICATION PROCESSES (EXEMPLIFIED BY OXIDATION PONDS), (IN RUSSIAN),
Belorussian State Univ., Minsk (USSR).
N. M. Kryuchkova.
Gidrobiol Zh. Vol 8, No 5, p 106-111. 1972.
Identifiers: Metabolism, Microbial processes, *Oxidation ponds, *Phytoplankton, *Zooplankton, *Self purification.

In addition to the known value of microbiological processes, the activity of phyto- and zooplankton plays a major role in the self-purification of water bodies. The examples given show that under certain conditions phyto- and zooplankton acquire decisive significance for self-purification processes. However, in all cases this process is the general result of the activity of the entire microbial, plant, and animal population of the water body or stream.--Copyright 1973, Biological Abstracts, Inc.

ANTI-POLLUTION BARRIER,
Etablissements Hutchinson Compagnie Nationale du Caoutchouc, Paris (France)(Assignee).
G. A. Lamboley.
U.S. Patent No 3,775,982, 4 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 917, No 1, p 68, December 4, 1973.

Descriptors: *Patents, *Barriers, *Oil spills, *Oil pollution, Coasts, Tides, Waves(Water), (*Shore protection, *Pollution abatement, Water quality control, Water pollution control.

An anti-pollution barrier consists of a watertight skirt, which has floats and ballast and is connected to a tension element having tensile strength at spaced apart points defining longitudinal segments on the skirt and on the tension element. The tension element is a semi-rigid flat strip which is located roughly midway up the height of the skirt and rigidly fastened to the skit by transverse stiffening provided at the respective fastening points. To preclude a tilting of the barrier of more than 90 deg, it is desirable that a reinforcing strip constitute an auxiliary ballast opposing the raising torque. The skirt thus maintains under all circumstances a definite orientation which enables it to be used as a coastal barrier in a tidal region. (Sinha-OEIS)
W74-04705

SKIMMER TRAP,
B. H. Field.
U.S. Patent No. 3,774,767, 3 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 916, No 4, p 1360, November 27, 1973.

Descriptors: *Patents, *Skimming, Separation techniques, *Flotsam, *Pollution abatement, *Water treatment, *Water quality control.

The trap consists of an elongated buoyant tubular member having angled inner and outer ends. A water flow intercepting flat strip is affixed to the upstream side of the tubular member with the strip including a skimmer-engaging angled inner end. The corresponding inner end of the buoyant member engages the side of the pool and properly orientates the trap at a projecting 45 deg angle for an interception of the flow-impelled debris and the directing of it into the skimmer. The outer end of the buoyant member is directed upstream for a confining of the floating debris. The entire trap is stabilized and retained in position by an elongated cord-like member extending from a midpoint along the trap to a simple decorative weight positioned as desired along the pool edge. As an auxiliary aid in the gathering of the debris, an arcuate shield can be removably clipped on the tubular member. (Sinha-OEIS)
W74-04713

ANTI-POLLUTION BARGE AND CONVEYER ASSEMBLY,
J. A. Anderson.
U.S. Patent No. 3,762,558, 3 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 161, October 2, 1973.

Descriptors: *Patents, *Oil pollution, Separation techniques, Equipment, Barges, *Oil spills, *Pollution abatement, Water quality control, *Water pollution control, *Conveyance structures.

A bottom conveyer is constructed and arranged so as to be supported by the bow of a barge. It protrudes downward and forward. A top conveyer is mounted superjacent to the bottom conveyer and works with it. Each of the conveyers has an imperforate flexible endless belt. The adjacent runs of the belts are flat surfaces longitudinally and transversely of the belts. The superjacent conveyers are arranged to pick up a floating pollutant and convey it upward between adjacent runs of the respective conveyers. Transverse ribs are secured to the top conveyer and extend therefrom into liquid-tight edgewise engagement with the top run of the bottom conveyer. Longitudinal flexible wings are arranged to laterally confine the picked up pollutants and water during upward displacement thereof. The conveyers are pivoted onto the barge. The barge is provided with water ballast tanks to adjust the dipping depth of the outer end of the conveyers. (Sinha-OEIS)

Descriptors: *Flood damage, *Non-structural alternatives, *Computer programs, Optimization, Economic efficiency, *Flood control, Maximum probable flood, *Connecticut River, *Risks, *Decision making, Benefits, Costs, Model studies, Evaluation.
Identifiers: Flood proofing, Expected values.

Results are presented of the economic potential of flood proofing measures for reducing flood damages. The empirical application focuses on several communities in the Connecticut River Basin. A literature review of flood proofing measures and a treatment of decision-making under uncertainty are included. A partial equilibrium framework (model) for making flood proofing choices for various types of structures is also provided. The output of this model takes the form of expected values and standard deviations of net benefits from flood proofing. These computer results are tabulated, and some remarks are made concerning the incidence of benefits and costs of such flood damage reduction measures.

Available from National Technical Information Service as PB-227 968 $8.75 in paper copy, $1.45 in microfiche. Research Report No 65, 1973. 108 p, 9 tab, 33 ref, append. OWRR B-027-KY(2). 14-31-0001-3595.

Descriptors: *Kentucky, *Social impact, *Institutions, Planning, Assessments, Highway relocation, Law enforcement, *Local governments, Roads, Zoning, *Social change, Social values, *Taxes, Tourism, Water supply, *Land use, Land development, *Pre-impoundment, Post-impoundment, Reservoir sites, Community development.

This study of the probable sociocultural impact of a proposed reservoir in central Kentucky on the institutions of local governments of a community

adjacent to the reservoir utilizes anthropological concepts of social values and cultural and social change as well as anthropological research techniques. Data on observed impact on the same institutions in communities adjacent to two recently completed Kentucky reservoirs permit inferences as to probable directions and extent of reservoir-related change. Specific aspects of impact considered include: effects of reduction of the county tax base due to Federal acquisition of lands, including necessity for increased severity of taxes and changes in assessments, problems related to effective planning and zoning, potential benefits from development or expansion of city and county potable water supply, effects of reservoir-caused highway relocation on county roads and county road maintenance, and effects of reservoir-created tourism patterns on local law enforcement. The overall purpose is to recommend to the agency (Corps of Engineers) that is causing massive environmental change through creation of a manmade lake, improvements in policies and procedures that will increase sociocultural benefits and decrease sociocultural costs. MULTIPURPOSE RESERVOIRS AND URBAN DEVELOPMENT,
North Carolina Univ., Chapel Hill. Center for Urban and Regional Studies.
R. J. Burby, III, T. G. Donnelly, and S. F. Weiss.
Available from National Technical Information Service as PB-228 009 $3.75 in paper copy, $1.45 in microfiche. Workshop on 'Planning the Development and Use of Reservoir Shorelines in North Carolina' at Chapel Hill, North Carolina, September 21, 1972. 44 p, 8 tab, 3 fig, append. OWRR B-012-NC(12).

Descriptors: *Recreation demand, Recreation facilities, Reservoirs, *Computer models, *Land development, *Impoundments, Recreation, Model studies, Land use, Land tenure, Water resources, Rural areas, Community development, Boating, Southeast U.S., *Georgia, *North Carolina, *Urbanization, *Multiple-purpose reservoirs.
Identifiers: Second home communities, Vacation home developments, Development process, Lake Sidney Lanier(Ga.), Lake Norman(N.C.), Land development firms, Reservoir development agencies.

The development of recreational communities in rural hinterlands of metropolitan areas can cause environment and service problems for affected governmental units. This development process, initiated by a reservoir owner wishing to create a water impoundment, proceeds through a series of stages beginning with rural use and ending with seasonal or permanent residence. About 75% of lots are developed by land development firms, as seen in recreational subdivisions adjacent to Lake Norman, North Carolina, and Lake Sidney Lanier, Georgia. Various attractiveness factors motivate consumer purchases of lots, including character of the property and proximity to reservoir, friends, cities, and work. A computer model simulates these location patterns through a randomized procedure assigning households to sites according to the supply of land and its attractiveness for residential use. The model 'forecasted' 1969 patterns to compare results obtained from the simulation with actual development. Results showed more scatterization than actually occurred in these communities; more precise land use constraints could eliminate this problem. Since factors determining residential patterns in each community are unique, no general set of inputs can exist. Refinements in the model are needed, but it can still aid in anticipating problems with development in recreational communities. (Gorden-North Carolina)

ESTIMATING THE BENEFITS OF STREAM VALLEY AND OPEN SPACE PRESERVATION PROJECTS,
Regional Science Research Inst., Philadelphia, Pa.
R. E. Coughlin, and T. R. Hammer.
In: Government Spending and Land Values: Public Money and Private Gain, ed. by C. L. Harriss. University of Wisconsin Press, Madison, p 155-170, 1973. 5 fig, 2 tab.

Descriptors: *Project benefits, *Estimated benefits, Streams, *Water pollution effects, Evaluation, Analysis, Pricing, Value, *Water quality, *Pennsylvania, *Parks.
Identifiers: *Environmental quality, *Location rent gradient, Land values, Pennypack Park, *Philadelphia(Penn), Ecological benefit, Open spaces.

Benefits are estimated for environmental projects that involve maintaining the water quality of streams and keeping extensive areas of land undeveloped. Environmental values are translated into land values. Given that persons considering a residential site near some amenity are able to imagine the use and enjoyment to be derived, and that people are willing to attach some monetary value to this use and enjoyment, environmental benefit differences create a location rent gradient. A number of studies of people's response to environmental quality are summarized. Relative to the hypothesized preconditions for location rent, the studies suggest that: (1) people do not do a good job of imagining how they would make use of an amenity if they lived nearby and; (2) even those who are currently enjoying benefits of some environmental amenity may not attribute a very high monetary value to it. Implied is that environmental benefits may be undervalued and that this is reflected in location rents. Property values around Pennypack Park in Philadelphia, Penn. were used to estimate the value of location rent generated by a stream-valley park. Location rent ranged from about $1,171 per property at 40 feet from the park to $104 per property at 2,500 feet from the park. Considering that the opportunity cost of retaining the park would be $13 million, location rent is heavily underestimated. (Hoffman - North Carolina)

CAPITALIZATION OF THE BENEFITS OF WATER RESOURCE DEVELOPMENT,
Kansas Univ., Lawrence.
D. W. Daicoff.
In: Government Spending and Land Values: Public Money and Private Gain, ed. by C. L. Harriss. University of Wisconsin Press, Madison, p 189-199, 1973.

Descriptors: *Project benefits, *Water resources development, Recreation, Navigation, Flood control, *Property values, Capital.
Identifiers: *Capitalization of benefits, Property value increases.

The consequences of governmental expenditures on water resource development projects for the value of real property in terms of capitalization of benefits is considered. The present value of the expenditure-benefit augmented value stream can be found by discounting a stream of government expenditure benefits and adding them the discounted stream of private benefits. By subtraction the capitalized value of the expenditure benefit may be estimated. Several conditions, relating to the type of object or activity benefited by the public expenditure and to the specific nature of the expenditure benefits, are necessary for capitalization of water resource development projects. They are: (1) the object or activity must be salable; (2) some of the benefits must be in the future; (3) there must be some differential to be capitalized; and(4) benefits must not be shifted to another object or activity. The influence of flood control, navigation, and recreation project expenditure on the value of property is discussed. Empirical studies cited show that a portion of the benefits of water resource development projects is observable in property value. Some questions remain, though, as to the degree of capitalization and the extent to which it can be measured. (Hoffman-North Carolina)

LAND VALUE INCREMENTS AS A MEASURE OF THE NET BENEFITS OF URBAN WATER SUPPLY PROJECTS IN DEVELOPING COUNTRIES: THEORY AND MEASUREMENT,
Maxwell Graduate School of Citizenship and Public Affairs, Syracuse, N.Y. Metropolitan and Regional Research Center.
R. W. Bahl, S. P. Coelen, and J. J. Warford.
In: Government Spending and Land Values: Public Money and Private Gain, ed. by C. L. Harriss. University of Wisconsin Press, Madison, p 171-188, 1973.

Descriptors: *Water supply development, *Project benefits, *Estimated benefits, Evaluation, Regression analysis, Pricing, Value, Land development, *Water supply.
Identifiers: Water supply benefit measurement, *Land values, Control area analysis, *Developing countries.

The market for water services does not permit benefit estimation of the willingness of individuals to pay for public improvements in water. Land values can be used as an additional measure: the increased consumers' surplus area under the demand curve in the water market is transferred into an equivalent shift in area under the property market demand curve. All benefits of a water supply project not measured in renevues derived directly through sales in the water market can be measured from the consumer surplus transferred from water to property markets. Two supply and demand conditions are necessary for the land value increment to totally exhaust the benefit increment: the slope of the demand curve for housing in the project area cannot change; and the supply curve must be perfectly inelastic. Given these conditions any error in true benefits of a water supply will be on the conservative side. Three possible approaches to empirical measurement of water supply benefits are suggested: a regression model using dummy variables to indicate exogeneous factors affecting

land values; a control area analysis where the control area is expected to be similar in all respects to the project area except for the water project; and a modified, combined regression-control area model. A brief discussion of other land-value studies, as well as behavioral and institutional relationships that affect the investment-land value nexus is included. (Hoffman-North Carolina)

THE RAJASTHAN CANAL AREA: A SETTLEMENT STRUCTURE,
Delhi Univ., New Delhi (India). School of Planning and Architecture.
L. Vagale.
Urban and Rural Planning Thought, Vol 16, No 3, p 148-186, July, 1973. 15 fig, 17 tab, 18 ref.

Descriptors: Irrigation, *Irrigation programs, Irrigation systems, *Irrigation canals, *Irrigation districts, *Land use, *Canals, Land management, Water management, Land, Arable land, Distribution systems, Cultivation, Crop production, Cultivated lands, Agriculture.
Identifiers: *India(Rajasthan Canal Project), Colonization, Settlement hierarchy, Multi-level planning system, Five Year Plan.

The Rajasthan Canal Project, an irrigation plan undertaken by the Indian government, hopes to irrigate 6.7 million acres of land by distributing water through a canal network 45,341 miles long. Started in 1958, it will be implemented in two stages, but work is behind schedule. Apart from the irrigation project, planned 'colonization' must be implemented. This includes a functional hierarchy of villages linked by transportation modes, provided with the necessary infrastructure, and familiarized with new techniques of irrigation and agriculture. Population distribution patters, optimum size of land holdings, desirable crop patterns, and other factors must be considered. Basic villages, with 1200-1500 people, form the first order settlement in the hierarchy, providing basic services for the community. Central villages, with 4,000-5,000 people form the second tier, serving 4-6 villages. Market towns, with 20,000-25,000 inhabitants, form the next level and are located along major canals. The sub-regional center, with 40,000-50,000 people, is the highest order of settlement. Located along main canals, they serve 6-8 market towns, 30-40 central villages, and 140-150 basic villages. A multidisciplinary approach, including land and water use planning, is essential for this area's development. (Grden - North Carolina)

MANAGING GROWTH IN A FRAGILE ENVIRONMENT: PROBLEMS OF THE ROCKY MOUNTAIN STATES,
Colorado State Univ., Fort Collins.
E. Vlachos.
Presented at Symposium on 'Property Rights and Institutions for Achieving Public Interests in Management of Land Resources,' Annual meeting of American Association for Advancement of Science, Washington, D.C., December 26-31, 1972. 45 p, 4 fig, 1 tab. OWRR B-083-COLO(1).

Descriptors: *Planning, *Water supply, *Water demand, *Environmental effects, *Growth rates, *Rocky Mountain region, Water resources, Urban land use, Coordination, Water quality, Montana, Idaho, Wyoming, Colorado, Nevada, Arizona, Utah, New Mexico, Management, Water shortage, Water rights, Political aspects, Water requirements, Water pollution, Urbanization, Regulation.
Identifiers: Growth management, *Regulatory technique.

In the Rocky Mountain states, the limited water resources combined with the precarious physical environment are constant constraints of present and future growth in the area. Trends affecting these states are increasing population through westward migration, increasing urbanization and rural decline, increasing industrialization with new values and behavior patterns, and increasing concern with ecological mismanagement. Water shortages are expected by the year 2020 with continuing population and urban growth. Water management becomes an important means of controlling, coordinating, and allocating the existing and future rights to the use of water, and thus offers the opportunity for the achievement of larger goals of a social policy for concerted land development. Choices involved are either total use is brought into line with supply or one type of use might be sacrificed to maintain another. Use of water through federal projects for agriculture in formerly arid lands while moisture-rich areas of the country exist is increasingly questioned. Interstate rivalry for water may be expected. The future of the region depends on both augmenting the natural supplies and developing alternative means for meeting competing demands. The policy for maximizing water supplies hinges on strong incentives for efficient or new uses including economic benefits, and redefinition of the doctrine of beneficial use; structural changes such as new organizational arrangements, creation of new state agencies; and regulatory counter-incentives such as stricter enforcement and pricing policies. Other policies which can supplement water as a means of controlling growth are suggested. (Edwards-North Carolina)

6E. Water Law and Institutions

A STUDY OF WATER INSTITUTIONS IN UTAH AND THEIR INFLUENCE ON THE PLANNING, DEVELOPING, AND MANAGING OF WATER RESOURCES,
Utah Center for Water Resources Research, Logan.
F. W. Haws.
Available from National Technical Information Service as PB-227 914 $3.75 in paper copy, $1.45 in microfiche. Completion Report, Utah Water Research Laboratory Publication PRWG79-1, September 1973. 54 p, 5 fig, 3 tab, 123 ref. OWRR B-037-UTAH(1). 14-31-0001-3134-OWRR.

Descriptors: *Water policy, *Institutions, *Irrigation districts, *Management, Water allocation(Policy), Water Supply Development, Water Distribution(Applied), Political aspects, Legal aspects, Water law, *Utah, Planning, *Institutional restraints.
Identifiers: Wasatch Front(Utah), Municipal water companies, Conservancy districts, Private water companies.

The various water institutions in Utah are examined with respect to their history, purpose, legal status, organizational structure, management system, financial arrangement and service responsibility. The restraints that each type of institution has upon the overall state planning effort are identified and critically examined. Emphasis is given to those institutions in the Wasatch front area of Utah where pressures of urbanization and industrialization are increasing. Specific details are given for the mutual water companies, irrigation districts, private companies, municipal water companies, and conservancy districts in Utah and Weber Counties.

WHAT DO WE MEAN BY METROPOLITAN WATER MANAGEMENT INSTITUTIONS.,
Colorado State Univ., Fort Collins.
N. Wengert.
Water Resources Bulletin, Vol 9, No 3, p 512-521, June 1973. 24 ref. OWRR W-122(No 3183)(4).

Descriptors: Water resources, *Institutions, *Planning, *Organizations, Values, *Reviews, National Water Commission, *Institutional constraints, *Social values, *Cities, Urbanization.
Identifiers: Definition, Meaning, Institutional fragmentation, Norms, Usage, Literature review, Water resources council, Great Lakes Basin Commission.

Usages and meaning of the term 'institutions' are often unclear, and many conceptualizations exist. Among the findings of this state-of-the-art survey were that: (1) many used do not include careful definitions; (2) many users seemed unaware of the general, theoretical literature on institutions; (3) there was little consistency among uses, either in practical literature dealing with water problems, or in conceptual literature dealing with the theory of institutions; (4) some usages of the term were without significant meaning; (5) the term was often used as a king of 'black box' to account for behavioral, societal, or managerial factors recognized as being of possible relevance; (6) the term often was used as a synonym for 'organization' in the narrowest sense of administrative structure. Changes in institutions are frequently superficial unless they are related to fundamental changes in attitudes, perceptions, and expectations of the affected citizens. Institutions are not simply the current organizational pattern but include socio-political values (norms). The local water agency is not an institution, but the collectivity or structure around which are clustered the institutionalized means for planning, developing and managing water functions. A proposed definition is the structured result or outcome of a process by which values are articulated, arranged and communicated, having continuity over time, and influencing or controlling behavior of persons involved with it, who did not necessarily participate in formulating those values (norms). POTENTIAL USE OF AIRBORNE DUAL-CHANNEL INFRARED SCANNING TO DETECT MASSIVE ICE IN PERMAFROST,
Development and Resources Transportation Co., Silver Spring, Md.
L. A. LeSchack, F. H. Morse, W. R. Brinley, Jr., N. G. Ryan, and R. B. Ryan.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 542-549, 1973. 6 fig, 10 ref.

Descriptors: *Permafrost, *Frozen ground, *Ice, *Remote sensing, *Arctic, Frozen soils, Infrared radiation, Temperature, Surveys, Mapping, Aerial photography.

Remote sensing can detect the thermal effects on the surface of ice as they are manifested in the upper 2.5c3 m of permafrost. This is borne out by field work. Predawn imagery appeared to have the greatest significant information. Polygons undetected by conventional reconnaissance means are detected by IR scanning. The existence of polygons, with their associated ice wedges, may be determined with greater confidence than heretofore possible in areas of discontinuous permafrost or in areas where there is no visible surface expression. Dual-channel IR scanning offers even greater capabilities of identifying such ice masses. By obtaining a product of the two signals and mapping the resultant signal, images of polygonal structures appear to be enhanced significantly. By taking a ratio of the same two signals, imagery approaching an emissivity ratio map is produced in which the temperature function is significantly attenuated. A comparison of the product and ratio maps suggests that the polygonal structures seen are thermal anomalies and not anomalies due to surface emissivity change. (See also W74-04346) (Knapp-USGS)

CENTO SEMINAR ON THE APPLICATION OF REMOTE SENSORS IN THE DETERMINATION OF NATURAL RESOURCES.
Central Treaty Organization, Ankara (Turkey).
Proceedings of Seminar on the Application of Remote Sensors in the Determination of Natural Resources; Ankara, Turkey, November 10-13, 1971: Office of the U.S. Economic Coordinator for Central Treaty Organization Affairs, Ankara, Turkey, 1972. 179 p.

Descriptors: *Remote sensing, *Hydrology, *Water resources, Hydrogeology, Data collections, Mapping, Water resources development, Satellites(Artificial), *Natural resources.
Identifiers: *CENTO.

CENTO sponsored this Seminar on the Application of Remote Sensors in the Determination of Natural Resources. The fast, accurate, and timely acquisition of multidisciplinary data from space platforms will facilitate a better monitoring of time-dependent events such as land utilization, crop vigor, salinization, groundwater fluctuations, coastal line denudation, and erosion control. The scientific and technological communities of the CENTO region are in a position to deal effectively with the complexities of modern technology. The seminar was held in Ankara, Turkey from Wednesday, November 10 to Saturday, November 13, 1971. (See W74-04568 thru W74-04570) (Knapp-USGS)

POSSIBLE APPLICATION OF REMOTE SENSING FOR UNDERGROUND WATER EXPLORATION IN TURKEY,
State Hydraulic Works, Ankara (Turkey). Dept. of Hydrographic Mapping and Photo Geology.
N. Atuk.
In: Proceedings of CENTO Seminar on the Application of Remote Sensors in the Determination of Natural Resources; Ankara, Turkey, November 10-13, 1971: Office of the U.S. Economic Coordinator for Central Treaty Organization Affairs, p 54-56, 1972.

Descriptors: *Remote sensing, *Hydrogeology, Surveys, Mapping, Satellites(Artificial), Data collections, *Groundwater, *Exploration.
Identifiers: *Turkey.

In 1952, a small groundwater office was formed for the studies of exploration, development, control, and determination of quality and quantity of groundwater in Turkey. Groundwater investigations are made by photo interpretations to obtain hydrologic features, thus decreasing the amount of field work necessary and obtaining nearly correct data results. The remote sensing studies undertaken by NASA are of interest to Turkey. Three large regions have been selected to: (1) evaluate the utilization of data obtained from space; (2) investigate the possibility of obtaining economically important results on some interpreted problems; (3) correlate and develop the technique of interpretation from the data obtained through field work, aircraft, and satellite; (4) examine streams and submarine springs with respect to tidal phenomena or deformations occurring along seashore lines; (5) investigate and follow the change of stream meanders, boundaries of surface water, and groundwater levels, and to investigate soil, vegetation, and moisture conditions; (6) follow exposure of the vegetation cover in time; and (7) examine the matters in relation to geological problems of Turkey. (See also W74-04567) (Knapp-USGS)

OPERATIONAL AND EXPERIMENTAL REMOTE SENSING IN HYDROLOGY,
Geological Survey, Washington, D.C. Office of Remote Sensing.
M. Deutsch.
In: Proceedings of CENTO Seminar on the Application of Remote Sensors in the Determination of Natural Resources; Ankara, Turkey, November 10-13, 1971: Office of the U.S. Economic Coordinator for Central Treaty Organization Affairs, p 95-105, 1972. 11 fig, 1 tab, 6 ref.

Descriptors: *Remote sensing, *Hydrology, *Water resources, Hydrogeology, Data collections, Mapping, Water resources development, Satellites(Artificial).

Both dynamic and nondynamic hydrologic phenomena can be investigated and better understood through the use of remote-sensing techniques. Operational techniques utilizing aircraft and/or spacecraft data provide qualitative observations and quantitative measurements in three modes--spatial, temporal, and spectral. Among the operational applications of remote sensing to hydrology are flood plain mapping, location and description of geologic structures controlling groundwater movement, identification of phreatophytes, monitoring of water losses and groundwater, and thermal infrared studies. Many experimental applications of remote sensing to hydrologic phenomena have been proposed for the Earth Resources Technology Satellite. These include experiments in playa lake dynamics, determination of density and distribution of phreatophytes, flood plains and wetland mapping, and spring runoff forecasting. Such hydrologic studies will yield significant benefit to worldwide water resources management programs by providing a data base for future planning and development. (See also W74-04567) (Knapp-USGS)

National Inst. of Oceanography, Wormley (England).
G. F. Morrison.
Deep-Sea Research, Vol 20, No 7, p 665-668, July 1973. 4 fig, 1 ref.

Descriptors: *Data storage and retrieval, Salinity, Temperature, Depth, Analog computers, Electronic equipment.
Identifiers: *Tape recorders.

An inexpensive and convenient method is described for storing and retrieving frequency modulated signals in the audio frequency band. The signal is recorded on one channel of a

stereophonic tape with a crystal derived clock frequency on the other. During retrieval the clock frequency is increased in a phase locked loop and is used as an external standard for a commercial counter/timer which measures the period of the signal in terms of this reference. The system has been used to record salinity, temperature and depth data from the Plessey Environmental System instrument, and this application is discussed. (Mortland-Battelle)

MISSISSIPPIAN AQUIFER OF IOWA,
Geological Survey, Iowa City, Iowa.
P. J. Horick.
Iowa Geological Survey Miscellaneous Map Series 3, 1973. 3 sheets, 13 fig, 4 tab, 3 map, 10 ref.

Descriptors: *Hydrogeology, *Aquifers, *Iowa, *Hydrologic data, Maps, Data collections, Water quality, Water levels, Water yield, Groundwater.
Identifiers: *Mississippian aquifer(Iowa).

The purpose of this 3-sheet atlas is to present information on the occurrence, movement, availability, use, and chemical quality of water from the Mississippian aquifer in Iowa. Included is a brief description of the physical characteristics and spatial relations of the rocks that contain the water. Also discussed and evaluated are the areas of high pollution hazard to this and underlying aquifers. The Mississippian aquifer underlies about 60% of the State, but in only about 15% of this area can the aquifer be considered a major source of potable water. This area comprises all or parts of 10 counties in the north-central part of the Mississippian outcrop, where the aquifer will yield moderate to large supplies of good to excellent quality water to wells. Estimates of recharge and storage in that region indicate that many times the current withdrawal rate of about 12 mgd can be developed from the aquifer. Elsewhere, the aquifer yields either small quantities of moderately to highly mineralized water (subcrop area), or small to moderate quantities of fair to good quality water (southeast outcrop area). Additional supplies probably can be developed in both areas. Waste-disposal sites in the outcrop area of the aquifer would be best located where the glacial drift is thick or has very low permeability. A potential contamination hazard to the underlying Cambrian-Ordovician aquifer exists in the subcrop area of the Mississippian aquifer. In that area the Mississippian aquifer contains highly mineralized water. (Knapp-USGS)

THE ATLANTIC COAST OF LONG ISLAND,
Army Engineer District, New York.
F. L. Panuzio.
In: Proceedings of Eleventh Conference on Coastal Engineering, London, England, September 1968, American Society of Civil Engineers, Vol 2, Part 4, Chap 77, p 1222-1241, 1969. 7 fig, 2 tab, 15 ref, 1 plate.

Descriptors: *Sea level, *Storms, *Littoral drift, *Shore protection, *New York, Coasts, Barriers, Inlets(Waterways), *Sediment transport, *Coastal engineering, *Design criteria.
Identifiers: Long Island(NY).

The south shore of Long Island, located on the northeast coast of the United States, consists of 120 miles of headlands and barrier beach which is breached by inlets that interconnect the coastal bays with the Atlantic Ocean. The shore is subject to severe changes due to constant attack of the ocean, rising level of the ocean and severe storms. The predominant, east to west littoral drift moves from 300,000 to 600,000 cubic yards of sand along the shore annually. The affected area encompasses a million people and is valued at $2.5 billions. Improvements have been authorized for 110 miles of shore, and involve sandfill, feeder beaches, groins, jetties, sand bypassing, and inlet barriers. The estimated cost for the entire shore improvement is $188 million. The annual charges are about $10 million. The annual benefits are $16 million. The implementation of the authorized work includes the design and model testing of several sections and the completed work in several sections, such as sandfill, feeder beaches, and groins. The completed work shows considerable effect on shore processes. Overall evaluation must await completion of the total improvement in an integral section of the shore. (Sinha-OEIS)

THE SOLITARY WAVE,
R. L. Wiegel.
In: Oceanographical Engineering, Chapter 3, p 65-76, 1964. 19 fig, 24 ref. Prentise Hall, New York, Price, $24.75.

Descriptors: *Waves(Water).
Identifiers: *Solitary waves, *Cnoidal waves, *Shoaling.

The solitary wave is not oscillatory in character in that there is no reversal of flow of the water particles because it is a wave of translation; nor is there a trough, all of the wave being above the undisturbed water level. The solitary wa ve is said to be a limiting case of cnoidal wave. Explanations are given on processes in shoaling water, on reflection- the Mach-Stem effect, and finally on diffraction. (Sinha-OEIS)

WAVES IN SHOALING WATER,
R. L. Wiegel.
In: Oceanographical Engineering, Chapter 7, p 150-179, 1964. 34 fig, 41 ref. Prentise Hall, New York, NY, Price: $24.75.

Descriptors: Coasts, *Waves(Water), *Shallow water, *Refraction(Water waves), Reflection, Surf, *Shoals.
Identifiers: *Shoaling, *Breaking waves.

Following a statement on the transformation of uniform periodic waves, the transformation of irregular waves is examined. The linear least-

squared method of prediction of wave motion is reviewed. Wave refraction techniques are usually valuable in obtaining reliable quantitative information for large portions of the area under study and will give qualitative information about a complex area. Wave refraction is applied in the case of a straight shore with parallel contours, in the case of islands and shoals with concentric circular contours, and the region of a caustic. Instructions are given on the graphical construction of refraction diagrams by the wave-front method for long-crested waves, and by use of orthogonals. The advantages and disadvantages of the use of both methods are set forth. Breakers, surf and multi-crested waves, also are discussed. (Sinha-OEIS)

A REFRACTION STUDY AND PROGRAM FOR PERIODIC WAVES APPROACHING A SHORELINE, AND EXTENDING BEYOND THE BREAKING POINT,
Delaware Univ., Newark. Coll. of Marine Studies.
B. S. L. Smith, and F. E. Camfield.
Available from NTIS as AD-756 636 for $3.00 paper copy, $1.45 microfiche. Technical Report No. 16, CMS No. 2 EN-071, November 1972. 124 p, 43 fig, 7 tab, 25 ref, 6 append. ONR-N00014-69-A0407.

Descriptors: *Coasts, *Refraction(Water waves), *Waves(Water), *Shallow water, *Computer programs, Shoals, *Delaware.
Identifiers: Breaker zone, Shoaling zone, *Cape Henlopen(Del.).

The study extends the computerized wave refraction process beyong the breaking zone and over shoaling areas. It applies experimental data to the irregular conditions encountered in shoaling areas in such a way that a manageable and reliable program is achieved. This is done by means of graphical interpretation and mathematical treatment. The program was run for three conditions of wave period and a constant deep water wave height of 10 feet. The chosen direction was from the E.S.E., being one of predominant wind for the Cape Henlopen area. The program refracts successfully outside and beyond the shoaling area, and estimates reforming wave heights and wavelengths of a reasonable order. These compute all the way to the shoreline to give the wavelengths and wave heights at the beach, thus providing valuable information for design purposes. The program was also run over an artificially constructed breaker zone of exaggerated undulation, and ran successfully. Program details and results are given. (Sinha-OEIS)

MODIFICATION OF NEARSHORE CURRENTS BY COASTAL STRUCTURES,
United States Lake Survey, Detroit, Mich.
J. H. Saylor.
Available from NTIS as AD-646 820, for $6.00 paper copy, $1.45 microfiche. Miscellaneous Paper No. 66-1, June 1966. 14 p, 9 fig, 9 ref.

Descriptors: *Great Lakes, Lakes, *Coastal structures, *Harbors, *Currents(Water), *Circulation, Breakwaters, Lake Superior, Lake Erie, Lake Michigan, Shear stress, Winds, Water circulation, *Wind tides.
Identifiers: Longshore currents, Flushing, Nearshore, Wind driven currents.

The results of water current studies conducted along the shores of Lakes Superior, Michigan, and Erie are described. Studies were made at various harbor locations to establish current magnitudes and patterns within the harbors and in the adjacent coastal areas, and to relate the measured currents with the causitive forces. Current patterns measured at three harbors in which the circulation is largely controlled by currents flowing along the shores of the Great Lakes are presented. The current patterns are determined by the configuration of the breakwaters and the strength and direction of coastal flow. It appears certain that with adequate information on the nearshore-current and long-wave climates, the pattern of circulation can be forecast before construction of new or modification of existing coastal structures. This is of special importance on the Great Lakes not only to avoid adverse effects of the currents, but also to provide for adequate harbor flushing. The absence of significant astronomical tides in the lakes and the absence of other large-amplitude oscillations of water level makes interaction of the harbor with currents along the shore the most effective means of harbor flushing. The nearshore currents are driven chiefly by the shear stress of the wind, and both speed and direction of the currents are closely correlated with periods of high-energy input. The nearshore currents are certainly related to a wind-driven circulation of the entire lake basin. (Sinha-OEIS)

LABORATORY EXPERIMENTS TO DETERMINE THE STRUCTURAL RESPONSE OF A VERTICAL PILE SUBJECTED TO WIND-GENERATED WATER WAVES,
Organization Massachusetts Univ., Amherst. School of Engineering.
E. J. Chacko, and J. M. Colonell.
Available from the National Technical Information Service as AD-759703 $3.00 in paper copy, $1.45 in microfiche. Report No UM-73-4, 1973. 121 p, 61 fig, 5 tab, 36 ref, 2 append.

Descriptors: *Offshore platforms, *Oil industry, *Design criteria, *Ocean waves, Winds, Laboratory tests, Methodology, Time series analysis, Computer programs, Drilling equipment.

An investigation was undertaken to determine the structural response of a vertical cylindrical column to excitation by wind-generated water waves. Structural bending moments at two positions on the column, as well as water surface elevations near the column, were monitored continuously. The time series representations of wave heights, bending moments, and resultant wave forces on the columns (reduced from the two moment records), were analyzed with the following objectives: Evaluation of statistical assumptions which are ordinarily made for such data; and development of insight for formulation of the most realistic and/or mathematically tractable assumptions on which to base stochastic models of these processes. With reference to a Morison equation formulation of the problem, the experiments were characterized by inertia-dominated resultant wave forces on the column. Significant results include verification of a Gaussian probability model for observations of structural bending moment and resultant wave force on the column. Peak-to-peak values of bending moment and wave force were observed to follow a Rayleigh probability model within the limits imposed by most practical situations. The transfer function which related resultant wave force to the incident wind-generated wave train was observed to be essentially constant over the dominant frequency band of the wave spectrum. A procedure is suggested for relating this type of laboratory experimentation to prototype structural design. (Woodard-USGS)
W74-04424

A LABORATORY INVESTIGATION OF FREE SURFACE FLOWS OVER WAVY BEDS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
A. F. H. Yuen, and J. F. Kennedy.
Report No 121, December 1971. 43 p, 37 fig, 5 tab, 23 ref. USGS Contract No 14-08-0001-11420.

Descriptors: *Streamflow, *Sediment transport, *Channel morphology, Open channel flow, Sedimentary structures, *Hydraulic models, Flumes, Roughness(Hydraulic).

A linearized, third-order analytical model developed to predict the amplitude ratio and phase shift between bed and surface waves of free-surface flows over sinusoidal beds was verified in a hydraulic model. Near resonance the surface configuration was complicated by the formation of hydraulic jump over each bed wave, and can only be analyzed within the framework of a nonlinear model. For selected experiments the spatial distributions of velocity, total head, bed pressure, and bed shear stress were also measured. The effects of bed curvature on the distributions of these quantities are discussed in the light of the findings of investigation of flow in wavy-walled pipes. The form of the velocity distribution varied widely along each wave, but conformed over much of the depth to the power law; an expression for the exponent in the velocity distribution relation was derived from energy and continuity considerations. HYDRAULIC PERFORMANCE OF BRIDGES EXCAVATIONS AT BRIDGES,
Geological Survey, Jackson, Miss.
B. E. Colson, and K. V. Wilson.
Mississippi State Highway Department Report MSHD-RD-73-015-EB, September 1973. 37 p, 1 fig, 5 tab, 3 ref.

Descriptors: *Discharge(Water), *Scour, *Flood plains, Stage-discharge relations, *Mississippi, Open channel flow, Flow around objects, Hydraulic design, *Excavation, Alluvial channel, *Bridges.
Identifiers: Flow constrictions.

Excavation under bridges as a means of increasing their hydraulic capacity was studied by observing the stage and discharge through five bridge openings across a single flood plain. Three of the bridges had total downstream areas larger than the areas under the bridges before excavation, and increases in hydraulic capacity were indicated. The fourth bridge had a downstream subarea larger than the excavated areas near the abutments, and an increase in hydraulic capacity was also indicated. One bridge had a restricted area just downstream which acted as the control area, and no increase in hydraulic capacity was indicated. In one bridge, the maximum effective area is equal to the minimum area measured along the upstream to downstream perimeter of the excavation. After excavation, velocities were less uniform and were greater near the bottom than at the surface. (Knapp-USGS)

GALVESTON BAY HURRICANE SURGE STUDY: REPORT 2. EFFECTS OF PROPOSED BARRIERS ON TIDES, CURRENTS, SALINITIES, AND DYE DISPERSION FOR NORMAL TIDE CONDITIONS--APPENDIX B: CALIBRATION TESTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
R. A. Sager, and E. C. McNair, Jr.
Technical Report H-69-12, Report 2, Append B, March 1973. 41 p, 10 photo, 18 plate.

Descriptors: *Hydraulic models, *Harbors, *Texas, *Hurricanes, Coastal engineering, Shore protection, Surges, Flood protection.
Identifiers: *Galveston Bay.

A model test program was conducted to evaluate two proposed hurricane protection systems for Galveston Bay, Texas. Model structures allow the effects of two barrier plans on normal tide conditions to be evaluated in a distorted-scale model (1:60 vertically and 1:600 horizontally). A model structure of a 400-ft-wide by 55 ft navigation opening was developed for each plan. Model structures of a total of 108 60-ft-wide tidal passages varying in depth from -10 to -40 ft msl were developed for the one plan and a total of 160 60-ft-wide tidal passages at depths of -6 and -12 ft msl were developed for another plan. WAVE ACTION AND BREAKWATER DESIGN, HAMLIN BEACH HARBOR, NEW YORK,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
C. W. Brasfeild.
Available from NTIS, Springfield, Va 22151 as AD-766 738, Price $3.00 printed copy, $1.45 microfiche. Technical Report H-73-13, August 1973. 34 p, 4 fig, 6 plate, 7 photo, 1 tab, 5 ref.

Descriptors: *Harbors, *Lake Ontario, *New York, *Breakwaters, *Hydraulic models, Waves(Water), Coastal engineering.

A hydraulic model investigation was made of proposed harbor facilities at Hamlin Beach State Park, Lake Ontario, New York, to determine the most economical breakwater arrangement consistent with the provision of satisfactory entrance conditions and adequate protection to moored boats within the harbor. A wave machine and electrical wave height measuring and recording apparatus were utilized in model operation. The breakwater proposed for the west side of the entrance channel could be reduced in length by 100 ft without sacrificing the full protection desired for the entrance and inner harbor, and a reduction in length of another 100 ft would not seriously impair the desired protection. (Knapp-USGS)
W74-04588

AN ANALYTICAL STUDY OF A COILED-PIPE HEAT SINK,
Cold Regions Research and Engineering Lab., Hanover, N.H.
A. Zehnder, Y. C. Yen, R. E. Perham, and W. F. Quinn.
Special Report 195, November 1973. 33 p, 10 fig, 5 tab, 4 ref, append.

Descriptors: *Cryology, *Heat exchangers, *Heat transfer, *Waste disposal, Thermodynamics, Soil physics, Geothermal studies.
Identifiers: *Heat sinks.

An analytical study was conducted to determine the practicality of using a buried closed-loop, small-diameter coiled-pipe heat sink instead of a reservoir-type sink for emergency disposal of waste heat. The analysis was broadly based to permit application to a variety of soil types, mean ground temperatures, heat rejection rates, coolant water flow rates, pipe sizes, coil surface areas and coil spacings. The intent of the study was to present a problem-solving technique that would be useful to a design engineer faced with considering the use of a buried coiled pipe to dissipate a rather large amount of heat to the ground during a very limited period. The feasibility of such a system was found to be highly dependent upon the length of pipe required and the installation layout requirements for such a pipe network. (Knapp-USGS)

STUDY OF BEACH WIDENING BY THE PERCHED BEACH CONCEPT, SANTA MONICA BAY, CALIFORNIA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. E. Catham, Jr., D. D. Davidson, and R. W. Whalin.
Technical Report H-73-8, June 1973. 47 p, 10 fig, 17 tab, 24 photo, 14 plate, 20 ref, append.

Descriptors: *Beach erosion, *Coastal engineering, *California, *Hydraulic models, Shore protection.
Identifiers: *Santa Monica Bay(Calif).

Hydraulic model studies of beach erosion were conducted to aid in determining the technical feasibility and optimum design factors of the perched beach concept for widening the existing beach to provide right-of-way for a freeway along a portion of the Santa Monica Bay coastline. An undistorted, three-dimensional, fixed-bed model (scale 1:100) was used to determine the effect of the perched beach on rip currents. A distorted-scale (1:100 horizontal, 1:50 vertical), two-dimensional, movable-bed model was used to estimate the amount of sand which might be lost seaward over the toe structure due to normal and storm wave actions and to determine the optimum crown elevation of the submerged structure and the length of stone riprap apron required to reduce the seaward migration of sand to a minimum. An undistorted, two-dimensional model (scale 1:30) was used to determine the structural design of the proposed rubble-mound toe structure for various depths. Installation of the perched beach in the model had no adverse effect on rip currents and reduced rip current velocities about 20% for the configuration tested. Normal wave action (waves expected to occur a high percentage of the time) on the perched beach will cause no appreciable loss of beach fill. For the larger storm waves of any significant duration, a large net seaward loss of fill material can be expected. (Knapp-USGS)

Descriptors: *Waves(Water), *Channels, *Shallow water.
Identifiers: *Wave steepness, Wave frequencies, *Wave reflection, Wave transmission.

Reflection and transmission phenomena were investigated in a laboratory channel for transitions of linearly varying depth and/or width terminating in channels of reduced cross-section. Upstream wave characteristics were varied from deep to shallow water waves by changing wave frequencies, amplitudes and channel depths over a wide spectrum of conditions. Experimental values were corrected to correspond to transmission in an endless channel. The reflection and transmission coefficients are given as functions of the pertinent dimensionless parameters such as group velocity ratio, channel depth ratio and wave steepness. Associated wave energies were also evaluated. (Sinha - OEIS)

CONVECTIVE HEAT TRANSFER TO WATER CONTAINING BUBBLES: ENHANCEMENT NOT DEPENDENT ON THERMOCAPILLARITY,
Oxford Univ. (England). Dept. of Engineering Science.
D. B. R. Kenning, and Y. S. Kao.
International Journal of Heat and Mass Transfer, Vol 15, No 9, p 1709-1716, 1972, 10 fig, 11 ref.

Descriptors: Fluid mechanics, *Entrainment, *Heat transfer, *Shear, *Capillary action, *Water temperature, Hydraulics, Flow, Liquids, Gases, Boundary layers, Surface tension, Reynolds number, Laboratory tests, Data collection, Heat flux, Surfactants, Vortices, Turbulence.
Identifiers: *Thermocapillary flows.

Improvements in the heat-transfer coefficient of up to 50% occurred in the presence of small quantities of gas but the improvements were independent of heat flux over a range of 20-300 KW/square meter, indicating that thermocapillary flows made negligible contribution to the heat transfer process. Experiments were performed in which the surface tension of water in the apparatus remained within 0.2 degrees/cm of the value for pure water. An upstream injection of gas bubbles also increased the heat transfer coefficient by up to 50%. The increase depends on the gas flow rate and liquid phase Reynolds number but not on heat flux. A possible mechanism for the increase is secondary flow production by the interaction of bubbles with shear flow near the wall. (Jerome-Vanderbilt)

ANALYTICAL METHODS OF SOLUTION OF CONJUGATED PROBLEMS IN CONVECTIVE HEAT TRANSFER,
Akademiya Navuk BSSR, Minsk. Inst. of Heat and Mass Transfer.
A. V. Luikov, V. A. Aleksashenko, and A. A. Aleksashenko.
International Journal of Heat and Mass Transfer, Vol 14, No 8, p 1047-1056, 1971. 2 fig, 14 ref.

Descriptors: *Heat transfer, Fluids, *Model studies, *Thermodynamic behavior, *Fluid mechanics, Hydraulics, Convection, Flow, Heat flow, Mathematical models, Thermal conductivity, Dimensional analysis, Water temperature.

A method for solution of convective heat transfer problems is presented. The method takes into account the heat propagation in the solid in contact with a moving fluid. This method is referred to as the solution of conjugated problems. The heat transfer in laminar fluid flow in circular and planar tubes was treated with allowance for dissipation of mechanical energy. In addition, both steady and unsteady-state heat transfer problems for flow of a compressible fluid past a plate are considered. In all cases heat transfer in the fluid is discussed in relation to the heat transfer in the solid wall. On the basis of the analysis of the solution a new criterion is introduced which characterizes the effect of thermo-physical properties of the wall on heat transfer. Examples are used for illustration of the proposed method. (Jerome-Vanderbilt)

FLOATING BREAKWATER PONTOON,
Reid, Middleton and Associates, Inc., Edmonds, Wash.; and Poly Sintering, Inc., Seattle, Wash. (Assignees).
J. O. Olsen, and G. A. Visser.
U.S. Patent No. 3,777,689, 4 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 917, No 2, p 514, December 11, 1973.

Descriptors: *Patents, *Shore protection, *Breakwaters, *Waves(Water), *Beach erosion, Pontoons, Hydraulic structures.
Identifiers: *Wave action.

A rectangular floating structure having a grid pattern of walls and openings is formed from a nested array of uniquely shaped molded plastic pontoon modules. The modules are thin walled molded plastic hollow pontoons comprising an upper portion with a recess to allow for nesting the pontoons in position with other similar pontoons, a rectangular center pollution with protuberant end sections, and protuberant side sections extending outward from the central portion perpendicular to the end sections. When nested, the modules collectively form a grid pattern of rectangular openings extending into the upper portion of the wave to dissipate wave action. (Sinha-OEIS)

WAVES GENERATED BY HORIZONTAL MOTION OF A WALL,
Army Coastal Engineering Research Center, Washington, D.C.
M. M. Das, and R. L. Wiegel.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 98, No WW1, Proceedings paper 8707, p 49-65, February 1972. 11 fig, 1 tab, 13 ref, 2 append.

Descriptors: *Faults(Geologic), *Landslides, *Earthquakes, *Waves(Water).
Identifiers: Surface waves, Wall motion, Linearized solutions, *Wall displacement, Solitary waves.

The purpose is to determine the range of conditions for which the theoretical calculations of Noda based upon linear wave theory may be useful to the design engineer for the problem of surface waves generated by a vertical wall moving horizontally through water. Emphasis is on the problem of surface waves generated by a horizontal tectonic displacement of a portion of an underwater escarpment due to the strike fault movement of a fault oriented approximately normal to the escarpment. Also discussed is the problem of predicting water waves generated by landslides into water, which may occur either vertically, inclined at an angle, or even horizontally over a portion of their travel. Also described is the problem of waves generated in a reservoir by the horizontal motion of a dam during an earthquake. The regions of wave characteristics indicated by Noda for the box drop problem approximately describe the gross characteristics of the waves generated in the range of experiments performed for the wall-motion problem. The linearized solution appears to be in reasonable agreement with experimental results for fairly small values of wall displacement (but not for the smallest values) and velocity. The predictions of the maximum elevation of the leading wave of the nonlinear waves by using the linearized solutions appear to be useful, provided the value is calculated for $x^* = 5$. APPLICATION OF THE FINITE ELEMENT METHOD TO CONVECTION HEAT TRANSFER BETWEEN PARALLEL PLANES,
New South Wales Univ., Kensington (Australia).
A. O. Tay, and G. De Vahl Davis.
International Journal of Heat and Mass Transfer, Vol 14, No 8, p 1057-1069, 1971.

Descriptors: *Fluid mechanics, *Heat transfer, *Mass transfer, *Laminar flow, Hydraulics, Flow, Turbulence, Temperature, Thermal properties, Distribution, Hydrodynamics, Model studies, Mathematical models, Convection.
Identifiers: *Heat flux, Nusselt number.

Physical problems of the Poisson equation type have been solved numerically by the finite element method. Few attempts have been made to apply this method to problems involving transport phenomena. A problem of a fluid of constant properties flowing in steady, laminar motion between two infinite stationary parallel planes is considered. A determination of the temperature distribution and the axial variation of the local Nusselt number is made. The flow is hydrodynamically developed. The validity of the method is verified and some aspects of the method discussed. (Jerome-Vanderbilt)

BREEDER REACTORS: POWER FOR THE FUTURE,
A. L. Hammond.
Science, Vol 174, No 4011, p 807-809, November 19, 1971. 1 fig.

Descriptors: *Breeder reactors, *Nuclear reactors, *Fuels, Electric powerplants, Nuclear powerplants, Nuclear energy, Nuclear engineering, Thermal powerplants, Cooling water, Uranium radioisotopes.
Identifiers: *Sodium cooling, Plutonium, Thorium, Uranium.

Breeder reactors are so called because they produce more fuel than they consume. The prototypes are already in operation in France, Britain, and U.S.S.R. The attractiveness of breeder reactors lies in their ability to utilize thorium and the more naturally abundant form of juranium (238 U), which results in substantially lower fuel costs. The primary effort both in the United States and elsewhere is concentrated in a fast breeder design that will use liquid sodium as a coolant and heat transfer medium and a plutonium oxide as a fuel. AEC is also investigating a thermal breeder reactor that would be moderated with water. (Oleszkiewicz-Vanderbilt)

VISCOELASTIC PROPERTIES OF FROZEN SOIL UNDER VIBRATORY LOADS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
H. W. Stevens.
In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973, p 400-409, 1973. 11 fig, 1 tab, 11 ref.

Descriptors: *Soil strength, *Rheology, *Permafrost, *Viscosity, *Frozen soils, Porosity, Ice, Plasticity.
Identifiers: Viscoelastic properties of soils.

The viscoelastic properties of frozen soil may be determined by subjecting a cylinder of the soil to steady-state vibration and measuring the resonant frequency and amplitude ratio. Using the mass density and the length of the cylinder and applying linear viscoelastic theory and boundary conditions, the desired parameters can be evaluated. The modulus of saturated frozen soils decreases with increasing void ratio. The maximum modulus for a given saturated soil depends on its minimum void ratio and the soil type. The degree of ice saturation has maximum effect on the modulus, as maximum modulus occurs with 100% saturation and minimum modulus occurs when no ice is contained in the voids or a nonfrozen dry state. The modulus of frozen soil is about two orders of magnitude greater than the modulus of the same soil in the nonfrozen state. The damping coefficient is approximately equal to or slightly higher for frozen soil than for nonfrozen soil. The modulus of frozen soil decreases with increasing temperature, but the rate is small until temperature is higher than about -4 deg C. From -4 to 0 deg C, the rate of decrease of modulus sharply increases. (See also W74-04346) (Knapp-USGS)

ENGINEERING DESIGN AND CONSTRUCTION IN PERMAFROST REGIONS: A REVIEW,
Cold Regions Research and Engineering Lab., Hanover, N.H.
K. A. Linell, and G. H. Johnston.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 553-575, 1973. 190 ref.

Descriptors: *Permafrost, *Construction, *Reviews, *Design, Land use, Environment, *Cold weather construction, Cold regions, Arctic, Dam construction, Engineering, Road construction, Civil engineering, Excavation, Subsidence, Frost heaving, Soil mechanics, *Bibliographies.

In North America, development of the permafrost regions is advancing at a rapidly accelerating rate. This creates increasingly intense pressure to formulate engineering design and construction principles. Proper selection and investigation of a site or route for construction is important. Full-scale field tests are necessary. Design to insure preservation of the permafrost is the most commonly used approach for permanent construction. Spread footings, continuous footings, raft or mat foundations, or post and pad construction have been successfully used on thaw-unstable as well as thaw-stable permafrost. Thermal control usually consists of either a simple ventilation space between the structure and the ground surface or of duct systems. Construction of anchorages is difficult because of creep, thermal instability, and frost heave. Foundations for bridges or for port construction are difficult problems because the permafrost conditions are altered near and under the water. Significant laboratory and field work has been done over the past decade to investigate methods of penetration, excavation, and handling of frozen ground and ice, including frozen ore, and of underground construction. In very cold permafrost areas it is feasible to construct dams with permanent reservoir water storage, even with relatively pervious embankment materials, because seepage is sealed off by freezing of the embankment. It is within the technological state of the art to develop and make available the petroleum resources of land areas of the Arctic with acceptably low environmental impact. THERMAL REGIME IN AN ARCTIC EARTHFILL DAM,
Cold Regions Research and Engineering Lab., Hanover, N.H.
C. W. Fulwider.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 622-628, 1973. 7 fig, 1 tab, 1 ref.

Descriptors: *Dams, *Dam design, *Permafrost, *Arctic, *Earth Dams, Dam construction, Freezing, Water storage, Water temperature.
Identifiers: *Greenland.

The Crescent Lake Dam is an earthfill embankment constructed near Thule Air Base, Grenland, to impound a dependable water supply for the base. It is one of very few such structures in the Arctic or Subarctic. The design of the dam was based on the premise that the soil in the central part of the embankment would remain frozen throughout the year, creating an impervious core section, and that the water surface elevation would remain below the top of the frozen portion of the dam. Two winters were required to establish a stable thermal regime in the original 3.6-m dam and about the same after increasing embankment height by about 2.4 m, although in both instances thawing beneath the crest was limited to about 1.8 m after only one winter. The limiting height for complete freezeback in one winter is in excess of 3.6 m, and perhaps as much as 6 m. For an earthfill dam of greater height, it is probable that construction in stages, over several years, would be necessary to ensure dependable natural freezeback of the core section if it is desired to achieve this freezeback before water is impounded. ANALYSIS OF THE PROPOSED LITTLE CHENA RIVER, EARTHFILLED NONRETENTION DAM, FAIRBANKS, ALASKA,
Corps of Engineers, Anchorage, Alaska.
W. George.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 638-648, 1973. 9 fig, 2 tab, 9 ref.

Descriptors: *Dams, *Dam design, *Permafrost, *Alaska, Dam construction, Thawing, Subsidence, Arctic, Flood control, Water storage, Water temperature, Earth dams.

A dam near Fairbanks, Alaska, will be located in an area in which the permafrost temperature is more marginal than that existing in the areas where such structures have been previously built with permafrost preservation in mind. The same requiremens exist, however, to protect the permafrost and, in fact, these are even more of a concern. Because of its use for temporary storage, a moderation and, in fact, control of the heat absorption into the dam from these impounded waters will result. This controlled and limited heat input is an important factor in even considering the design and construction proposed. Conservative calculations show that there exists more than a margin of safety from the heat input from such temporary and infrequent impoundments when balanced against heat loss. The more frequent floods will normally be of the spring snowmelt type with water temperature quite cold and the duration of the impoundment quite short. The less frequent flood, where water temperatures may be somewhat higher, will not be a problem. (See also W74-04346) (Knapp-USGS)

PERMAFROST-RELATED ENGINEERING GEOLOGY PROBLEMS POSED BY THE TRANS-ALASKA PIPELINE,
Geological Survey, Menlo Park, Calif.
R. Kachadoorian, and O. J. Ferrians, Jr.
In: International Conference on Permafrost 2nd, Yakutsk, USSR 1973. p 684-687, 1973. 1 fig, 11 ref.

Descriptors: *Permafrost, *Pipelines, *Alaska, *Arctic, *Oil fields, Frozen ground, Frozen soils, Subsidence, Frost heaving, Thawing, Freezing.

The design, construction, and maintenance of the proposed trans-Alaska pipeline system in the permafrost region of Alaska poses special engineering problems. The severity of problems resulting from soil instability, differential settlement, and erosion of thawed soil depends on the type and ice content of the soil and the slope and drainage conditions. Soil instability, differential settlement, erosion, and disrupted surface and subsurface drainage can result in loss of support and rupture of the pipe. Consequently, the effects of thawing permafrost and of erosion must first be determined and then minimized or controlled by proper design, proper arctic and subarctic construction procedures, and an adequate monitoring system. Some potential effects are so serious that contingency plans must be devised. These actions are necessary in order to maintain the mechanical integrity of the pipeline and to avoid degradation of the adjacent terrain. (See also W74-04346) (Knapp-USGS)

In: International Conference on Permafrost 2nd, Yakutsk, USSR, 1973. p 759-766, 1973. 7 fig, 3 tab, 7 ref.

Descriptors: *Permafrost, *Pipelines, *Oil fields, *Thawing, *Subsidence, Frost heaving, Freezing, Arctic, *Canada.

To study the behavior of permafrost as a foundation material for a warm-oil pipeline, a 27-m test section of 0.61-m-diameter pipe was installed near Inuvik, N.W.T. The surrounding foundation material (ice-rich silty clay) was thawed by circulating oil at 71 deg C. During thawing of the foundation, excess pore pressures were recorded. In the upper layers, two of three piezometers indicated that the pore pressures dissipated rapidly. At greater depths, pore pressure rose to a maximum value and remained nearly constant during the testing period. Although the values of excess pore pressures are small, hydraulic gradient was developed at depth. Settlement measurements show variability over short distances. However, the amount of settlement was predicted within practical accuracy by using average values obtained from laboratory thaw-settlement tests. For the test section, oil was circulated at 71 deg C from the start of the test, whereas for the pipeline a buildup from 38 to 60 deg C in 5 years is proposed. Under full-scale operation, the slower heat buildup would result in lower pore pressures and slower settlement rates. (See also W74-04346) (Knapp-USGS)

THE USE OF POLYURETHANE FOAM PLASTICS IN THE CONSTRUCTION OF EXPEDIENT ROADS ON PERMAFROST IN CENTRAL ALASKA,
Cold Regions Research and Engineering Lab., Hanover, N.H.
N. Smith, R. Berg, and L. Muller.
In: International Conference on Permafrost, 2nd, Yakutsk, USSR, 1973. p 736-745, 1973. 10 fig, 4 tab, 1 ref.

Descriptors: *Permafrost, *Road construction, *Arctic, *Insulation, Thermal insulation, Frost heaving, Thawing, *Plastics, *Alaska.
Identifiers: Polyurethane foam.

In the cold regions of the world, seasonally and permanently frozen soils present severe road construction and maintenance problems during winter and the thawing period. The use of as much as 1.0-3.0 m of granular materials to minimize or prevent deleterious freezing and thawing actions is common practice. In general, for expedient roads designed for short lives, such as those required for lumbering, mining and oil explorations, and military operations, this method is too time consuming; also, many areas lack sufficient quantities of granular materials for this practice. Road test sections incorporating foamed in-place polyurethane insulation of two densities were tested over a subgrade containing seasonally and permanently frozen high-moisture-content silt. On permafrost terrain similar to central Alaska, 10 cm of foam insulation is sufficient thickness to withstand 1,000 passes of a loaded dump truck having a maximum single wheel load of 2,415 kg. Additional use as an access road for lumbering, mining, and oil explorations, and military operations with wheel loads up to 5,000 kg could be handled for a minimum of one thaw season. Wood chips as a leveling course provided some insulation advantage over the gravel leveling course of approximately equal thickness. (See also W74-04346) (Knapp-USGS)

CONDUIT STRUCTURE FOR MIGRATIN FISH,
J. E. Raistakka.
U.S. Patent No. 3,772,891, 3 p, 7 fig, 5 ref; Offici Gazette of the United States Patent Office, V 916, No 3, p 857-858, November 20, 1973.

Descriptors: *Patents, *Fish migration, *Fi passages, *Conveyance structures, Engineeri structures, Dams, *Fish barriers, Migration *Conduits.

Migrating fish may circumvent a dam by use of conduit enabling their passage upstream a downstream. The conduit terminates in segmer projecting in a submerged manner outward in the river; the segments are flexible to a degree permit vertical positioning of the conduit ends f optimum fish ingress and egress. It is closed fr the atmosphere to prevent the addition of nitrog to the water passing through the conduit. A co stant gradient and constant flow facilitate fi passage. Spaced along the conduit are series

flow disrupting projections which cause the water to form areas of eddying water currents providing resting areas for the fish. Fish attracting substances are fed into the conduit water to help overcome the natural tendency of fish to shy away from the entry of the conduit. (Sinha-OEIS)

PINK AND CHUM SALMON CULTURE,
Oregon State Univ., Corvallis.
W. J. McNeil.
Available from NTIS, Springfield, Va. 22151 COM-72-11056 for $3.00 printed copy; $1.45 microfiche. Completion Report to NOAA, National Marine Fisheries Service, July 1970. 4 p, 3 photo. AFC-43.

Discriptors: *Fish hatcheries, *Oregon, Fish handling facilities, *Pink salmon, *Chum salmon, Fish management.
Identifiers: *Netarts Bay(Oreg).

A prototype pink and chum salmon hatchery is being tested at Netarts Bay, Oregon, by Oregon State University working in cooperation with the National Science Foundation's Sea Grant Program, the Fish Commission of Oregon, and the U.S. Bureau of Commercial Fisheries. The hatchery is designed to simulate conditions in a good quality natural spawning bed to produce robust fry which retain natural behavioral traits. In theory, the hatchery offers the promise of using very small coastal streams as a water source, streams which provide insufficient water for spwaning channels. The prototype hatchery consists of wooden hatchery tanks with water upwelling across a bed of crushed rock at velocities ranging from 20 to 40 inches per hour. Fertilized eggs are placed on screened trays which overlie the crushed rock. Lids exclude light. Excess water overflows through drains to provide fry a pathway from the hatchery tanks. The fry leave voluntarily and swim about 150 feet through raceways to reach Netarts Bay. (Knapp-USGS)

9. MANPOWER, GRANTS AND FACILITIES

9A. Education (Extramural)

TENTH YEAR ANNUAL REPORT, CENTER FOR RESEARCH IN WATER RESOURCES, UNIVERSITY OF TEXAS AT AUSTIN.
Texas Univ., Austin. Center for Research in Water Resources.
(CRWR News, Vol 9, No 4), September 1973. 27 p.

Descriptors: *Universities, *Texas, *Water Resources Research Act, Colleges, Grants, Contracts, Research and development, Laboratories, Research facilities, *Education, *Training, Optimum development plans, Systems analysis, Regional analysis.
Identifiers: University of Texas.

The Center for Research in Water Resources (CRWR) was established in the spring of 1963 to facilitate interdisciplinary programs of water resources research in engineering, in biological, physical and social sciences, and in law. CRWR seeks to fulfill these goals: to serve higher education, and other institutions, in the process by which skilled people will become available to serve using agencies; to provide a regional center of expertise and a repository of knowledge for use in research, education, practical projects, planning, and design; to serve public interests in the conservation, development, and use of water resources, particularly assisting planning and regulatory bodies at local, state, regional, and federal levels; and to make available to business and industry the services of advanced research. The main thrust of research for this fiscal year (1974) is analyzing and evaluating optimum management techniques of regional water systems, and environmental system analysis. (Knapp-USGS)

9D. Grants, Contracts, and Research Act Allotments

FEDERAL WATER RESOURCES RESEARCH PROGRAM FOR 1971.
National Science Foundation, Washington, D.C. Science and Technology Policy Office.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $1.70. Publication NSF 73-400, 1973. 134 p, 3 tab, 2 append.

Descriptors: *Water resources research act, *Research and development, Federal government, Conferences.
Identifiers: *Committee on Water Resources Research.

This report of the Committee on Water Resources Research of the Federal Council for Science and Technology is the Committee's periodic statement on the state of water resources research in the Federal Government. Each agency of government with a water resources research program is reported on individually. This report also presents the usual summaries of the total water resources research effort in the Government under the 10 categories developed previously by this Committee. (Knapp-USGS)

Performance of a Warm-Oil Pipeline Buried in Permafrost,
W74-04423 8D

Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario,
W74-04478 5B

Application of the Concept of Rectilinear Vortices to the Movement of Oil Slicks,
W74-04490 5B

Radio Depth-Sounding on Meighen and Barnes Ice Caps, Arctic Canada,
W74-04571 2C

The Effect of Collecting Time and Grain Size on the Sampling of Stream Sediments for Geochemical Mapping in the St. Catharines Area, Ontario,
W74-04587 2J

Heterotrophic Utilization of Sucrose in an Artificially Enriched Lake,
W74-04781 5C

Measurement of Adenosine Triphosphate (ATP) in Two Precambrian Shield Lakes of Northwestern Ontario,
W74-04782 5B

Diurnal Variation of Dissolved Inorganic Carbon and its Use in Estimating Primary Production and CO2 Invasion in Lake 227,
W74-04784 5A

Distribution and Uptake of Artificially Introduced Radium-226 in a Small Lake,
W74-04785 5B

Production of Epilithiphyton in Two Lakes of the Experimental Lakes Area, Northwestern Ontario,
W74-04787 5C

A Syringe Gas-Stripping Procedure for Gas-Chromatographic Determination of Dissolved Inorganic and Organic Carbon in Fresh Water and Carbonates in Sediments,
W74-04788 5A

Eutrophication of Lake 227 by Addition of Phosphate and Nitrate: The Second, Third, and Fourth Years of Enrichment, 1970, 1971, and 1972,
W74-04789 5C

CANADA (QUEEN CHARLOTTE SOUND)
Reproduction of Estuarine Structure and Current Observation Techniques in the Hecate Model,
W74-04724 2L

CANALS
The Rajasthan Canal Area: A Settlement Structure,
W74-04499 6D

Effects of Backpumping from South New River Canal at Pump Station S-9 on Quality of Water in Water-Conservation Area 3, Broward County, Florida,
W74-04600 5B

CAPE HENLOPEN (DEL
A Refraction Study and Program for Periodic Waves Approaching a Shoreline, and Extending Beyond the Breaking Point,
W74-04340 8B

CAPILLARY ACTION
Convective Heat Transfer to Water Containing Bubbles: Enhancement not Dependent on Thermocapillarity,
W74-04664 8B

CAPITALIZATION OF BENEFITS
Capitalization of the Benefits of Water Resource Development,
W74-04501 6B

CARBON
Diurnal Variation of Dissolved Inorganic Carbon and its Use in Estimating Primary Production and CO2 Invasion in Lake 227,
W74-04784 5A

A Numerical Model for Determining Integral Primary Production and Its Application to Lake Michigan,
W74-04786 5C

Production of Epilithiphyton in Two Lakes of the Experimental Lakes Area, Northwestern Ontario,
W74-04787 5C

Eutrophication of Lake 227 by Addition of Phosphate and Nitrate: The Second, Third, and Fourth Years of Enrichment, 1970, 1971, and 1972,
W74-04789 5C

CARBONACEOUS WASTES
Method and Apparatus for the Biological Treatment of Waste Water,
W74-04709 5D

CARP
Thermal Responses in Cirrhina mrigala Fry,
W74-04661 5C

CARP FEEDING
Feeding of Juvenile Carp Cyprinus carpio L. in the Arakum Bodies of Water (Delta of the Terek River) at Early Developmental Stages, (In Russian),
W74-04649 2L

CASPIAN SEA
Water Level Fluctuations of the Caspian Sea (K probleme urovennogo rezhima Kaspiyskogo morya),
W74-04575 2H

CATION ADSORPTION
Aspects of Colour Removal from Pulp and Paper Mill Effluents,
W74-04514 5D

CATION EXCHANGE
Mercury Removal from Waste Water with Starch Xanthate-Cationic Polymer Complex,
W74-04541 5D

CATIONS
Color of Pulp Industry Waste Liquors. III. The Interaction of Chloro-Oxylignin with Metal Salts (In Japanese),
W74-04512 5D

CELLULOSE ACETATE MEMBRANE
Water Cleaning Treatment,
W74-04710 3A

CENTO
Cento Seminar on the Application of Remote Sensors in the Determination of natural Resources.
W74-04567 7B

CESIUM
Annual Consumption of Cesium-137 and Cobalt-60 Labeled Pine Seeds by Small Mammals in an Oak-Hickory Forest,
W74-04450 5B

Strontium-90 and Cesium-137 Levels in Soils of Various Types at Niigata Prefecture, Japan,
W74-04453 5B

CHANNEL MORPHOLOGY
A Laboratory Investigation of Free Surface Flows Over Wavy Beds,
W74-04477 8B

CHANNELS
Wave Reflection and Transmission in Channels of Variable Section,
W74-04614 8B

CHAOBORID
Benthic Fauna of a Tropical Man-Made Lake (Volta Lake, Ghana 1965-1968),
W74-04636 2H

CHEMCONTROL
Application of Polyacrylamide to Pulp Mill Effluents (In Japanese),
W74-04529 5D

Hydrogen Peroxide for Industrial Pollution Control,
W74-04532 5D

CHEMICAL ANALYSIS
Chemical Quality of Streams, Allegheny River Basin and Part of the Lake Erie Basin, New York,
W74-04593 2K

Analytical Techniques for the Determination of Petroleum Contamination in Marine Organisms,
W74-04594 5A

CHEMICAL INDUSTRY
Water Pollution in the Netherlands,
W74-04536 5B

CHEMICAL PRECIPITATION
Extensive Effluent Treatment at Hodge Includes Color Removal.
W74-04525 5D

Clarification Method of Polluted Water from Paper Mills With Combination of Beer Effluent (In Japanese),
W74-04528 5D

Mercury Removal from Waste Water with Starch Xanthate-Cationic Polymer Complex,
W74-04541 5D

CHEMICAL WASTES
Catalytic Oxidation and Thermal Treatment of Waste Waters (Kataliticheskoe okislenie i termicheskoe obezvrezhivanie stochnykh vod),
W74-04537 5D

CHEMICALS
Pollutant Removal Handbook,
W74-04527 5D

CHESAPEAKE BAY
Temperature Acclimation in the Medusa, Chrysaora quinquecirrha,
W74-04660 5C

CHINA
Trans-Pacific Fallout and Protective Countermeasures,
W74-04454 5B

CHIRONOMIDAE
Feeding of Juvenile Carp Cyprinus carpio L. in the Arakum Bodies of Water (Delta of the Terek River) at Early Developmental Stages, (In Russian),
W74-04649 2L

CHIRONOMIDS
Benthic Fauna of a Tropical Man-Made Lake (Volta Lake, Ghana 1965-1968),
W74-04636 2H

CHIRONOMUS SPP
Chironomidae (Diptera) from the Area of Freiburg in Breisgau (with Special Consideration of the Genus Chironomus), (In German),
W74-04678 2H

CHLORELLA
Subglacial Development of Chlorella in Baikal, (In Russian),
W74-04647 2H

CHLORIDES
Availability of Ground Water in the Winnsboro Area, Louisiana,
W74-04596 4B

CHLORINATED HYDROCARBON PESTICIDES
A Preliminary Survey of the Possible Contamination of Lake Nakuru in Kenya with Some Metals and Chlorinated Hydrocarbon Pesticides,
W74-04547 5C

CHLORINATION
Hypochlorination of Polluted Storm-Water Pumpage at New Orleans,
W74-04676 5D

Water Purification,
W74-04706 5F

CHLOROPHYLL
Hydrocarbon and Chlorophyll: A Correlation in the Upwelling Region off West Africa,
W74-04771 5B

CHLOROPHYTA
A Possible Explanation for the Differences in the Fatty Acid Composition of Fresh-Water and Marine Fishes,
W74-04688 5C

CHROMATOGRAPHIC ANALYSIS
Thin-Layer and Gas-Chromatographic Determination of Phenols Present in Water, (In German),
W74-04684 5A

CHROMATOGRAPHY
Analytical Techniques for the Determination of Petroleum Contamination in Marine Organisms,
W74-04594 5A

CHROMIUM
Determination of Chromium in Sea Water by Atomic Absorption Spectrometry,
W74-04516 5A

CHRYSOPHYTA
Phytoplankton Dynamics in the Severskiy Donets River for the First Years After its Regulation, (In Russina),
W74-04648 5C

CHUM SALMON
Pink and Chum Salmon Culture,
W74-04797 8I

CIRCULATION
Modification of Nearshore Currents by Coastal Structures,
W74-04341 8B

The Possibility of Predicting Longshore Currents in Tideless Seas,
W74-04439 2J

An Annotated Bibliography of Flushing and Dispersion in Tidal Waters,
W74-04731 2L

New Dimensions in Estuary Classification,
W74-04735 2L

CITIES
What Do We Mean by Metropolitan Water Management Institutions.,
W74-04498 6E

CLADOCERA
Feeding of Juvenile Carp Cyprinus carpio L. in the Arakum Bodies of Water (Delta of the Terek River) at Early Developmental Stages, (In Russian),
W74-04649 2L

CLASSIFICATION
A Numerical Classification of Selected Landslides of the Debris Slide-Avalanche-Flow Type,
W74-04591 2J

CLAY
Influences of Soil Density, Clay Silt and Humus Content on Measurements of Soil Water by Neutron Gauges, (In German),
W74-04556 2G

CLAYS
Quickclays as Products of Glacial Action: A New Approach to Their Nature, Geology, Distribution and Geotechnical Properties,
W74-04590 2G

CLIMATE
Feasibility Study for a Surge-Action Model of Monterey Harbor, California,
W74-04721 2L

CLIMATIC CHANGE
World Desertification: Cause and Effect. A Literature Review and Annotated Bibliography,
W74-04461 3B

CLIMATOLOGY
Summary Report of Metromex Studies, 1971-1972.
W74-04509 2B

CLOSTRIDIUM-BOTULINUM
A Find of Marsh Sandpiper Tringa stagnatilis in the Netherlands,
W74-04681 5C

CLOUD PHYSICS
Summary Report of Metromex Studies, 1971-1972.
W74-04509 2B

Electric Cloud and Weather Modification with Intense Relativistic Electron Beams,
W74-04604 3B

CNOIDAL WAVE THEORY
Shallow Water Waves: A Comparison of Theories and Experiments,
W74-04609 2E

CNOIDAL WAVES
The Solitary Wave,
W74-04326 8B

COAGULANTS
Color Removal from Textile Dye Waste by Coagulation,
W74-04303 5D

COAGULATION
Color Removal from Textile Dye Waste by Coagulation,
W74-04303 5D

Application of Polyacrylamide to Pulp Mill Effluents (In Japanese),
W74-04529 5D

Papermill Treatment Plant for Small Industry.
W74-04534 5D

Process for Purifying Water that Contains Organic Matter,
W74-04716 5D

COASTAL ENGINEERING
Study of Beach Widening By the Perched Beach Concept, Santa Monica Bay, California,
W74-04603 8B

Field Investigation Practices of Coastal Studies in Japan,
W74-04625 2L

The Atlantic Coast of Long Island,
W74-04626 8A

Selected Bibliography on Beach Features and Related Nearshore Processes.
W74-04728 2J

COASTAL STRUCTURES
Mean Direction of Waves and of Wave Energy,
W74-04328 2J

Mechanical Bypassing of Littoral Drift at Inlets,
W74-04337 2L

Modification of Nearshore Currents by Coastal Structures,
W74-04341 8B

COASTAL VEGETATION
Coastal-Water Vegetation of the Lower Reaches of the Dnestr (In Russian),
W74-04813 2L

COASTS
Harmonic Generation of Shallow Water Waves Over Topography,
W74-04323 2E

Mean Direction of Waves and of Wave Energy,
W74-04328 2J

A Review of Oceanographic Variables and Their Analyses and Predictions Over the Continental Shelf,
W74-04329 2L

Mechanical Bypassing of Littoral Drift at Inlets,
W74-04337 2L

A Refraction Study and Program for Periodic Waves Approaching a Shoreline, and Extending Beyond the Breaking Point,
W74-04340 8B

Waves at Camp Pendleton, California,
W74-04607 2E

Hyperbolic Waves and Their Shoaling,
W74-04611 2E

Field Investigation Practices of Coastal Studies in Japan,
W74-04625 2L

Feasibility Study for a Surge-Action Model of Monterey Harbor, California,
W74-04721 2L

Shore Transport. Formation of Sand Spits and Tombolos,
W74-04722 2J

Research in the Coastal and Oceanic Environment. A Summary of Research Accomplished Under Project Themis,
W74-04732 2L

COBALT
Annual Consumption of Cesium-137 and Cobalt-60 Labeled Pine Seeds by Small Mammals in an Oak-Hickory Forest,
W74-04450 5B

COHO SALMON
Bioassay Procedures to Evaluate Acute Toxicity of Neutralized Bleached Kraft Pulp Mill Effluent to Pacific Salmon,
W74-04779 5C

COLD REGIONS
Water Supply and Waste Disposal Concepts Applicable in Permafrost Regions,
W74-04405 5D

COLD WEATHER CONSTRUCTION
Engineering Design and Construction in Permafrost Regions: A Review,
W74-04404 8D

COLOR
Color of Pulp Industry Waste Liquors. III. The Interaction of Chloro-Oxylignin with Metal Salts (In Japanese),
W74-04512 5D

Aspects of Colour Removal from Pulp and Paper Mill Effluents,
W74-04514 5D

Extensive Effluent Treatment at Hodge Includes Color Removal.
W74-04525 5D

COLOR REMOVAL
Color Removal from Textile Dye Waste by Coagulation,
W74-04303 5D

COLORADO
Permafrost and Its Relationship to Other Environmental Parameters in a Midlatitude, High-Altitude Setting, Front Range, Colorado Rocky Mountains,
W74-04357 2C

Lakes in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W74-04496 2H

COLORIMETRIC ANALYSIS
Determination of Microgram Quantities of Polyethylene Polyamines in Water, (In Russian),
W74-04701 5A

COLUMBIA RIVER
Boise Cascade Paper Mill and St. Helens Share Treatment Lagoon.
W74-04535 5D

Phenomena Affecting Improvement of the Lower Columbia Estuary and Entrance,
W74-04763 2L

COMMERCIAL DEVELOPMENT
Death of the Marshes in the Ardennes,
W74-04686 4A

COMMITTEE ON WATER RESOURCES RESEARCH
Federal Water Resources Research Program for 1971.
W74-04848 9D

COMPREHENSIVE PLANNING
Syracuse Metropolitan Area Comprehensive Plan-Water and Sewer Plan and Services Allocation Plan,
W74-04507 5D

COMPRESSIBILITY
Mechanical Properties of Frozen Ground Under High Pressure,
W74-04375 2C

COMPUTER MODELS
Multipurpose Reservoirs and Urban Development,
W74-04319 6B

Mathematical Modeling for Status Prediction and Control of Water Distribution Systems,
W74-04320 4A

COMPUTER PROGRAMS
Complete Listing of Program Described in Optimal Operation of Multi-Reservoir Water Resources Systems,
W74-04315 4A

A Refraction Study and Program for Periodic Waves Approaching a Shoreline, and Extending Beyond the Breaking Point,
W74-04340 8B

A General Solution for the Two-Dimensional, Transient Heat Conduction Problem in Permafrost, Using Implicit, Finite Difference Methods,
W74-04350 2C

Flood Proofing Decisions Under Uncertainty: An Application to the Connecticut River Basin,
W74-04463 6A

A Numerical Classification of Selected Landslides of the Debris Slide-Avalanche-Flow Type,
W74-04591 2J

A Numerical Model for Determining Integral Primary Production and Its Application to Lake Michigan,
W74-04786 5C

Identification of Bacteria by Computer: Theory and Programming,
W74-04791 5A

CONDUCTION
A General Solution for the Two-Dimensional, Transient Heat Conduction Problem in Permafrost, Using Implicit, Finite Difference Methods,
W74-04350 2C

CONDUITS
Conduit Structure for Migrating Fish,
W74-04715 8I

CONFERENCES
Permafrost: North American Contribution to Second International Conference.
W74-04346 2C

CONJUNCTIVE USE
A Design Procedure for the Conjunctive Use of Surface and Groundwater Storages,
W74-04598 4B

The Operation of a Stream-Aquifer System Under Stochastic Demands,
W74-04808 4B

CONNECTICUT RIVER
Flood Proofing Decisions Under Uncertainty: An Application to the Connecticut River Basin,
W74-04463 6A

Papermill Treatment Plant for Small Industry.
W74-04534 5D

CONSOLIDATION
Thaw Consolidation of Alaskan Silts and Granular Soils,
W74-04379 2C

Practical Extensions to a Theory of Consolidation for Thawing Soils,
W74-04384 2C

CONSTRUCTION
Engineering Design and Construction in Permafrost Regions: A Review,
W74-04404 8D

CONSTRUCTION COSTS
A Sewage-Treatment Concept for Permafrost Areas,
W74-04419 5D

CONTINENTAL SHELF
A Review of Oceanographic Variables and Their Analyses and Predictions Over the Continental Shelf,
W74-04329 2L

Modification of Wave Spectra on the Continental Shelf and in the Surf Zone,
W74-04762 2L

CONTROL SYSTEMS
Mathematical Modeling for Status Prediction and Control of Water Distribution Systems,
W74-04320 4A

CONVEYANCE STRUCTURES
Conduit Structure for Migrating Fish,
W74-04715 8I

Anti-Pollution Barge and Conveyer Assembly,
W74-04718 5G

COOLING WATER
Heat - A Growing Water Pollution Problem,
W74-04668 5B

COOLING WATER SYSTEMS
Reviewing Environmental Impact Statements-Power Plant Cooling Systems, Engineering Aspects,
W74-04555 5G

COPEPODA
Feeding of Juvenile Carp Cyprinus carpio L. in the Arakum Bodies of Water (Delta of the Terek River) at Early Developmental Stages, (In Russian),
W74-04649 2L

COPPER
A Preliminary Survey of the Possible Contamination of Lake Nakuru in Kenya with Some Metals and Chlorinated Hydrocarbon Pesticides,
W74-04547 5C

Effects of Cadmium and Copper on the Oxidation of Lactate by Rainbow Trout (Salmo gairdnert) Gills,
W74-04780 5C

COPPER IONS
Effects of Toxicants on Brackish-Water Phytoplankton Assimilation,
W74-04644 5C

CORE DRILLING
Investigation of Sampling Perennially Frozen Alluvial Gravel by Core Drilling,
W74-04402 2C

CORIOLIS FORCE
The Fallacy of Baer's Law or Coriolis' Effect on the Meandering of Rivers,
W74-04799 8B

CORN
Effect of Light Intensity on the Quality and Feeding Effectiveness of Green Fodder, (In Russian),
W74-04821 3F

CORN (FIELD)
A Study on the Depth of Basic Tillage and Soil Fertilization for Maize Grown Under Irrigation, (In Bulgarian),
W74-04828 3F

Comparative Testing of Short-Term Wheat Monoculture, (In Bulgarian),
W74-04831 3F

New Contributions to Biological Study of Genetic Transmission of Resistance to Dryness in Double Hybrids of Zea Mays,
W74-04833 3F

CORROSION
Water Reuse and Deposits Control,
W74-04520 5D

COST ANALYSIS
Study of Pulp and Paper Industry's Effluent Treatment.
W74-04538 5D

COST-BENEFIT ANALYSIS
State-of-Art Review: Water Pollution Control Benefits and Costs, Vol I,
W74-04464 5G

Research Needs and Priorities: Water Pollution Control Benefits and Costs, Vol. II,
W74-04465 5G

Allocation of Funding for Wastewater Treatment Facilities,
W74-04562 5D

Cost-Benefit Analysis of Irrigation Projects in Northeastern Brazil,
W74-04565 3F

COST COMPARISON
State-of-Art Review: Water Pollution Control Benefits and Costs, Vol I,
W74-04464 5G

COST COMPARISONS
Research Needs and Priorities: Water Pollution Control Benefits and Costs, Vol. II,
W74-04465 5G

COTTON
Role of Soil Conditions in the Development of Moths, (In Russian),
W74-04640 3F

Drought Resistance of Radiation-Induced Mutant Varieties and Parent Forms of Cotton, (In Russian),
W74-04822 3F

The Effect of Water Spraying on the Reinforcement of Physiological Process in Cotton Plants,
W74-04823 3F

Water Consumption and Biological Coefficient of Furrow and Sprinkler Irrigated Cotton, (In Bulgarian),
W74-04824 3F

Results of Trials with Tobacco and Cotton Rotations Under Irrigation, (In Bulgarian),
W74-04825 3F

CREEP
Evaluation of in Situ Creep Properties of Frozen Soils with the Pressuremeter,
W74-04377 2C

CROP PRODUCTION
Productivity and Grain Qualities of Certain Newly Developed Native and Foreign Wheat Varieties Grown Under Irrigation, (In Bulgarian),
W74-04832 3F

CROP ROTATION
Results of Trials with Tobacco and Cotton Rotations Under Irrigation, (In Bulgarian),
W74-04825 3F

Comparative Testing of Short-Term Wheat Monoculture, (In Bulgarian),
W74-04831 3F

CROP SELECTION
Cost-Benefit Analysis of Irrigation Projects in Northeastern Brazil,
W74-04565 3F

CROPS RESISTANCE (DRYNESS)
New Contributions to Biological Study of Genetic Transmission of Resistance to Dryness in Double Hybrids of Zea Mays,
W74-04833 3F

CROPS YIELD
Effect of Fertilizers and Irrigation Conditions on Yield, Chemical Composition, Baking Qualities of Winter Wheat Grain of Bezostaya 1 Cultivar, (In Russian),
W74-04830 3F

CRUCIANS (SIBERIAN)
Sex Cycle, Spawning and Fertility of West Siberian Crucians in the Steppe Lakes, (In Russian),
W74-04689 2H

CRUSTING (SOILS)
Soil Crusting Related to Sprinkler Intensity,
W74-04560 3F

CRYOLOGY
Shock-Wave Studies of Ice and Two Frozen Soils,
W74-04378 2C

An Analytical Study of a Coiled-Pipe Heat Sink,
W74-04589 8B

CRYSTAL GROWTH
Experimental Pressure Studies on Frost Heave Mechanisms and the Growth-Fusion Behavior of Ice,
W74-04385 2C

CTENOPHARYNGODON-IDELLA
Parasite Fauna of Ctenopharyngodon idella from Pond- and Spawning-Nursery Fisheries in the Volga Delta, (In Russian),
W74-04702 8I

CULTURES
Relative Efficiency of Cell Cultures for Detection of Viruses,
W74-04767 5A

The Direct Enumeration of Escherichia coli in Water Using Macconkey's Agar at 44 C in Plastic Pouches,
W74-04768 5A

CULTURING VESSELS
A Bacteriological Pressure-Retaining Deep-Sea Sampler and Culture Vessel,
W74-04773 5A

CULVERTS
Control of Culvert Icing,
W74-04411 4C

CURRENTS (WATER)
Growth of Longshore Currents Downstream of a Surf-Zone Barrier,
W74-04324 2J

Mixing Processes,
W74-04327 5B

Littoral Transport in the Great Lakes,
W74-04334 2J

Modification of Nearshore Currents by Coastal Structures,
W74-04341 8B

Currents at Harbor Beach, Michigan,
W74-04342 5B

Estuarine Currents and Tidal Streams,
W74-04344 2L

Dynamics and Morphology of Sea Coasts.
W74-04425 2J

Littoral Drift as Function of Waves and Current,
W74-04623 2J

Hydraulic Model Experiment on the Duffusion Due to the Coastal Current,
W74-04628 5B

Use of a Computational Model for Two-Dimensional Tidal Flow,
W74-04631 2L

Shore Transport. Formation of Sand Spits and Tombolos,
W74-04722 2J

Reproduction of Estuarine Structure and Current Observation Techniques in the Hecate Model,
W74-04724 2L

Selected Bibliography on Beach Features and Related Nearshore Processes.
W74-04728 2J

An Annotated Bibliography of Flushing and Dispersion in Tidal Waters,
W74-04731 2L

Research in the Coastal and Oceanic Environment. A Summary of Research Accomplished Under Project Themis,
W74-04732 2L

Rhomboid Ripple Mark, Indicator of Current Direction and Environment,
W74-04739 2J

Flume Experiments on Sand Transport by Waves and Currents,
W74-04746 2L

Longshore Currents in One and Multi-Bar Profiles Relation to Littoral Drift,
W74-04749 2L

Rhythmic Pattern of Longshore Bars Related to Sediment Characteristics,
W74-04750 2J

Laboratory Applications of Radioisotopic Tracers to Follow Beach Sediments,
W74-04751 2J

Some Characteristics of the Dutch Coast,
W74-04754 2J

Wave Interaction and Langmuir Circulations,
W74-04844 2H

A Field Study of Langmuir Circulations,
W74-04845 2H

CYANIDES
Hydrogen Peroxide for Industrial Pollution Control,
W74-04532 5D

Effects of Toxicants on Brackish-Water Phytoplankton Assimilation,
W74-04644 5C

CYANOPHYCEA
Comparative Study, in 1966 and 1967, of Three Reservoirs in the Project of a Natural Park in the Morvan Region (In French),
W74-04815 5C

CYANOPHYTA
Concerning Large-Scale Cultivation of Thermophilic Cosmopolitan Mastigocladus Laminousus Cohn (Cyanophyta) in Icelandic Hot Springs,
W74-04486 2I

Calculation of the Concentration of the Biomass of Blue-Green Algae During Settling, (In Russian),
W74-04645 5C

Phytoplankton Dynamics in the Severskiy Donets River for the First Years After its Regulation, (In Russina),
W74-04648 5C

A Possible Explanation for the Differences in the Fatty Acid Composition of Fresh-Water and Marine Fishes,
W74-04688 5C

CYCLING NUTRIENTS
Movements of Phosphorus Between its Biologically Important Forms in Lake Water,
W74-04783 5B

The Transport of Organic Carbon to Organisms Living in the Deep Oceans,
W74-04790 5C

CYTOMEGALOVIRUSES
Relative Efficiency of Cell Cultures for Detection of Viruses,
W74-04767 5A

CZECHOSLOVAKIA (LIPINO RESERVOIR)
Relation Between the Amount of Net Zooplankton and the Depth of Station in Shallow Lipno Reservoir,
W74-04680 5C

CZECHOSLOVAKIA (LIPNO RESERVOIR)
Horizontal Distribution of Some Chemical and Physical Characteristics in Lipno Reservoir,
W74-04814 5C

DAILY DIET
Daily Diet and Rate of Feeding of Notothenia rossi marmorata Fischer and Dissostichus eleginoides Smitt, Family Nototheniidae, in the Area of Southern Georgia (USSR), (In Russian),
W74-04679 2I

DALLAS (TEX)
Effects of Urbanization on Floods in the Dallas, Texas, Metropolitan Area,
W74-04483 4C

DAM DESIGN
Thermal Regime in an Arctic Earthfill Dam,
W74-04410 8D

Analysis of the Proposed Little Chena River, Earthfilled Nonretention Dam, Fairbanks, Alaska,
W74-04412 8D

DAMS
Thermal Regime in an Arctic Earthfill Dam,
W74-04410 8D

Analysis of the Proposed Little Chena River, Earthfilled Nonretention Dam, Fairbanks, Alaska,
W74-04412 8D

DARCY'S LAW
Studies on the Validity of Darcy's Law for Flow in Natural Sands,
W74-04307 2F

DARTERS
Hybridization Between the Darters Percina crassa roanoka and Percina oxyrhyncha (Percidae, Etheostomatini), with Comments on the Distribution of Percina crassa roanoka in New River,
W74-04472 2E

DATA COLLECTIONS
Groundwater Investigation and Management in Iran,
W74-04569 7B

Ground-Water Data for Harris County, Texas: Volume I. Drillers' Logs of Wells, 1905-71.
W74-04602 4B

Water Quality Records for the Hubbard Creek Watershed, Texas, October 1969-September 1972,
W74-04606 5B

Hydrologic Data for Small Rural Catchments in Australia, 1973,
W74-04842 2E

DATA INTERPRETATION
Hydrocarbon and Chlorophyll: A Correlation in the Upwelling Region off West Africa,
W74-04771 5B

DATA STORAGE AND RETRIEVAL
An Inexpensive S.T.D. Data Logging System,
W74-04772 7C

DEBRIS AVALANCHES
A Numerical Classification of Selected Landslides of the Debris Slide-Avalanche-Flow Type,
W74-04591 2J

DECISION MAKING
Flood Proofing Decisions Under Uncertainty: An Application to the Connecticut River Basin,
W74-04463 6A

DEEP SEA SAMPLER
A Bacteriological Pressure-Retaining Deep-Sea Sampler and Culture Vessel,
W74-04773 5A

DEGRADATION (SLOPE)
Rates of Mass Wasting in the Ruby Range, Yukon Territory,
W74-04371 2J

Control of Permafrost Degradation Beneath a Roadway by Subgrade Insulation,
W74-04409 4C

Slope Development on a Mississippi River Bluff in Historic Time,
W74-04585 2J

DEICERS
Control of Culvert Icing,
W74-04411 4C

DELAWARE
A Refraction Study and Program for Periodic Waves Approaching a Shoreline, and Extending Beyond the Breaking Point,
W74-04340 8B

DELTAS
Some Results of Regional Coastal Investigations in the USSR,
W74-04426 2J

History of the Formation of the Coasts of Kara-Bogaz-Gol,
W74-04427 2J

DEMINERALIZATION
Water Cleaning Treatment,
W74-04710 3A

DENSITY
Viscosity Measurements of Water in Region of Its Maximum Density,
W74-04518 2K

Comments on Veronis' Paper, 'On Properties of Seawater Defined by Temperature, Salinity, and Pressure',
W74-04658 2K

DENSITY CURRENTS
Estuarine Currents and Tidal Streams,
W74-04344 2L

DEPOSITION (SEDIMENTS)
Some Data on the Post-Glacial Evolution of Karkinit Bay and the Accumulation of Bottom Sediments Within it,
W74-04429 2J

Some Data on the Post-Glacial Transgression of the Bering Sea,
W74-04431 2J

DESALINATION
Solar Distillation Apparatus,
W74-04720 3A

DESERTIFICATION
World Desertification: Cause and Effect. A Literature Review and Annotated Bibliography,
W74-04461 3B

DESERTS
World Desertification: Cause and Effect. A Literature Review and Annotated Bibliography,
W74-04461 3B

DESIGN
Engineering Design and Construction in Permafrost Regions: A Review,
W74-04404 8D

DESIGN CRITERIA
Laboratory Experiments to Determine the Structural Response of a Vertical Pile Subjected to Wind-Generated Water Waves,
W74-04424 8B

The Atlantic Coast of Long Island,
W74-04626 8A

Economic Power from Geothermal Heat,
W74-04766 4B

Suspended and Bedload Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W74-04846 2J

DESIGN STORM
Approaches to Stormwater Management,
W74-04458 5A

DESNA RIVER BED
Effect of the Forest on the Displacement of the Desna River Bed and the Significance of this Effect on Forest Planting in the Floodplain, (In Russian),
W74-04641 4A

DETECTION RESERVOIRS
Approaches to Stormwater Management,
W74-04458 5A

DETRITUS
Distribution and Uptake of Artificially Introduced Radium-226 in a Small Lake,
W74-04785 5B

DEVELOPING COUNTRIES
Land Value Increments as a Measure of the Net Benefits of Urban Water Supply Projects in Developing Countries: Theory and Measurement,
W74-04502 6B

DEVON ISLAND (CANADA)
Accumulation on the Devon Island Ice Cap, Northwest Territories, Canada,
W74-04325 2C

DEWATERING
Gravity Dewatering: Application to Paper Mill Wastes,
W74-04533 5D

DIFFUSION
Multi-Dimensional Aspects of Eddy Diffusion Determined by Dye Diffusion Experiments in Coastal Waters (Summary),
W74-04322 2L

A Study of Diffusion in an Estuary,
W74-04333 5B

Simulation of Horizontal Turbulent Diffusion of Particles Under Waves,
W74-04624 2J

DIFFUSIVITY
Measurement of Moisture Diffusivity of Wet Swelling Systems,
W74-04493 2G

DIPTERA
Chironomidae (Diptera) from the Area of Freiburg in Breisgau (with Special Consideration of the Genus Chironomus), (In German),
W74-04678 2H

DIRECT ENUMERATION
The Direct Enumeration of Escherichia coli in Water Using Macconkey's Agar at 44 C in Plastic Pouches,
W74-04768 5A

DISCHARGE (WATER)
Hydraulic Performance of Bridges--Excavations at Bridges,
W74-04482 8B

Paleohydrology and Sedimentology of Lake Missoula Flooding in Eastern Washington,
W74-04599 2E

The Application of Numerical Simulation Models in the Assessment of the Effect of Discharges into Coastal Waters,
W74-04674 5B

The Calculation of Critical Discharge Velocity of Streams in Uniform Flow and the Transported Sediment Size,
W74-04800 2J

The Problem of Critical Discharge in Sediment Motion,
W74-04801 2J

DISINFECTION
Lime Disinfection of Sewage Bacteria at Low Temperature.
W74-04548 5D

Hypochlorination of Polluted Storm-Water Pumpage at New Orleans,
W74-04676 5D

DISPARITIES
Syracuse Metropolitan Area Comprehensive Plan-Water and Sewer Plan and Services Allocation Plan,
W74-04507 5D

DISPERSION
A Study of Diffusion in an Estuary,
W74-04333 5B

An Annotated Bibliography of Flushing and Dispersion in Tidal Waters,
W74-04731 2L

DISSOLVED GASES
Apparatus for Treating Waste Fluids by Means of Dissolved Gases,
W74-04719 5D

DISSOLVED INORGANIC CARBON
A Syringe Gas-Stripping Procedure for Gas-Chromatographic Determination of Dissolved Inorganic and Organic Carbon in Fresh Water and Carbonates in Sediments,
W74-04788 5A

DISSOLVED ORGANIC CARBON
A Syringe Gas-Stripping Procedure for Gas-Chromatographic Determination of Dissolved Inorganic and Organic Carbon in Fresh Water and Carbonates in Sediments,
W74-04788 5A

DISSOLVED OXYGEN
Water Quality Requirements of Aquatic Insects,
W74-04551 5C

Effects of Backpumping from South New River Canal at Pump Station S-9 on Quality of Water in Water-Conservation Area 3, Broward County, Florida,
W74-04600 5B

DISSOLVED PHOSPHORUS
Movements of Phosphorus Between its Biologically Important Forms in Lake Water,
W74-04783 5B

DISSOSTICHUS-ELEGINOIDES
Daily Diet and Rate of Feeding of Notothenia rossi marmorata Fischer and Dissostichus eleginoides Smitt, Family Notothenidae, in the Area of Southern Georgia (USSR), (In Russian),
W74-04679 2I

DISTRIBUTION
Distribution of Organic Matter and Bacteria in the Upper Layer of Bottom Deposit of Lake Balaton,
W74-04839 5B

DISTRIBUTION PATTERNS
The Preferred Temperature of Fish and Their Midsummer Distribution in Temperate Lakes and Streams,
W74-04666 5C

Mercury Uptake and Ion Distribution in Gills of Rainbow Trout (Salmo gairdneri): Tissue Scans with an Electron Microprobe,
W74-04778 5A

The Transport of Organic Carbon to Organisms Living in the Deep Oceans,
W74-04790 5C

Types of Distribution Pattern Among Freshwater Animals, (In Rumanian),
W74-04840 2I

DISTRIBUTION (VERTICAL)
Vertical Distribution of Zoobenthos of the Mountain River of Adzhar ASSR (In Russian),
W74-04818 2I

DISTRICT OF COLUMBIA
An Assessment of the Use of Potomac Estuary Waters and AWT Effluents for Emergency Water Supply,
W74-04506 5D

Evaluation of the Use of Pricing as a Tool for Conserving Water,
W74-04810 3D

DIVERSION
Nutrient Income Change Related to Plankton Algae,
W74-04318 5C

DOMESTIC WASTES
Apparatus for Treating Industrial and Domestic Waste Waters,
W74-04707 5D

DRAINAGE
Control of Culvert Icing,
W74-04411 4C

Death of the Marshes in the Ardennes,
W74-04686 4A

A Study on the Accuracy of Runoff Analysis for Pumping Drainage in Paddy Field Area (In Japanese),
W74-04811 4A

Effects of Flooding and Draining and Their Alternation on the Growth and Uptake of Nutrients by Rice (Oryza Sativa L., Indica Var. IR-8),
W74-04826 3F

DRAINAGE SYSTEMS
Topology of River Systems and Hydrographic Indicator Studies (Topologiya rechnykh sistem i gidrograficheskiye indikatsionnyye issledovaniya),
W74-04578 2A

DRILLERS LOGS
Ground-Water Data for Harris County, Texas: Volume I. Drillers' Logs of Wells, 1905-71.
W74-04602 4B

DRILLING FLUIDS
Investigation of Sampling Perennially Frozen Alluvial Gravel by Core Drilling,
W74-04402 2C

DROUGHT
Drought and Supplementary Feeding of Sheep in the Karoo,
W74-04834 3F

DROUGHT RESISTANCE
Changes in Enzymes in the Plant as Related to Water Supply and Usage,
W74-04306 2I

Drought Resistance of Radiation-Induced Mutant Varieties and Parent Forms of Cotton, (In Russian),
W74-04822 3F

DROUGHTS
World Desertification: Cause and Effect. A Literature Review and Annotated Bibliography,
W74-04461 3B

DUNES
The Role of Eolian Processes in the Dynamics of a Shallow Accumulation Coast,
W74-04440 2J

Eolian Cross-Bedding in the Beach Dune Environment, Sapelo Island, Georgia,
W74-04737 2J

Development and Geologic Significance of Soft Beach Sand,
W74-04757 2J

DYE DISPERSION
Multi-Dimensional Aspects of Eddy Diffusion Determined by Dye Diffusion Experiments in Coastal Waters (Summary),
W74-04322 2L

DYNAMIC PROGRAMMING
Optimal Operation of Multi-Reservoir Water Resources Systems,
W74-04314 4A

Complete Listing of Program Described in Optimal Operation of Multi-Reservoir Water Resources Systems,
W74-04315 4A

Application of Dynamic Programming in Markov Chains to the Evaluation of Water Quality in Irrigation,
W74-04561 3C

A Design Procedure for the Conjunctive Use of Surface and Groundwater Storages,
W74-04598 4B

E

The Direct Enumeration of Escherichia coli in Water Using Macconkey's Agar at 44 C in Plastic Pouches,
W74-04768 5A

EARTH DAMS
Thermal Regime in an Arctic Earthfill Dam,
W74-04410 8D

EARTHQUAKES
Prediction of the 1972 Managua, Nicaragua Earthquake from Groundwater Changes, Inferred Probability of Earthquakes in the City of Managua, Nicaragua, during the Summer of 1973,
W74-04467 2

Waves Generated by Horizontal Motion of a Wall,
W74-04760 8B

ECOLOGICAL DISTRIBUTION
Ecodistribution of Plutonium in Liquid Waste Disposal Areas at Los Alamos,
W74-04443 5B

ECOLOGY
Ecodistribution of Plutonium in Liquid Waste Disposal Areas at Los Alamos,
W74-04443 5B

Biochemical Ecology of Water Pollution,
W74-04523 5C

Ecology and Biocoenology of Lagunas or Lakes of Third Order of the Temperate Neotropical Region (Southeast Pampasic Region of Argentina), (In Spanish),
W74-04817 2H

ECONOMETRICS
Study of Pulp and Paper Industry's Effluent Treatment.
W74-04538 5D

ECONOMIC EFFICIENCY
Social, Economic, Environmental, and Technical Factors Influencing Water Reuse,
W74-04317 5D

ECONOMIC FEASIBILITY
Economic Aspects of Ground Water Resources and Replacement Flows in Semiarid Agricultural Areas,
W74-04563 4B

ECONOMICS
Benefit of Water Pollution Control on Property Values,
W74-04550 5G

Application of Dynamic Programming in Markov Chains to the Evaluation of Water Quality in Irrigation,
W74-04561 3C

ECOSYSTEMS
Ecodistribution of Plutonium in Liquid Waste Disposal Areas at Los Alamos,
W74-04443 5B

EDUCATION
Tenth Year Annual Report, Center for Research in Water Resources, University of Texas at Austin.
W74-04595 9A

EFFLUENT STREAMS
Zone of Flow Establishment for Round Buoyant Jets,
W74-04657 5B

EFFLUENTS
Mixing Processes,
W74-04327 5B

ELASTIC THEORY
Ice Engineering--Summary of Elastic Properties Research and Introduction to Viscoelastic and Nonlinear Analysis of Saline Ice,
W74-04793 2C

ELECTRIC POWER PRODUCTION
Economic Power from Geothermal Heat,
W74-04766 4B

ELECTRICAL CONDUCTANCE
Water Quality Records for the Hubbard Creek Watershed, Texas, October 1969-September 1972,
W74-04606 5B

ELECTRICAL STUDIES
Electromagnetic Probing of Permafrost,
W74-04400 2C

Electric Cloud and Weather Modification with Intense Relativistic Electron Beams,
W74-04604 3B

ELECTROLYSIS
Electrolysis as a Purification Method for Effluents of the Pulp and Paper Industry (Die Elektrolyse als Reinigungsverfahren fuer Abwaesser der Papier- und Zellstoffindustrie),
W74-04542 5D

ELECTROMAGNETIC SURVEYS
Electromagnetic Probing of Permafrost,
W74-04400 2C

ELECTRON BEAMS
Electric Cloud and Weather Modification with Intense Relativistic Electron Beams,
W74-04604 3B

ELECTRON MICROSCOPY
Scanning Electron Microscopy of Fixed, Frozen, and Dried Protozoa,
W74-04497 7B

Overgrowth of Ooze Iron-Manganese Microorganisms Studied by Electron Microscopy, (In Russian),
W74-04558 5A

EMBRYONIC GROWTH STAGE
Temperature Requirements for Embryos and Larvae of the Northern Pike, Esox lucius (Linnaeus),
W74-04670 5C

ENDANGERED SPECIES
Death of the Marshes in the Ardennes,
W74-04686 4A

ENERGY SLOPE
Shear Velocity in a Tidal Estuary,
W74-04629 2L

ENERGY TRANSFER
Harmonic Generation of Shallow Water Waves Over Topography,
W74-04323 2E

Physical and Dynamical Scales for Generation of Wind Waves,
W74-04330 2E

ENGINEERING EDUCATION
Environmental Chemistry: Air and Water Pollution,
W74-04513 5B

Physicochemical Processes for Water Quality Control,
W74-04546 5D

ENTEROBACTERIA
Salmonella Serotypes in Sewage of Various Origins,
W74-04850 5B

ENTEROVIRUSES
An Experiment in Sanitary-Virological Research on Sewage, (In Russian),
W74-04849 5B

ENTRAINMENT
Convective Heat Transfer to Water Containing Bubbles: Enhancement not Dependent on Thermocapillarity,
W74-04664 8B

ENVIRONMENTAL CONTROL
Social, Economic, Environmental, and Technical Factors Influencing Water Reuse,
W74-04317 5D

ENVIRONMENTAL EFFECTS
Environmental Considerations for the Utilization of Permafrost Terrain,
W74-04407 2C

Some Effects of Surface Disturbance on the Permafrost Active Layer at Inuvik, N.W.T., Canada,
W74-04413 4C

Managing Growth in a Fragile Environment: Problems of the Rocky Mountain States,
W74-04505 6D

Reviewing Environmental Impact Statements-Power Plant Cooling Systems, Engineering Aspects,
W74-04555 5G

ENVIRONMENTAL IMPACT STATEMENTS
Reviewing Environmental Impact Statements-Power Plant Cooling Systems, Engineering Aspects,
W74-04555 5G

ENVIRONMENTAL MANAGEMENT
State Environmental Management, Case Studies of Nine States,
W74-04503 5G

ENVIRONMENTAL PROTECTION
Some Problems Involved in Optimal Protection of the Environment in Spas,
W74-04847 5G

ENVIRONMENTAL QUALITY
Estimating the Benefits of Stream Valley and Open Space Preservation Projects,
W74-04500 6B

ENZYMES
Changes in Enzymes in the Plant as Related to Water Supply and Usage,
W74-04306 2I

Temperature Acclimation in the Medusa, Chrysaora quinquecirrha,
W74-04660 5C

EOLIAN DEPOSITION
Eolian Cross-Bedding in the Beach Dune Environment, Sapelo Island, Georgia,
W74-04737 2J

EPHEMEROPTERA (NYMPHS)
Benthic Fauna of a Tropical Man-Made Lake (Volta Lake, Ghana 1965-1968),
W74-04636 2H

EPIDEMIOLOGY
Salmonella Serotypes in Sewage of Various Origins,
W74-04850 5B

EPILIMNION
Movements of Phosphorus Between its Biologically Important Forms in Lake Water,
W74-04783 5B

EQUATIONS
On Solving the Unsaturated Flow Equation: 2. Critique of Parlange's Method.
W74-04492 2G

The Calculation of Critical Discharge Velocity of Streams in Uniform Flow and the Transported Sediment Size,
W74-04800 2J

The Problem of Critical Discharge in Sediment Motion,
W74-04801 2J

EQUILIBRIUM PROFILE
The Effect of Wave Refraction on the Formation of an Equilibrium Profile of Submarine Coastal Slope,
W74-04438 2J

EQUIPMENT
Modern Waste Water Treatment and Processing Techniques in the Paper and Board Industry (Moderne Abwasseraufbereitungs-und Verfahrenstechnik in der Papier- und Kartonindustrie),
W74-04517 5D

EROSION
Thermokarst Development, Banks Island, Western Canadian Arctic,
W74-04368 2C

Environmental Considerations for the Utilization of Permafrost Terrain,
W74-04407 2C

Some Effects of Surface Disturbance on the Permafrost Active Layer at Inuvik, N.W.T., Canada,
W74-04413 4C

Some Data on the Post-Glacial Evolution of Karkinit Bay and the Accumulation of Bottom Sediments Within it,
W74-04429 2J

Recent Development of the Temryuk Coast on the Azov Sea,
W74-04430 2J

Some Data on the Post-Glacial Transgression of the Bering Sea,
W74-04431 2J

Effect of the Forest on the Displacement of the Desna River Bed and the Significance of this Effect on Forest Planting in the Floodplain, (In Russian),
W74-04641 4A

Sea Waves and Beach Cusps,
W74-04734 2J

Beach Profiles of a Georgia Barrier Island,
W74-04736 2J

Drastic Beach Changes in a Low-Energy Environment Caused by Hurricane Betsy,
W74-04756 2J

Response and Recovery of a Piedmont Watershed from Tropical Storm Agnes, June 1972,
W74-04805 2J

EROSION RATES
Rates of Mass Wasting in the Ruby Range, Yukon Territory,
W74-04371 2J

ESTIMATED BENEFITS
Estimating the Benefits of Stream Valley and Open Space Preservation Projects,
W74-04500 6B

Land Value Increments as a Measure of the Net Benefits of Urban Water Supply Projects in Developing Countries: Theory and Measurement,
W74-04502 6B

ESTIMATING
Application of Regression Analysis to Estimation of the Efficiency of Water Use in Irrigation (Opyt primeneniya regressionnogo analiza k otsenke effektivnosti ispol'zovaniya vody pri oroshenii),
W74-04580 3F

ESTUARIES
A Three-Dimensional Model for Estuaries and Coastal Seas: Volume I, Principles of Computation,
W74-04301 2L

Estuaries,
W74-04321 2L

A Study of Diffusion in an Estuary,
W74-04333 5B

Shores and Shore Processes,
W74-04339 2L

Estuarine Currents and Tidal Streams,
W74-04344 2L

Sediment Movement at Indian Ports,
W74-04345 2L

Some Results of Regional Coastal Investigations in the USSR,
W74-04426 2J

Application of Fluorescent Coated Sand in Littoral Drift and Inlet Studies,
W74-04616 2L

Shear Velocity in a Tidal Estuary,
W74-04629 2L

Use of a Computational Model for Two-Dimensional Tidal Flow,
W74-04631 2L

Reproduction of Estuarine Structure and Current Observation Techniques in the Hecate Model,
W74-04724 2L

An Annotated Bibliography of Flushing and Dispersion in Tidal Waters,
W74-04731 2L

New Dimensions in Estuary Classification,
W74-04735 2L

The Analysis of Harbor and Estuary Systems,
W74-04745 2L

Phenomena Affecting Improvement of the Lower Columbia Estuary and Entrance,
W74-04763 2L

Coastal-Water Vegetation of the Lower Reaches of the Dnestr (In Russian),
W74-04813 2L

ESTURARIES
Constituent Transport in Estuaries,
W74-04627 2L

EUROPE
Reservoirs of Europe and Some Aspects of Their Construction and Multipurpose Use (Vodokhranilishcha zarubezhnoy Yevropy i nekotoryye voprosy ikh sozdaniya i kompleksnogo ispol'zovaniya),
W74-04582 8A

EUTROPHICATION
Nutrient Income Change Related to Plankton Algae,
W74-04318 5C

Ecological Characteristics of Go-No-Ike Lake,
W74-04638 5C

Calculation of the Concentration of the Biomass of Blue-Green Algae During Settling, (In Russian),
W74-04645 5C

Morphological Variation of Keratella cochlearis (Gosse) (Rotatoria) in Several Masurian Lakes of Different Trophic Level,
W74-04696 5C

Heterotrophic Utilization of Sucrose in an Artificially Enriched Lake,
W74-04781 5C

Eutrophication of Lake 227 by Addition of Phosphate and Nitrate: The Second, Third, and Fourth Years of Enrichment, 1970, 1971, and 1972,
W74-04789 5C

EVALUATION
Application of Dynamic Programming in Markov Chains to the Evaluation of Water Quality in Irrigation,
W74-04561 3C

A Simulation Model for Evaluating Irrigation Management Practices,
W74-04564 3F

Comments on Johnson's Paper, 'On the Wind-Driven Circulation of a Stratified Ocean',
W74-04675 2E

EVAPORATION
Solar Energy for the Concentration of Pulp Mill Effluents,
W74-04544 5D

EVAPORATORS
Effects of Condensates on the Toxicity of Kraft Pulp Mill Effluents,
W74-04521 5D

EVAPOTRANSPIRATION
Modeling of Turbulent Transport in the Surface Layer,
W74-04795 2D

EVERGREEN SCRUBS
Contribution to Knowledge about the Leaf Anatomy of Species of a 'Caatinga' of the Rio Negro (Amazon), (In Portuguese),
W74-04682 2I

EXCAVATION
Hydraulic Performance of Bridges--Excavations at Bridges,
W74-04482 8B

EXPANSIVE SOILS
Measurement of Moisture Diffusivity of Wet Swelling Systems,
W74-04493 2G

EXPLORATION
The Need of Geological Investigations for the Development of the Ground Water Resources of the Republic of Korea,
W74-04466 4B

Possible Application of Remote Sensing for Underground Water Exploration in Turkey,
W74-04568 7B

EXPLOSIVES
A Proposal for the Investigation of Possible Ground-Water Contamination in the Bangor Area, Kitsap County, Washington,
W74-04491 5B

FAIRBANKS (ALAS)
Geochemistry of Permafrost and Quaternary Stratigraphy,
W74-04364 2C

FALLOUT
Strontium-90 and Cesium-137 Levels in Soils of Various Types at Niigata Prefecture, Japan,
W74-04453 5B

Trans-Pacific Fallout and Protective Countermeasures,
W74-04454 5B

FARM WASTES
Some Neglected Sources of Water Pollution (Nedostatochno uchityvayemyye istochniki zagryazneniya prirodnykh vod),
W74-04579 5B

FATE OF POLLUTANTS
Laboratory Studies of the Accommodation of Some Crude and Residual Fuel Oils in Sea Water,
W74-04775 5B

FATHEAD MINNOWS
The Effects of Methoxychlor on Aquatic Biota,
W74-04553 5C

FATTY-ACIDS
A Possible Explanation for the Differences in the Fatty Acid Composition of Fresh-Water and Marine Fishes,
W74-04688 5C

FAULTS (GEOLOGIC)
Waves Generated by Horizontal Motion of a Wall,
W74-04760 8B

FEDERAL GOVERNMENT
What's Wrong with Government Water Control Programs and how They can be Improved,
W74-04632 5D

FEEDING HABITS
The Feeding of Pelecus Cultratus L. in Kairakkum Reservoir, (In Russian),
W74-04695 2H

FERMENTATION
Finland Starts Production of Protein from Black Liquor.
W74-04526 5D

FERTILITY
Sex Cycle, Spawning and Fertility of West Siberian Crucians in the Steppe Lakes, (In Russian),
W74-04689 2H

FERTILIZATION
A Study on the Depth of Basic Tillage and Soil Fertilization for Maize Grown Under Irrigation, (In Bulgarian),
W74-04828 3F

FERTILIZERS
Phosphorus Relationships in Runoff from Fertilized Soils,
W74-04471 5B

Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario,
W74-04478 5B

Paper Mill Sludge Disposal on Soils: Effects on the Yield and Mineral Nutrition of Oats (Avena satival.),
W74-04519 5E

Some Neglected Sources of Water Pollution (Nedostatochno uchityvayemyye istochniki zagryazneniya prirodnykh vod),
W74-04579 5B

Soluble Phosphate Output of an Agricultural Watershed in Pennsylvania,
W74-04804 5B

Utilization of Nutrients from Soil and Fertilizers by Pasture Grass as Dependent on Soil Moisture (In Russian),
W74-04820 4A

Effect of Fertilizers and Irrigation Conditions on Yield, Chemical Composition, Baking Qualities of Winter Wheat Grain of Bezostaya 1 Cultivar, (In Russian),
W74-04830 3F

FETCH
Physical and Dynamical Scales for Generation of Wind Waves,
W74-04330 2E

Approximate Estimations of Correlation Coefficient Between Wave Height and Period of Shallow Water Wind Waves,
W74-04761 2L

FILTERS
Gravity Dewatering: Application to Paper Mill Wastes,
W74-04533 5D

FILTRATION
Gravity Dewatering: Application to Paper Mill Wastes,
W74-04533 5D

Papermill Treatment Plant for Small Industry.
W74-04534 5D

Water Purification,
W74-04706 5F

Sedimentation Tanks,
W74-04708 5D

FINITE ELEMENT ANALYSIS
The Application of Numerical Simulation Models in the Assessment of the Effect of Discharges into Coastal Waters,
W74-04674 5B

FINLAND
Finland Starts Production of Protein from Black Liquor.
W74-04526 5D

Effects of Toxicants on Brackish-Water Phytoplankton Assimilation,
W74-04644 5C

FISH
The Preferred Temperature of Fish and Their Midsummer Distribution in Temperate Lakes and Streams,
W74-04666 5C

FISH BARRIERS
Conduit Structure for Migrating Fish,
W74-04715 8I

FISH BEHAVIOR
Thermal Responses in Cirrhina mrigala Fry,
W74-04661 5C

Effect of Light on Vulnerability of Heat-Stressed Sockeye Salmon to Predation by Coho Salmon,
W74-04671 5C

Apparatus for Recording Avoidance Movements of Fish,
W74-04776 5A

FISH DIETS
Morphology and Life Style of the Turkestan Gudgeon Gobio gobio lepidolaemus Kessler in Waters of the Sukhan-Darya Basin, (In Russian),
W74-04650 8I

FISH HATCHERIES
Pink and Chum Salmon Culture,
W74-04797 8I

FISH MIGRATION
Conduit Structure for Migrating Fish,
W74-04715 8I

FISH PASSAGES
Conduit Structure for Migrating Fish,
W74-04715 8I

FISH PHYSIOLOGY
Effects of Temperature on Developing Meristic Structures of Smallmouth Bass, Micropterus dolomieui Lacepede,
W74-04663 5C

FISH POPULATIONS
Vertical Distribution of Fishes Relative to Physical, Chemical and Biological Features in Two Central Arizona Reservoirs,
W74-04474 5C

FISH REPRODUCTION
The Effects of Methoxychlor on Aquatic Biota,
W74-04553 5C

Morphology and Life Style of the Turkestan Gudgeon Gobio gobio lepidolaemus Kessler in Waters of the Sukhan-Darya Basin, (In Russian),
W74-04650 8I

Sex Cycle, Spawning and Fertility of West Siberian Crucians in the Steppe Lakes, (In Russian),
W74-04689 2H

FISH TAXONOMY
Hybridization Between the Darters Percina crassa roanoka and Percina oxyrhyncha (Percidae, Etheostomatini), with Comments on the Distribution of Percina crassa roanoka in New River,
W74-04472 2E

FISHERIES
Parasite Fauna of Ctenopharyngodon idella from Pond- and Spawning-Nursery Fisheries in the Volga Delta, (In Russian),
W74-04702 8I

FISHERY SURVEY
Fishery Survey Carried out at Lake Borullus, A. R. E., in the Spring of 1971, (In Czech),
W74-04643 2H

FJORDS
Some Results of Regional Coastal Investigations in the USSR,
W74-04426 2J

Studies of a Southern Fiord.
W74-04727 2J

FLOCCULATION
Mercury Removal from Waste Water with Starch Xanthate-Cationic Polymer Complex,
W74-04541 5D

Process for Purifying Water that Contains Organic Matter,
W74-04716 5D

Method of Treating Sewage Using High Polymer Ratio Flocculation Agent Biologically Produced in Situ,
W74-04717 5D

FLOOD CONTROL
Approaches to Stormwater Management,
W74-04458 5A

Flood Proofing Decisions Under Uncertainty: An Application to the Connecticut River Basin,
W74-04463 6A

FLOOD DAMAGE
Flood Proofing Decisions Under Uncertainty: An Application to the Connecticut River Basin,
W74-04463 6A

FLOOD FORECASTING
Power Law Dependence on Time of River Flood Decay and Its Relationship to Long-Term Discharge Frequency Distribution,
W74-04806 4A

FLOOD FREQUENCY
Power Law Dependence on Time of River Flood Decay and Its Relationship to Long-Term Discharge Frequency Distribution,
W74-04806 4A

FLOOD PLAINS
Hydraulic Performance of Bridges--Excavations at Bridges,
W74-04482 8B

FLOODING
Effects of Flooding and Draining and Their Alternation on the Growth and Uptake of Nutrients by Rice (Oryza Sativa L., Indica Var. IR-8),
W74-04826 3F

FLOODPLAINS
Effect of the Forest on the Displacement of the Desna River Bed and the Significance of this Effect on Forest Planting in the Floodplain, (In Russian),
W74-04641 4A

FLOODS
Paleohydrology and Sedimentology of Lake Missoula Flooding in Eastern Washington,
W74-04599 2E

Response and Recovery of a Piedmont Watershed from Tropical Storm Agnes, June 1972,
W74-04805 2J

FLORIDA
Hydrogeologic Characteristics of the Surficial Aquifer in Northwest Hillsborough County, Florida,
W74-04468 2F

Effects of Backpumping from South New River Canal at Pump Station S-9 on Quality of Water in Water-Conservation Area 3, Broward County, Florida,
W74-04600 5B

Hydrologic and Geologic Considerations for Solid-Waste Disposal in West-Central Florida,
W74-04605 5E

Application of Fluorescent Coated Sand in Littoral Drift and Inlet Studies,
W74-04616 2L

Quantitative Tracing of Littoral Drift,
W74-04617 2J

A Field Investigation of Sand Transport in the Surf Zone,
W74-04619 2J

Drastic Beach Changes in a Low-Energy Environment Caused by Hurricane Betsy,
W74-04756 2J

FLOTATION
Mechanical Clarification of Industrial Waste Waters (Mechanische Klaerung von Industrieabwaessern).
W74-04515 5D

FLOTSAM
Skimmer Trap,
W74-04713 5G

FLUCTUATIONS
Spectra of the Temperature and Humidity Fluctuations and of the Fluxes of Moisture and Sensible Heat in the Marine Boundary Layer,
W74-04672 2E

Measurements of the Turbulent Fluxes of Momentum, Moisture and Sensible Heat Over the Ocean,
W74-04673 2E

FLUID MECHANICS
Simulation of Horizontal Turbulent Diffusion of Particles Under Waves,
W74-04624 2J

Analytical Methods of Solution of Conjugated Problems in Convective Heat Transfer,
W74-04667 8B

Application of the Finite Element Method to Convection Heat Transfer Between Parallel Planes,
W74-04765 8B

FOOD CHAINS
Vertical Distribution of Fishes Relative to Physical, Chemical and Biological Features in Two Central Arizona Reservoirs,
W74-04474 5C

FOOD PROCESSING INDUSTRY
Clarification Method of Polluted Water from Paper Mills With Combination of Beer Effluent (In Japanese),
W74-04528 5D

FORAGE PLANTS
Some New Data Concerning Zizania latifolia (Grisob.) STAPF AND ITS Resources in the Flood Plains of Lower Amur,
W74-04703 2I

FORECASTING
A Review of Oceanographic Variables and Their Analyses and Predictions Over the Continental Shelf,
W74-04329 2L

Wave Forecasting Relationships for the Gulf of Mexico,
W74-04729 2E

Numerical Computations of Storm Surges with Bottom Stress,
W74-04759 2L

FOREIGN RESEARCH
The Need of Geological Investigations for the Development of the Ground Water Resources of the Republic of Korea,
W74-04466 4B

FOREST PLANTING
Effect of the Forest on the Displacement of the Desna River Bed and the Significance of this Effect on Forest Planting in the Floodplain, (In Russian),
W74-04641 4A

FORESTS
Annual Consumption of Cesium-137 and Cobalt-60 Labeled Pine Seeds by Small Mammals in an Oak-Hickory Forest,
W74-04450 5B

FORT LOUDOUN RESERVOIR (TENN
Remote Sensing in Sampling Site Location in Lakes and Streams,
W74-04313 5A

FRANCE (ARDENNES PLATEAU)
Death of the Marshes in the Ardennes,
W74-04686 4A

FRANCE (MORVAN REGION)
Comparative Study, in 1966 and 1967, of Three Reservoirs in the Project of a Natural Park in the Morvan Region (In French),
W74-04815 5C

FREEZE DRYING
Scanning Electron Microscopy of Fixed, Frozen, and Dried Protozoa,
W74-04497 7B

FREEZING
Thermal Disturbance Due to Channel Shifting Mackenzie Delta, N.W.T., Canada,
W74-04351 2C

Ecological Effects of River Flooding and Forest Fires on Permafrost in the Taiga of Alaska,
W74-04352 2C

Physics, Chemistry, and Mechanics of Frozen Ground: A Review,
W74-04373 2C

The Unfrozen Water and the Apparent Specific Heat Capacity of Frozen Soils,
W74-04374 2C

Effect of Porosity on Amount of Soil Water Transferred in a Freezing Silt,
W74-04376 2C

Soil Freezing in Relation to Pore Water Pressure and Temperature,
W74-04381 2C

Experimental Pressure Studies on Frost Heave Mechanisms and the Growth-Fusion Behavior of Ice,
W74-04385 2C

Effects of Salt Concentration Changes During Freezing on the Unfrozen Water Content of Porous Materials,
W74-04802 2C

FREQUENCY ANALYSIS
An Approximation of the Wave Run-Up Frequency Distribution,
W74-04740 2L

FROST
A Simulation Sensitivity Analysis of the Needle Ice Growth Environment,
W74-04370 2C

FROST ACTION
A Simulation Sensitivity Analysis of the Needle Ice Growth Environment,
W74-04370 2C

Physics, Chemistry, and Mechanics of Frozen Ground: A Review,
W74-04373 2C

FROST HEAVING
Experimental Pressure Studies on Frost Heave Mechanisms and the Growth-Fusion Behavior of Ice,
W74-04385 2C

Sample Disturbance and Thaw Consolidation of a Deep Sand Permafrost,
W74-04387 2C

Pore Water and Heaving Pressures Developed in Partially Frozen Soils,
W74-04389 2C

Some Passive Methods of Controlling Geocryological Conditions in Roadway Construction,
W74-04406 2C

Corps of Engineers Technology Related to Design of Pavements in Areas of Permafrost,
W74-04414 4C

FROTH FLOTATION
Screening Aerator Concentrator,
W74-04712 5D

FROZEN GROUND
Studies at the Timmins 4 Permafrost Experimental Site,
W74-04363 2C

Origin, Composition, and Structure of Perennially Frozen Ground and Ground Ice: A Review,
W74-04366 2C

Thermokarst Development, Banks Island, Western Canadian Arctic,
W74-04368 2C

Physics, Chemistry, and Mechanics of Frozen Ground: A Review,
W74-04373 2C

Effect of Porosity on Amount of Soil Water Transferred in a Freezing Silt,
W74-04376 2C

Mechanical Properties of Rocks at Low Temperatures,
W74-04380 2C

In Situ Physicomechanical Properties of Permafrost Using Geophysical Techniques,
W74-04399 2C

Potential Use of Airborne Dual-Channel Infrared Scanning to Detect Massive Ice in Permafrost,
W74-04403 7B

Stability of an Underground Room in Frozen Gravel,
W74-04418 2C

FROZEN SOILS
The Unfrozen Water and the Apparent Specific Heat Capacity of Frozen Soils,
W74-04374 2C

Mechanical Properties of Frozen Ground Under High Pressure,
W74-04375 2C

Shock-Wave Studies of Ice and Two Frozen Soils,
W74-04378 2C

Thaw Consolidation of Alaskan Silts and Granular Soils,
W74-04379 2C

Soil Freezing in Relation to Pore Water Pressure and Temperature,
W74-04381 2C

Sound and Shock Transmission in Frozen Soils,
W74-04383 2C

Practical Extensions to a Theory of Consolidation for Thawing Soils,
W74-04384 2C

Experimental Pressure Studies on Frost Heave Mechanisms and the Growth-Fusion Behavior of Ice,
W74-04385 2C

Triaxial and Creep Tests on Frozen Ottawa Sand,
W74-04386 2C

Viscoelastic Properties of Frozen Soil Under Vibratory Loads,
W74-04388 8D

Pore Water and Heaving Pressures Developed in Partially Frozen Soils,
W74-04389 2C

Effects of Salt Concentration Changes During Freezing on the Unfrozen Water Content of Porous Materials,
W74-04802 2C

FUEL REPROCESSING
Disposal of Radioactive Wastes,
W74-04445 5D

Environmental Surveillance for Fuel Fabrication Plants,
W74-04451 5B

Industry Awaits Solutions to Problems of High-Level Radioactive-Waste Management,
W74-04457 5D

FUELS
Breeder Reactors: Power for the Future,
W74-04656 8C

FUNDING (ALLOCATION)
Allocation of Funding for Wastewater Treatment Facilities,
W74-04562 5D

FUNGUS DISEASES (CROPS)
Rainfed Rice in Southern Senegal: Evaluation of Three Years' Experimentation (1966-1969), (In French),
W74-04829 3F

GALVESTON BAY
Galveston Bay Hurricane Surge Study: Report 2. Effects of Proposed Barriers on Tides, Currents, Salinities, and Dye Dispersion for Normal Tide Conditions--Appendix B: Calibration tests,
W74-04573 8B

GARBAGE DUMPS
Hydrologic and Geologic Considerations for Solid-Waste Disposal in West-Central Florida,
W74-04605 5E

GAS CHROMATOGRAPHY
Analytical Techniques for the Determination of Petroleum Contamination in Marine Organisms,
W74-04594 5A

Thin-Layer and Gas-Chromatographic Determination of Phenols Present in Water, (In German),
W74-04684 5A

Diurnal Variation of Dissolved Inorganic Carbon and its Use in Estimating Primary Production and CO2 Invasion in Lake 227,
W74-04784 5A

Production of Epilithiphyton in Two Lakes of the Experimental Lakes Area, Northwestern Ontario,
W74-04787 5C

A Syringe Gas-Stripping Procedure for Gas-Chromatographic Determination of Dissolved Inorganic and Organic Carbon in Fresh Water and Carbonates in Sediments,
W74-04788 5A

GASES
Land Disposal of Waste Gases: 1. Flow Analysis of Gas Injection Systems,
W74-04479 5E

Land Disposal of Waste Gases: II. Gas Flow from Buried Pipes,
W74-04480 5E

GENETIC TRANSMISSION
New Contributions to Biological Study of Genetic Transmission of Resistance to Dryness in Double Hybrids of Zea Mays,
W74-04833 3F

GEOCHEMISTRY
Geochemistry of Permafrost and Quaternary Stratigraphy,
W74-04364 2C

GEOLOGIC HISTORY
History of the Formation of the Coasts of Kara-Bogaz-Gol,
W74-04427 2J

Some Data on the Post-Glacial Transgression of the Bering Sea,
W74-04431 2J

GEOLOGIC MAPPING
The Need of Geological Investigations for the Development of the Ground Water Resources of the Republic of Korea,
W74-04466 4B

GEOMORPHOLOGY
Growth of Patterned Ground in Victoria Land, Antarctica,
W74-04367 2C

Topology of River Systems and Hydrographic Indicator Studies (Topologiya rechnykh sistem i gidrograficheskiye indikatsionnyye issledovaniya),
W74-04578 2A

Slope Development on a Mississippi River Bluff in Historic Time,
W74-04585 2J

GEOPHYSICS
Geophysical Identification of Frozen and Unfrozen Ground, Antarctica,
W74-04360 2C

Electromagnetic Probing of Permafrost,
W74-04400 2C

GEORGIA
Multipurpose Reservoirs and Urban Development,
W74-04319 6B

Beach Profiles of a Georgia Barrier Island,
W74-04736 2J

Eolian Cross-Bedding in the Beach Dune Environment, Sapelo Island, Georgia,
W74-04737 2J

High-Angle Beach Stratification, Sapelo Island, Georgia,
W74-04738 2J

GEOTHERMAL POWER
Ground Water and the Geothermal Resource.
W74-04586 4B

GEOTHERMAL STUDIES
Deep Temperature Observations in the Canadian North,
W74-04349 2C

Ground Water and the Geothermal Resource.
W74-04586 4B

Economic Power from Geothermal Heat,
W74-04766 4B

GERMANY
Modern Waste Water Treatment and Processing Techniques in the Paper and Board Industry (Moderne Abwasseraufbereitungs-und Verfahrenstechnik in der Papier- und Kartonindustrie),
W74-04517 5D

Ecological Investigations of Ponds with Special Regard to the Consequences of Water Pollution by Oil, (In German),
W74-04635 5C

GERMANY (BERLIN AREA)
Problem of Isolating Salmonella from Surface Waters Exemplified by Long-Term Studies in the Berlin Area, Capital of the German Democratic Republic, (In German),
W74-04835 5A

GERMANY (FREIBURG-IM-BREISGRAW)
Chironomidae (Diptera) from the Area of Freiburg in Breisgau (with Special Consideration of the Genus Chironomus), (In German),
W74-04678 2H

GERMANY (LAKE OF CONSTANCE)
The Relation Between Phytoplankton and Phosphate in the Lake of Constance, (In German),
W74-04637 5C

GERMANY (RHINE RIVER)
Principles of Evaluating Effects of Thermal Discharges on Surface Waters (Grundlagen fur die Beurteilung der Warmebelastungen von Gewassern).
W74-04764 5C

GHANA (VOLTA LAKE)
Benthic Fauna of a Tropical Man-Made Lake (Volta Lake, Ghana 1965-1968),
W74-04636 2H

GILLS
Mercury Uptake and Ion Distribution in Gills of Rainbow Trout (Salmo gairdneri): Tissue Scans with an Electron Microprobe,
W74-04778 5A

GLACIAL DRIFT
Quickclays as Products of Glacial Action: A New Approach to Their Nature, Geology, Distribution and Geotechnical Properties,
W74-04590 2G

GLACIERS
Accumulation on the Devon Island Ice Cap, Northwest Territories, Canada,
W74-04325 2C

Radio Depth-Sounding on Meighen and Barnes Ice Caps, Arctic Canada,
W74-04571 2C

GRAIN
Role of Soil Conditions in the Development of Moths, (In Russian),
W74-04640 3F

GRASSES
Production Ability of Legumes, Grasses and Their Mixtures in Hill-Land Regions,
W74-04694 4A

GRASSLANDS
Effect of Long-Term Application of Variously High Rates of Nutrients on Natural Grassland Swards,
W74-04693 4A

GRAVELS
Stability of an Underground Room in Frozen Gravel,
W74-04418 2C

GRAVITY WAVES
On Non-Saturated Breakers and the Wave Run-Up,
W74-04742 2L

Waves and Tides Near the Shore,
W74-04758 2L

Propagation of a Finite-Amplitude Surface Wave With Allowance for Random Irregularities of the Bottom,
W74-04841 2J

GREAT LAKES
Littoral Transport in the Great Lakes,
W74-04334 2J

Modification of Nearshore Currents by Coastal Structures,
W74-04341 8B

GREEN FODDER
Effect of Light Intensity on the Quality and Feeding Effectiveness of Green Fodder, (In Russian),
W74-04821 3F

GREENLAND
Thermal Regime in an Arctic Earthfill Dam,
W74-04410 8D

GROUNDWATER
Problems in the Origin of Massive Icy Beds, Western Arctic, Canada,
W74-04369 2C

Groundwater Investigations in Permafrost Regions of North America: A Review,
W74-04391 2F

A Groundwater Supply for an Oil Camp Near Prudhoe Bay, Arctic Alaska,
W74-04396 2F

Southwestern Groundwater Law: A Textual and Bibliographic Interpretation,
W74-04460 4B

The Need of Geological Investigations for the Development of the Ground Water Resources of the Republic of Korea,
W74-04466 4B

Prediction of the 1972 Managua, Nicaragua, Earthquake from Groundwater Changes, Inferred Probability of Earthquakes in the City of Managua, Nicaragua, during the Summer of 1973,
W74-04467 2F

Evaluation of the Ground-Water Supply at Eight Sites in Glacier National Park, Northwestern Montana,
W74-04469 2F

Possible Application of Remote Sensing for Underground Water Exploration in Turkey,
W74-04568 7B

Groundwater Investigation and Management in Iran,
W74-04569 7B

Ground Water and the Geothermal Resource.
W74-04586 4B

Availability of Ground Water in the Winnsboro Area, Louisiana,
W74-04596 4B

GROUNDWATER MANAGEMENT
Economic Aspects of Ground Water Resources and Replacement Flows in Semiarid Agricultural Areas,
W74-04563 4B

GROUNDWATER MOVEMENT
Effect of Porosity on Amount of Soil Water Transferred in a Freezing Silt,
W74-04376 2C

Hydrogeologic Characteristics of the Surficial Aquifer in Northwest Hillsborough County, Florida,
W74-04468 2F

A Proposal for the Investigation of Possible Ground-Water Contamination in the Bangor Area, Kitsap County, Washington,
W74-04491 5B

GROUNDWATER RESOURCES
Reconnaissance of the Ground-Water Resources of Cimarron County, Oklahoma,
W74-04495 4B

GROWTH RATES
Managing Growth in a Fragile Environment: Problems of the Rocky Mountain States,
W74-04505 6D

Effects of Temperature on Developing Meristic Structures of Smallmouth Bass, Micropterus dolomieui Lacepede,
W74-04663 5C

Temperature Requirements for Embryos and Larvae of the Northern Pike, Esox lucius (Linnaeus),
W74-04670 5C

GROWTH STAGES
Feeding of Juvenile Carp Cyprinus carpio L. in the Arakum Bodies of Water (Delta of the Terek River) at Early Developmental Stages, (In Russian),
W74-04649 2L

Influence of Soil Moisture Conditions on Growth and Development of the Potato Solanum tuberosum L.,
W74-04687 3F

GUDGEON
Morphology and Life Style of the Turkestan Gudgeon Gobio gobio lepidolaemus Kessler in Waters of the Sukhan-Darya Basin, (In Russian),
W74-04650 8I

GULF OF MEXICO
Wave Forecasting Relationships for the Gulf of Mexico,
W74-04729 2E

GULFS
History of the Formation of the Coasts of Kara-Bogaz-Gol,
W74-04427 2J

HALIBUT
Analysis of Trace Elements, Phosphorus and Sulphur, in the Lipid and the Non-Lipid Phase of Halibut (Hippoglossus hippoglossus) and Tunny (Thunnus thynnus),
W74-04770 5A

HARBORS
Modification of Nearshore Currents by Coastal Structures,
W74-04341 8B

Currents at Harbor Beach, Michigan,

Environmental Monitoring and Disposal of Radioactive Wastes from U.S. Naval Nuclear-Powered Ships and Their Support Facilities, 1972,
W74-04441 5B

Galveston Bay Hurricane Surge Study: Report 2. Effects of Proposed Barriers on Tides, Currents, Salinities, and Dye Dispersion for Normal Tide Conditions--Appendix B: Calibration tests,
W74-04573 8B

Wave Action and Breakwater Design, Hamlin Beach Harbor, New York,
W74-04588 8B

Waves Off Benghazi Harbour - Libya,
W74-04608 2L

Hydraulic Model Experiment on the Duffusion Due to the Coastal Current,
W74-04628 5B

Feasibility Study for a Surge-Action Model of Monterey Harbor, California,
W74-04721 2L

Effect of Entrance on Seiche Motion in Ocean Ports,
W74-04743 2L

Investigation of Seiche Activity in West Coast Harbors,
W74-04744 2L

The Analysis of Harbor and Estuary Systems,
W74-04745 2L

HAWAII
Baseline Quality Data for Kalihi Stream,
W74-04309 5B

HEAT
Measurements of the Turbulent Fluxes of Momentum, Moisture and Sensible Heat Over the Ocean,
W74-04673 2E

HEAT BUDGET
Detailed Time Variations in Mean Temperature and Heat Content of Some Madison Lakes,
W74-04659 2H

Principles of Evaluating Effects of Thermal Discharges on Surface Waters (Grundlagen fur die Beurteilung der Warmebelastungen von Gewassern).
W74-04764 5C

HEAT EXCHANGERS
An Analytical Study of a Coiled-Pipe Heat Sink,
W74-04589 8B

Economic Power from Geothermal Heat,
W74-04766 4B

HEAT FLOW
Thermal Conditions in Permafrost--A Review of North American Literature,
W74-04347 2C

A General Solution for the Two-Dimensional, Transient Heat Conduction Problem in Permafrost, Using Implicit, Finite Difference Methods,
W74-04350 2C

Thermal Disturbance Due to Channel Shifting, Mackenzie Delta, N.W.T., Canada,
W74-04351 2C

HEAT FLUX
Application of the Finite Element Method to Convection Heat Transfer Between Parallel Planes,
W74-04765 8B

HEAT SINKS
An Analytical Study of a Coiled-Pipe Heat Sink,
W74-04589 8B

HEAT STRESS
Effect of Light on Vulnerability of Heat-Stressed Sockeye Salmon to Predation by Coho Salmon,
W74-04671 5C

HEAT TRANSFER
A General Solution for the Two-Dimensional, Transient Heat Conduction Problem in Permafrost, Using Implicit, Finite Difference Methods,
W74-04350 2C

An Analytical Study of a Coiled-Pipe Heat Sink,
W74-04589 8B

Convective Heat Transfer to Water Containing Bubbles: Enhancement not Dependent on Thermocapillarity,
W74-04664 8B

Analytical Methods of Solution of Conjugated Problems in Convective Heat Transfer,
W74-04667 8B

Application of the Finite Element Method to Convection Heat Transfer Between Parallel Planes,
W74-04765 8B

Economic Power from Geothermal Heat,
W74-04766 4B

HEATED PIPELINES
Permafrost Protection for Pipelines,
W74-04415 2C

HEATED WATER
Buoyancy Spread of Waste Water in Coastal Regions,
W74-04630 5B

HECATE MODEL
Reproduction of Estuarine Structure and Current Observation Techniques in the Hecate Model,
W74-04724 2L

HETEROTROPHIC BACTERIA
Heterotrophic Utilization of Sucrose in an Artificially Enriched Lake,
W74-04781 5C

HINDCASTING
Wave Forecasting Relationships for the Gulf of Mexico,
W74-04729 2E

HINDCASTS
The Effect of Waves on the Profile of a Natural Beach,
W74-04620 2J

HOUSING
Housing and Planning References.
W74-04511 3D

HUMIDITY
Water in Wood,
W74-04545 2I

Spectra of the Temperature and Humidity Fluctuations and of the Fluxes of Moisture and Sensible Heat in the Marine Boundary Layer,
W74-04672 2E

HUMUS
Influences of Soil Density, Clay Silt and Humus Content on Measurements of Soil Water by Neutron Gauges, (In German),
W74-04556 2G

HUNGARY
Water Problems of the Tisza River in Hungary and Cooperation Among Tisza Basin Countries in the Field of Water Management (Vodnyye problemy reki Tisy v Vengrii i sotrudnichestvo stran basseyna Tisy v oblasti vodnogo khozvayst va),
W74-04574 4A

HUNGARY (LAKE BALATON)
Distribution of Organic Matter and Bacteria in the Upper Layer of Bottom Deposit of Lake Balaton,
W74-04839 5B

HURRICANES
Hurricane Storm Surge Considered as a Resonance Phenomenon,
W74-04332 2L

Hurricane Tide Prediction for New York Bay,
W74-04343 2L

Galveston Bay Hurricane Surge Study: Report 2. Effects of Proposed Barriers on Tides, Cur-

rents, Salinities, and Dye Dispersion for Normal Tide Conditions--Appendix B: Calibration tests,
W74-04573 8B

Drastic Beach Changes in a Low-Energy Environment Caused by Hurricane Betsy,
W74-04756 2J

Response and Recovery of a Piedmont Watershed from Tropical Storm Agnes, June 1972,
W74-04805 2J

HYBRIDS (CORN)
New Contributions to Biological Study of Genetic Transmission of Resistance to Dryness in Double Hybrids of Zea Mays,
W74-04833 3F

HYDRAULIC MODELS
The Relationship Between Wave Action and Beach Profile Characteristics,
W74-04331 2J

A Laboratory Investigation of Free Surface Flows Over Wavy Beds,
W74-04477 8B

Galveston Bay Hurricane Surge Study: Report 2. Effects of Proposed Barriers on Tides, Currents, Salinities, and Dye Dispersion for Normal Tide Conditions--Appendix B: Calibration tests,
W74-04573 8B

Wave Action and Breakwater Design, Hamlin Beach Harbor, New York,
W74-04588 8B

Study of Beach Widening By the Perched Beach Concept, Santa Monica Bay, California,
W74-04603 8B

Hydraulic Model Experiment on the Duffusion Due to the Coastal Current,
W74-04628 5B

Use of a Computational Model for Two-Dimensional Tidal Flow,
W74-04631 2L

HYDROGEN ION CONCENTRATION
Water Quality Requirements of Aquatic Insects,
W74-04551 5C

HYDROGEOLOGY
The Need of Geological Investigations for the Development of the Ground Water Resources of the Republic of Korea,
W74-04466 4B

Hydrogeologic Characteristics of the Surficial Aquifer in Northwest Hillsborough County, Florida,
W74-04468 2F

Reconnaissance of the Ground-Water Resources of Cimarron County, Oklahoma,
W74-04495 4B

Possible Application of Remote Sensing for Underground Water Exploration in Turkey,
W74-04568 7B

Groundwater Investigation and Management in Iran,
W74-04569 7B

Hydrogeologic Considerations in Solid Waste Storage in Iowa: Part 1. Sanitary Landfill Site Selection: Part 2. A Method of Hazardous and Toxic Waste Disposal,
W74-04592 5E

Hydrologic and Geologic Considerations for Solid-Waste Disposal in West-Central Florida,
W74-04605 5E

Mississippian Aquifer of Iowa,
W74-04843 7C

HYDROGRAPHS
A Study on the Accuracy of Runoff Analysis for Pumping Drainage in Paddy Field Area (In Japanese),
W74-04811 4A

HYDROGRAPHY
Topology of River Systems and Hydrographic Indicator Studies (Topologiya rechnykh sistem i gidrograficheskiye indikatsionnyye issledovaniya),
W74-04578 2A

HYDROLOGIC DATA
Mathematical Modeling of Stream Storage Potential,
W74-04305 2E

Linear Systems Technique Applied to Hydrologic Data Analysis and Instrument Evaluation: A Case Study on Data from the Alice Springs Area,
W74-04470 2A

Quantity and Chemical Quality of Low Flow in the East Fork San Jacinto and West Fork San Jacinto Rivers near Houston, Texas, June 24, 26, 1969,
W74-04481 5B

Evaluation and Simulation of Chemical-Quality Data for Five Montana Sampling Stations,
W74-04484 2K

Ground-Water Data for Harris County, Texas: Volume I. Drillers' Logs of Wells, 1905-71.
W74-04602 4B

Water Quality Records for the Hubbard Creek Watershed, Texas, October 1969-September 1972,
W74-04606 5B

Characteristics of Streamflow at Gaging Stations in the Loup River Basin, Nebraska,
W74-04794 2E

Surface- and Ground-Water Conditions During 1959-61 in a Part of Flett Creek Basin, Tacoma, Washington,
W74-04796 2E

Hydrologic Data for Small Rural Catchments in Australia, 1973,
W74-04842 2E

Mississippian Aquifer of Iowa,
W74-04843 7C

HYDROLOGICAL CYCLE
Urbanization: A Hydrological Headache,
W74-04642 4C

HYDROLOGY
Cento Seminar on the Application of Remote Sensors in the Determination of natural Resources.
W74-04567 7B

Operational and Experimental Remote Sensing in Hydrology,
W74-04570 7B

HYGIENIC MEASURES
Hygienic Efficiency of Measures for Protecting Surface Waters in Uzbek SSR, (In Russian),
W74-04838 5F

HYGROSCOPIC WATER
Water in Wood,
W74-04545 2I

HYPERBOLIC WAVES
Hyperbolic Waves and Their Shoaling,
W74-04611 2E

HYPOCHLORINATION
Hypochlorination of Polluted Storm-Water Pumpage at New Orleans,
W74-04676 5D

ICE
Thermokarst Development, Banks Island, Western Canadian Arctic,
W74-04368 2C

Problems in the Origin of Massive Icy Beds, Western Arctic, Canada,
W74-04369 2C

Groundwater Pore Pressures Adjacent to Subarctic Streams,
W74-04393 2C

Potential Use of Airborne Dual-Channel Infrared Scanning to Detect Massive Ice in Permafrost,
W74-04403 7B

Control of Culvert Icing,
W74-04411 4C

ICE BREAKUP
The Nature of the Seawater-Freshwater Interface During Breakup in the Colville River Delta, Alaska,
W74-04397 2C

ICE CAPS
Accumulation on the Devon Island Ice Cap, Northwest Territories, Canada,
W74-04325 2C

ICE CONTROL
Control of Culvert Icing,
W74-04411 4C

ICE LOADS
Ice Engineering--Summary of Elastic Properties Research and Introduction to Viscoelastic and Nonlinear Analysis of Saline Ice,
W74-04793 2C

ICE WEDGES
Growth of Patterned Ground in Victoria Land, Antarctica,
W74-04367 2C

ICELAND
Concerning Large-Scale Cultivation of Thermophilic Cosmopolitan Mastigocladus Laminousus Cohn (Cyanophyta) in Icelandic Hot Springs,
W74-04486 2I

IDAHO
A Radiological Environmental Survey at EBR-II,
W74-04455 5B

Suspended and Bedload Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W74-04846 2J

AMINES
Determination of Microgram Quantities of Polyethylene Polyamines in Water, (In Russian),
W74-04701 5A

IMPAIRED WATER USE
Social, Economic, Environmental, and Technical Factors Influencing Water Reuse,
W74-04317 5D

IMPOUNDMENTS
Multipurpose Reservoirs and Urban Development,
W74-04319 6B

INCINERATION
Catalytic Oxidation and Thermal Treatment of Waste Waters (Kataliticheskoe okislenie i termicheskoe obezvrezhivanie stochnykh vod),
W74-04537 5D

Waste Automotive Lubricating Oil as a Municipal Incinerator Fuel,
W74-04549 5D

INDIA
Sediment Movement at Indian Ports,
W74-04345 2L

Characteristics of Pulp and Paper Mill Wastes and ISI Standards,
W74-04530 5B

Low Cost Methods for Treating Pulp and Paper Mill Effluents,
W74-04531 5D

INDIA (RAJASTHAN CANAL PROJECT)
The Rajasthan Canal Area: A Settlement Structure,
W74-04499 6D

INDIANA
A Report on the Limnology of Monroe Reservoir, Indiana,
W74-04792 2H

INDIRECT REUSE
An Assessment of the Use of Potomac Estuary Waters and AWT Effluents for Emergency Water Supply,
W74-04506 5D

INDUSTRIAL WASTES
Mechanical Clarification of Industrial Waste Waters (Mechanische Klaerung von Industrieabwaessern).
W74-04515 5D

Clarification Method of Polluted Water from Paper Mills With Combination of Beer Effluent (In Japanese),
W74-04528 5D

Hydrogen Peroxide for Industrial Pollution Control,
W74-04532 5D

Water Pollution in the Netherlands,
W74-04536 5B

Some Neglected Sources of Water Pollution (Nedostatochno uchityvayemyye istochniki zagryazneniya prirodnykh vod),
W74-04579 5B

Processes for Reducing the Organic-Carbon Content of Water Contaminated with Organic Compounds by Continuous Countercurrent Multistage Treatment with Activated Carbon,
W74-04704 5D

Apparatus for Treating Industrial and Domestic Waste Waters,
W74-04707 5D

INDUSTRIAL WATER
Catalytic Oxidation and Thermal Treatment of Waste Waters (Kataliticheskoe okislenie i termicheskoe obezvrezhivanie stochnykh vod),
W74-04537 5D

INFILTRATION
Soil Crusting Related to Sprinkler Intensity,
W74-04560 3F

INKS
Water Pollution in the Netherlands,
W74-04536 5B

INLETS (WATERWAYS)
Mechanical Bypassing of Littoral Drift at Inlets,
W74-04337 2L

Certain Structural and Developmental Coastal Features in the South of the Maritime Territory,
W74-04432 2J

Application of Fluorescent Coated Sand in Littoral Drift and Inlet Studies,

INSTITUTIONAL CONSTRAINTS
Institutional Framework Affecting the Use of Inland Wetlands in Massachusetts,
W74-04462 4A

What Do We Mean by Metropolitan Water Management Institutions.,
W74-04498 6E

INSTITUTIONAL RESTRAINTS
A Study of Water Institutions in Utah and Their Influence on the Planning, Developing, and Managing of Water Resources,
W74-04316 6E

INSTITUTIONS
Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

A Study of Water Institutions in Utah and Their Influence on the Planning, Developing, and Managing of Water Resources,
W74-04316 6E

What Do We Mean by Metropolitan Water Management Institutions.,
W74-04498 6E

INSTRUMENTATION
Evaluation of in Situ Creep Properties of Frozen Soils with the Pressuremeter,
W74-04377 2C

Linear Systems Technique Applied to Hydrologic Data Analysis and Instrument Evaluation: A Case Study on Data from the Alice Springs Area,
W74-04470 2A

Nucleonic Sediment Concentration Gauge - Comparison of Transmission and Scattering Modes,
W74-04774 2J

INSULATION
Control of Permafrost Degradation Beneath a Roadway by Subgrade Insulation,
W74-04409 4C

The Use of Polyurethane Foam Plastics in the Construction of Expedient Roads on Permafrost in Central Alaska,
W74-04421 8G

INTERNAL WAVES
Reproduction of Estuarine Structure and Current Observation Techniques in the Hecate Model,
W74-04724 2L

INTERNATIONAL COMMISSIONS
International Decade of Ocean Exploration.
W74-04473 6E

INTERNATIONAL DECADE OF OCEAN EXPLORATION
International Decade of Ocean Exploration.
W74-04473 6E

INTERNATIONAL WATERS
International Decade of Ocean Exploration.
W74-04473 6E

INVISCID INSTABILITY
On the Stability of Laminar Plumes: Some Numerical Solutions and Experiments,
W74-04662 5B

ION EXCHANGE
Aspects of Colour Removal from Pulp and Paper Mill Effluents,
W74-04514 5D

ION TRANSPORT
Ionic Mobility in Permafrost,
W74-04382 2C

IONIC MOBILITY
Ionic Mobility in Permafrost,
W74-04382 2C

IONIZATION
Mass Spectrometry and Inhomogeneous Ion Optics,
W74-04475 5A

IOWA
Hydrogeologic Considerations in Solid Waste Storage in Iowa: Part 1. Sanitary Landfill Site Selection: Part 2. A Method of Hazardous and Toxic Waste Disposal,
W74-04592 5E

Trickling Filter-Activated Sludge Combinations for Domestic Wastewater Treatment,
W74-04798 5D

Mississippian Aquifer of Iowa,
W74-04843 7C

IRAN
Groundwater Investigation and Management in Iran,
W74-04569 7B

IRON
200 MGD Activated Sludge Plant Removes Phosphorus by Pickle Liquor,
W74-04554 5D

Availability of Ground Water in the Winnsboro Area, Louisiana,
W74-04596 4B

IRON MANGANESE MICROORGANISMS
Overgrowth of Ooze Iron-Manganese Microorganisms Studied by Electron Microscopy, (In Russian),
W74-04558 5A

IRRIGATION
Application of Dynamic Programming in Markov Chains to the Evaluation of Water Quality in Irrigation,
W74-04561 3C

Results of Trials with Tobacco and Cotton Rotations Under Irrigation, (In Bulgarian),
W74-04825 3F

A Study on the Depth of Basic Tillage and Soil Fertilization for Maize Grown Under Irrigation, (In Bulgarian),
W74-04828 3F

Effect of Fertilizers and Irrigation Conditions on Yield, Chemical Composition, Baking Qualities of Winter Wheat Grain of Bezostaya 1 Cultivar, (In Russian),
W74-04830 3F

Productivity and Grain Qualities of Certain Newly Developed Native and Foreign Wheat Varieties Grown Under Irrigation, (In Bulgarian),
W74-04832 3F

IRRIGATION CANALS
The Rajasthan Canal Area: A Settlement Structure,
W74-04499 6D

IRRIGATION DISTRICTS
A Study of Water Institutions in Utah and Their Influence on the Planning, Developing, and Managing of Water Resources,
W74-04316 6E

The Rajasthan Canal Area: A Settlement Structure,
W74-04499 6D

IRRIGATION EFFICIENCY
Application of Regression Analysis to Estimation of the Efficiency of Water Use in Irrigation (Opyt primeneniya regressionnogo analiza k otsenke effektivnosti ispol'zovaniya vody pri oroshenii),
W74-04580 3F

IRRIGATION (FURROW)
Water Consumption and Biological Coefficient of Furrow and Sprinkler Irrigated Cotton, (In Bulgarian),
W74-04824 3F

IRRIGATION PRACTICES
A Simulation Model for Evaluating Irrigation Management Practices,
W74-04564 3F

Application of Regression Analysis to Estimation of the Efficiency of Water Use in Irrigation (Opyt primeneniya regressionnogo analiza k otsenke effektivnosti ispol'zovaniya vody pri oroshenii),
W74-04580 3F

IRRIGATION PROGRAMS
The Rajasthan Canal Area: A Settlement Structure,
W74-04499 6D

Cost-Benefit Analysis of Irrigation Projects in Northeastern Brazil,
W74-04565 3F

IRRIGATION SYSTEMS
A Simulation Model for Evaluating Irrigation Management Practices,
W74-04564 3F

IRRIGATION WATER
Economic Aspects of Ground Water Resources and Replacement Flows in Semiarid Agricultural Areas,
W74-04563 4B

ISLAND
Field Measurements of Swell Off the Island of Aruba,
W74-04723 2E

ISOLATION
Relative Efficiency of Cell Cultures for Detection of Viruses,
W74-04767 5A

ISOTOPE FRACTIONATION
Mass Spectrometry and Inhomogeneous Ion Optics,
W74-04475 5A

ISRAEL (LAKE KINNERET)
Chemical Ecology: Evidence for Phosphate as the Only Factor Limiting Algal Growth in Lake Kinneret,
W74-04685 5C

JAPAN
Strontium-90 and Cesium-137 Levels in Soils of Various Types at Niigata Prefecture, Japan,
W74-04453 5B

Field Investigation Practices of Coastal Studies in Japan,
W74-04625 2L

Suspended Sediment Due to Wave Action,
W74-04747 2J

Rhythmic Pattern of Longshore Bars Related to Sediment Characteristics,
W74-04750 2J

JAPAN (GO-NO-IKE LAKE)
Ecological Characteristics of Go-No-Ike Lake,
W74-04638 5C

JAPAN (KASHIMA HARBOR)
Hydraulic Model Experiment on the Duffusion Due to the Coastal Current,
W74-04628 5B

JETS
Zone of Flow Establishment for Round Buoyant Jets,
W74-04657 5B

On the Stability of Laminar Plumes: Some Numerical Solutions and Experiments,
W74-04662 5B

JUDICIAL DECISIONS
Southwestern Groundwater Law: A Textual and Bibliographic Interpretation,
W74-04460 4B

KALIHI STREAM (H
Baseline Quality Data for Kalihi Stream,
W74-04309 5B

KENTUCKY
A Detailed Investigation of the Sociological, Economic, and Ecological Aspects of Proposed Reservoir Sites in the Salt River Basin of Kentucky,
W74-04310 2A

Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

A History and Preliminary Inventory Report on the Kentucky Radioactive Waste Disposal Site,
W74-04442 5B

KENYA (LAKE NAKURU)
A Preliminary Survey of the Possible Contamination of Lake Nakuru in Kenya with Some Metals and Chlorinated Hydrocarbon Pesticides,
W74-04547 5C

KERATELLA-COCHLEARIS
Morphological Variation of Keratella cochlearis (Gosse) (Rotatoria) in Several Masurian Lakes of Different Trophic Level,
W74-04696 5C

KINETICS
Movements of Phosphorus Between its Biologically Important Forms in Lake Water,
W74-04783 5B

LABOR
Cost-Benefit Analysis of Irrigation Projects in Northeastern Brazil,
W74-04565 3F

LABORATORY EQUIPMENT
Apparatus for Recording Avoidance Movements of Fish,
W74-04776 5A

LABORATORY TESTS
Laboratory Study of Self-Sealing Limestone Plugs for Mine Openings,
W74-04559 5C

Laboratory Studies of the Accommodation o Some Crude and Residual Fuel Oils in Se Water,
W74-04775 5E

LACTATES
Effects of Cadmium and Copper on the Oxida tion of Lactate by Rainbow Trout (Salmo gaird nert) Gills,
W74-04780 5C

LAGOONS
Dynamics and Morphology of Sea Coasts.
W74-04425 2

Morphology and Evolution of aLagoon Coas on Sakhalin,
W74-04433 2

Boise Cascade Paper Mill and St. Helens Shar Treatment Lagoon.
W74-04535 5I

LAKE BAIKAL
Subglacial Development of Chlorella in Baika (In Russian),
W74-04647 2

LAKE BORULLUS (A
Fishery Survey Carried out at Lake Borullu A. R. E., in the Spring of 1971, (In Czech),
W74-04643 2

LAKE ERIE
Chemical Quality of Streams, Allegheny Riv Basin and Part of the Lake Erie Basin, Ne York,
W74-04593 2

LAKE GEORGE (NY)
A Field Study of Langmuir Circulations,
W74-04845 2

LAKE HURON
Currents at Harbor Beach, Michigan,
W74-04342 2

LAKE MENDOTA (WIS)
Detailed Time Variations in Mean Temperature and Heat Content of Some Madison Lakes,
W74-04659 2H

LAKE MICHIGAN
Aerial Radiological Measuring Survey of the Area Surrounding the Point Beach Nuclear Plant, Two Creeks, Wisconsin, August 16 and 17, 1970.
W74-04449 5A

A Numerical Model for Determining Integral Primary Production and Its Application to Lake Michigan,
W74-04786 5C

LAKE MONONA (WIS)
Detailed Time Variations in Mean Temperature and Heat Content of Some Madison Lakes,
W74-04659 2H

LAKE MORPHOLOGY
The Thermal Regime of Lake Lanao (Philippines) and its Theoretical Implications for Tropical Lakes,
W74-04665 2H

LAKE ONTARIO
Aerial Radiological Measuring Survey of the Area Surrounding the Robert Emmett Ginna Nuclear Power Plant, Ontario, New York, Sept. 8, 1970.
W74-04446 5A

Wave Action and Breakwater Design, Hamlin Beach Harbor, New York,
W74-04588 8B

LAKE SAMMAMISH (WASH)
Nutrient Income Change Related to Plankton Algae,
W74-04318 5C

LAKE SEDIMENTS
Distribution and Uptake of Artificially Introduced Radium-226 in a Small Lake,
W74-04785 5B

LAKE WAUBESA (WIS)
Detailed Time Variations in Mean Temperature and Heat Content of Some Madison Lakes,
W74-04659 2H

LAKES
Recharge of a Central Alaska Lake by Subpermafrost Groundwater,
W74-04394 2F

Relative Susceptibility of Lakes to Water-Quality Degradation in the Southern Hood Canal Area, Washington,
W74-04488 5B

Water Level Fluctuations of the Caspian Sea (K probleme urovennogo rezhima Kaspiyskogo morya),
W74-04575 2H

Measurement of Adenosine Triphosphate (ATP) in Two Precambrian Shield Lakes of Northwestern Ontario,
W74-04782 5B

Movements of Phosphorus Between its Biologically Important Forms in Lake Water,
W74-04783 5B

LAKES INVENTORY (COLO)
Lakes in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W74-04496 2H

LAMINAR FLOW
On the Stability of Laminar Plumes: Some Numerical Solutions and Experiments,
W74-04662 5B

Application of the Finite Element Method to Convection Heat Transfer Between Parallel Planes,
W74-04765 8B

LAMINAR PLUMES
On the Stability of Laminar Plumes: Some Numerical Solutions and Experiments,
W74-04662 5B

LAND APPLICATION (WASTE WATER)
Survey of Facilities Using Land Application of Wastewater,
W74-04677 5D

LAND DEVELOPMENT
Multipurpose Reservoirs and Urban Development,
W74-04319 6B

LAND MANAGEMENT
Permafrost Considerations in Land Use Planning Management,
W74-04361 2C

Survey of Facilities Using Land Application of Wastewater,
W74-04677 5D

LAND USE
Baseline Quality Data for Kalihi Stream,
W74-04309 5B

Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

Permafrost Considerations in Land Use Planning Management,
W74-04361 2C

Institutional Framework Affecting the Use of Inland Wetlands in Massachusetts,
W74-04462 4A

The Rajasthan Canal Area: A Settlement Structure,
W74-04499 6D

LAND VALUES
Land Value Increments as a Measure of the Net Benefits of Urban Water Supply Projects in Developing Countries: Theory and Measurement,
W74-04502 6B

LANDFILLS
Hydrogeologic Considerations in Solid Waste Storage in Iowa: Part 1. Sanitary Landfill Site Selection: Part 2. A Method of Hazardous and Toxic Waste Disposal,
W74-04592 5E

Hydrologic and Geologic Considerations for Solid-Waste Disposal in West-Central Florida,
W74-04605 5E

LANDSLIDES
A Numerical Classification of Selected Landslides of the Debris Slide-Avalanche-Flow Type,
W74-04591 2J

Waves Generated by Horizontal Motion of a Wall,
W74-04760 8B

LANGMUIR CIRCULATION
Wave Interaction and Langmuir Circulations,
W74-04844 2H

A Field Study of Langmuir Circulations,
W74-04845 2H

LEAD
Polluted Snow in Southern Norway During the Winters 1968-1971,
W74-04652 5B

LEAF
Contribution to Knowledge about the Leaf Anatomy of Species of a 'Caatinga' of the Rio Negro (Amazon), (In Portuguese),
W74-04682 2I

LEAKY AQUIFERS
The Response to Tidal Fluctuations of a Leaky Aquifer System,
W74-04308 2F

LEGAL ASPECTS
Southwestern Groundwater Law: A Textual and Bibliographic Interpretation,
W74-04460 4B

What's Wrong with Government Water Control Programs and how They can be Improved,
W74-04632 5D

LEGISLATION
Problem of Pure Water in the USA, (In Russian),
W74-04837 5G

LEGUMES
Effect of Long-Term Application of Variously High Rates of Nutrients on Natural Grassland Swards,
W74-04693 4A

Production Ability of Legumes, Grasses and Their Mixtures in Hill-Land Regions,
W74-04694 4A

LEVEES
Suspended and Bedload Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W74-04846 2J

LIBYA (BENGHAZI HARBOUR)
Waves Off Benghazi Harbour - Libya,
W74-04608 2L

LIGANDS
Determination of the Complexing Capacity of Natural Water,
W74-04312 2K

LIGHT
Effect of Light on Vulnerability of Heat-Stressed Sockeye Salmon to Predation by Coho Salmon,
W74-04671 5C

A Numerical Model for Determining Integral Primary Production and Its Application to Lake Michigan,
W74-04786 5C

LIGHT INTENSITY
Effect of Light Intensity on the Quality and Feeding Effectiveness of Green Fodder, (In Russian),
W74-04821 3F

LIGNINS
Color of Pulp Industry Waste Liquors. III. The Interaction of Chloro-Oxylignin with Metal Salts (In Japanese),
W74-04512 5D

Aspects of Colour Removal from Pulp and Paper Mill Effluents,
W74-04514 5D

LIME
Extensive Effluent Treatment at Hodge Includes Color Removal.
W74-04525 5D

Lime Disinfection of Sewage Bacteria at Low Temperature.
W74-04548 5D

LIMESTONES
Laboratory Study of Self-Sealing Limestone Plugs for Mine Openings,
W74-04559 5G

LIMNETIC ALGAE
The Analysis of Arsenic in the Lipid Phase from Marine and Limnetic Algae,
W74-04557 5A

LIMNOLOGY
The Thermal Regime of Lake Lanao (Philippines) and its Theoretical Implications for Tropical Lakes,
W74-04665 2H

A Report on the Limnology of Monroe Reservoir, Indiana,
W74-04792 2H

Wave Interaction and Langmuir Circulations,
W74-04844 2H

LINEAR PROGRAMMING
Cost-Benefit Analysis of Irrigation Projects in Northeastern Brazil,
W74-04565 3F

LINEAR SYSTEMS ANALYSIS
Linear Systems Technique Applied to Hydrologic Data Analysis and Instrument Evaluation: A Case Study on Data from the Alice Springs Area,
W74-04470 2A

LIPIDS
Analysis of Trace Elements, Phosphorus and Sulphur, in the Lipid and the Non-Lipid Phase of Halibut (Hippoglossus hippoglossus) and Tunny (Thunnus thynnus),
W74-04770 5A

LIQUID
Ecodistribution of Plutonium in Liquid Waste Disposal Areas at Los Alamos,
W74-04443 5B

LIQUIDS
A History and Preliminary Inventory Report on the Kentucky Radioactive Waste Disposal Site,
W74-04442 5B

LITTORAL
Theoretical Forms of Shorelines,
W74-04336 2J

Collective Movement of Sediment in Littoral Environment,
W74-04621 2J

Littoral Vegetation Overgrowing in Some Lakes of Kalinin District, (In Russina),
W74-04646 2H

Rhomboid Ripple Mark, Indicator of Current Direction and Environment,
W74-04739 2J

LITTORAL DRIFT
Littoral Transport in the Great Lakes,
W74-04334 2J

Mechanical Bypassing of Littoral Drift at Inlets,
W74-04337 2L

Shores and Shore Processes,
W74-04339 2L

Sediment Movement at Indian Ports,
W74-04345 2L

Morphology and Evolution of aLagoon Coast on Sakhalin,
W74-04433 2J

Submarine Sand Ridges as Indicators of Longshore Migration of Sediments,
W74-04434 2J

Application of Fluorescent Coated Sand in Littoral Drift and Inlet Studies,
W74-04616 2L

Quantitative Tracing of Littoral Drift,
W74-04617 2J

Littoral Drift as Function of Waves and Current,
W74-04623 2J

The Atlantic Coast of Long Island,
W74-04626 8A

Longshore Currents in One and Multi-Bar Profiles Relation to Littoral Drift,
W74-04749 2L

Rhythmic Pattern of Longshore Bars Related to Sediment Characteristics,
W74-04750 2J

Tracing Coastal Sediment Movement by Naturally Radioactive Minerals,
W74-04753 2J

Phenomena Affecting Improvement of the Lower Columbia Estuary and Entrance,
W74-04763 2L

LITTORAL TRANSPORT
Shore Transport. Formation of Sand Spits and Tombolos,
W74-04722 2J

LOCAL GOVERNMENTS
Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

LOCATION RENT GRADIENT
Estimating the Benefits of Stream Valley and Open Space Preservation Projects,
W74-04500 6B

LONG WAVES
Transformation, Breaking and Run-Up of a Long Wave of Finite Height,
W74-04741 2L

LONGSHORE CURRENTS
The Possibility of Predicting Longshore Currents in Tideless Seas,
W74-04439 2J

Littoral Drift as Function of Waves and Current,
W74-04623 2J

Hydraulic Model Experiment on the Duffusion Due to the Coastal Current,
W74-04628 5B

Longshore Currents in One and Multi-Bar Profiles Relation to Littoral Drift,
W74-04749 2L

LONGSHORE TRANSPORT
Quantitative Tracing of Littoral Drift,
W74-04617 2J

LOPHOBTANCHIATE
Syngnathus nigrolineatus nigrolineatus (Eichwald) in the Frasinet River and Mostistea Lake, (In Rumanian),
W74-04700 2I

LOUISIANA
Extensive Effluent Treatment at Hodge Includes Color Removal.
W74-04525 5D

Slope Development on a Mississippi River Bluff in Historic Time,
W74-04585 2J

Availability of Ground Water in the Winnsboro Area, Louisiana,
W74-04596 4B

Hypochlorination of Polluted Storm-Water Pumpage at New Orleans,
W74-04676 5D

LOUP RIVER (NEBR)
Characteristics of Streamflow at Gaging Stations in the Loup River Basin, Nebraska,
W74-04794 2E

LOW FLOW
Quantity and Chemical Quality of Low Flow in the East Fork San Jacinto and West Fork San Jacinto Rivers near Houston, Texas, June 24, 26, 1969,
W74-04481 5B

LOW TEMPERATURE
Lime Disinfection of Sewage Bacteria at Low Temperature.
W74-04548 5D

LUMBER
Water in Wood,
W74-04545 2I

MAGNETIC STUDIES
Electromagnetic Probing of Permafrost,
W74-04400 2C

MAHANTANGO WATERSHED (PENN)
Soluble Phosphate Output of an Agricultural Watershed in Pennsylvania,
W74-04804 5B

MANAGEMENT
Management of Stormwater Runoff in Suburban Environments,
W74-04302 5D

Optimal Operation of Multi-Reservoir Water Resources Systems,
W74-04314 4A

A Study of Water Institutions in Utah and Their Influence on the Planning, Developing, and Managing of Water Resources,
W74-04316 6E

A Simulation Model for Evaluating Irrigation Management Practices,
W74-04564 3F

Allocation of Scarce Resources to Agricultural Research: Review of Methodology,
W74-04566 3F

APPING
Remote Sensing in Sampling Site Location in Lakes and Streams,
W74-04313 5A

Indirect Mapping of the Snowcover for Permafrost Prediction at Schefferville, Quebec,
W74-04356 2C

Mapping and Predicting Permafrost in North America: A Review, 1963-1973,
W74-04398 2C

The Application of Shallow Seismic Methods to Mapping of Frozen Surficial Materials,
W74-04401 2C

Reconnaissance of the Ground-Water Resources of Cimarron County, Oklahoma,
W74-04495 4B

Lakes in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W74-04496 2H

APS
Surface-Water Availability, Lauderdale County, Alabama,
W74-04494 2E

ARINE ALGAE
The Analysis of Arsenic in the Lipid Phase from Marine and Limnetic Algae,
W74-04557 5A

ARINE BACTERIA
A Bacteriological Pressure-Retaining Deep-Sea Sampler and Culture Vessel,
W74-04773 5A

ARKOV PROCESSES
Application of Dynamic Programming in Markov Chains to the Evaluation of Water Quality in Irrigation,
W74-04561 3C

ARSH SANDPIPER
A Find of Marsh Sandpiper Tringa stagnatilis in the Netherlands,
W74-04681 5C

ARSHES
Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario,
W74-04478 5B

Death of the Marshes in the Ardennes,
W74-04686 4A

ARYLAND
Response and Recovery of a Piedmont Watershed from Tropical Storm Agnes, June 972,
W74-04805 2J

ASS SPECTROMETRY
Mass Spectrometry and Inhomogeneous Ion Optics,
W74-04475 5A

ASS TRANSFER
Application of the Finite Element Method to Convection Heat Transfer Between Parallel Planes,
W74-04765 8B

MASS TRANSPORT
A Study on Mass Transport in Boundary Layers in Standing Waves,
W74-04615 2J

MASS WASTING
Rates of Mass Wasting in the Ruby Range, Yukon Territory,
W74-04371 2J

MASSACHUSETTS
Institutional Framework Affecting the Use of Inland Wetlands in Massachusetts,
W74-04462 4A

Papermill Treatment Plant for Small Industry.
W74-04534 5D

MASTIGOCLADUS-LAMINOSUS
Concerning Large-Scale Cultivation of Thermophilic Cosmopolitan Mastigocladus Laminousus Cohn (Cyanophyta) in Icelandic Hot Springs,
W74-04486 2I

MATHEMATICAL MODELS
A Three-Dimensional Model for Estuaries and Coastal Seas: Volume I, Principles of Computation,
W74-04301 2L

Mathematical Modeling of Stream Storage Potential,
W74-04305 2E

The Response to Tidal Fluctuations of a Leaky Aquifer System,
W74-04308 2F

One-Dimensional Model of the Movement of Trace Radioactive Solute Through Soil Columns: The Percol Model,
W74-04444 5B

Effects of Urbanization on Floods in the Dallas, Texas, Metropolitan Area,
W74-04483 4C

Comments on Veronis' Paper, 'On Properties of Seawater Defined by Temperature, Salinity, and Pressure',
W74-04658 2K

The Application of Numerical Simulation Models in the Assessment of the Effect of Discharges into Coastal Waters,
W74-04674 5B

The Analysis of Harbor and Estuary Systems,
W74-04745 2L

A Numerical Model for Determining Integral Primary Production and Its Application to Lake Michigan,
W74-04786 5C

MEANDERS
The Fallacy of Baer's Law or Coriolis' Effect on the Meandering of Rivers,
W74-04799 8B

MEASUREMENT
Determination of Soil Moisture by Remote Sensing Techniques (Opredeleniye vlazhnosti pochvy distantsionnymi aerokosmicheskimi metodami),
W74-04576 2G

Measurements of the Turbulent Fluxes of Momentum, Moisture and Sensible Heat Over the Ocean,
W74-04673 2E

Nucleonic Sediment Concentration Gauge - Comparison of Transmission and Scattering Modes,
W74-04774 2J

MEASURING INSTRUMENTS
Waves Off Benghazi Harbour - Libya,
W74-04608 2L

MEDITERRANEAN CLIMATE
Application of Dynamic Programming in Markov Chains to the Evaluation of Water Quality in Irrigation,
W74-04561 3C

MEDUSA
Temperature Acclimation in the Medusa, Chrysaora quinquecirrha,
W74-04660 5C

MELT WATER
Effects of Stratigraphic Layers on Water Flow Through Snow,
W74-04572 2C

Water Flow Through Snow Overlying an Impermeable Boundary,
W74-04803 2C

MELTING
Thermokarst Development, Banks Island, Western Canadian Arctic,
W74-04368 2C

MEMBRANES
Water Cleaning Treatment,
W74-04710 3A

MERCURY
Characteristics of Pulp and Paper Mill Wastes and ISI Standards,
W74-04530 5B

Mercury Removal from Waste Water with Starch Xanthate-Cationic Polymer Complex,
W74-04541 5D

Mercury Uptake and Ion Distribution in Gills of Rainbow Trout (Salmo gairdneri): Tissue Scans with an Electron Microprobe,
W74-04778 5A

MERISTIC STRUCTURES
Effects of Temperature on Developing Meristic Structures of Smallmouth Bass, Micropterus dolomieui Lacepede,
W74-04663 5C

MESOTROPHY
Nutrient Income Change Related to Plankton Algae,
W74-04318 5C

METABOLISM
Changes in Enzymes in the Plant as Related to Water Supply and Usage,
W74-04306 2I

Temperature Acclimation in the Medusa, Chrysaora quinquecirrha,
W74-04660 5C

METAL IONS
Determination of the Complexing Capacity of Natural Water,
W74-04312 2K

METALLIC OXIDES
Mass Spectrometry and Inhomogeneous Ion Optics,
W74-04475 5A

METALLOGENIUM
Overgrowth of Ooze Iron-Manganese Microorganisms Studied by Electron Microscopy, (In Russian),
W74-04558 5A

METEOROLOGY
Trans-Pacific Fallout and Protective Countermeasures,
W74-04454 5B

METHOD VALIDATION
The Direct Enumeration of Escherichia coli in Water Using Macconkey's Agar at 44 C in Plastic Pouches,
W74-04768 5A

METHODOLOGY
Allocation of Scarce Resources to Agricultural Research: Review of Methodology,
W74-04566 3F

METHOXYCHLOR
The Effects of Methoxychlor on Aquatic Biota,
W74-04553 5C

METHYLMERCURY
Mercury Uptake and Ion Distribution in Gills of Rainbow Trout (Salmo gairdneri): Tissue Scans with an Electron Microprobe,
W74-04778 5A

MICHIGAN
Currents at Harbor Beach, Michigan,
W74-04342 5B

Mill's Waste Water Used for Spray Irrigation.
W74-04543 5D

MICROORGANISMS
Comparative Study, in 1966 and 1967, of Three Reservoirs in the Project of a Natural Park in the Morvan Region (In French),
W74-04815 5C

MINE SEALS
Laboratory Study of Self-Sealing Limestone Plugs for Mine Openings,
W74-04559 5G

MINE WATER
Some Neglected Sources of Water Pollution (Nedostatochno uchityvayemyye istochniki zagryazneniya prirodnykh vod),
W74-04579 5B

MINING
Stability of an Underground Room in Frozen Gravel,
W74-04418 2C

MINNESOTA
A Simulation Model for Evaluating Irrigation Management Practices,
W74-04564 3F

MISSISSIPPI
Hydraulic Performance of Bridges--Excavations at Bridges,
W74-04482 8B

MISSISSIPPI RIVER
Slope Development on a Mississippi River Bluff in Historic Time,
W74-04585 2J

MISSISSIPPI RIVER BASIN
Aerial Radiological Measuring Survey of the Area Surrounding the La Crosse Boiling Water Reactor, Genoa, Wisconsin, July 1968.
W74-04447 5A

MISSISSIPPIAN AQUIFER (IOWA)
Mississippian Aquifer of Iowa,
W74-04843 7C

MISSOURI
Summary Report of Metromex Studies, 1971-1972.
W74-04509 2B

MIXING
Mixing Processes,
W74-04327 5B

Estuarine Currents and Tidal Streams,
W74-04344 2L

Zone of Flow Establishment for Round Buoyant Jets,
W74-04657 5B

Reproduction of Estuarine Structure and Current Observation Techniques in the Hecate Model,
W74-04724 2L

Modeling of Turbulent Transport in the Surface Layer,
W74-04795 2D

MODEL STUDIES
Analytical Methods of Solution of Conjugated Problems in Convective Heat Transfer,
W74-04667 8B

Reproduction of Estuarine Structure and Current Observation Techniques in the Hecate Model,
W74-04724 2L

MOISTURE
Measurements of the Turbulent Fluxes of Momentum, Moisture and Sensible Heat Over the Ocean,
W74-04673 2E

MOISTURE CONTENT
Settlement Associated with the Thawing of Permafrost,
W74-04408 2C

Water in Wood,
W74-04545 2I

MOISTURE STRESS
Changes in Enzymes in the Plant as Related to Water Supply and Usage,
W74-04306 2I

Plant Responses to Water Stress,
W74-04539 2I

MOISTURE UPTAKE
Water in Wood,
W74-04545 2I

MOLEHILLS
Water Denudation of Molehills in Mountainous Areas,
W74-04639 2J

MONITORING
Aerial Radiological Measuring Survey of the Area Surrounding the La Crosse Boiling Water Reactor, Genoa, Wisconsin, July 1968.
W74-04447 5A

Aerial Radiological Measuring Survey of the Area Surrounding the Point Beach Nuclear Plant, Two Creeks, Wisconsin, August 16 and 17, 1970.
W74-04449 5A

Environmental Surveillance for Fuel Fabrication Plants,
W74-04451 5B

Environmental Radioactivity,
W74-04456 5B

MONROE RESERVOIR (IND)
A Report on the Limnology of Monroe Reservoir, Indiana,
W74-04792 2H

MONSOONS
Sediment Movement at Indian Ports,
W74-04345 2L

MONTANA
Evaluation of the Ground-Water Supply at Eight Sites in Glacier National Park, Northwestern Montana,
W74-04469 2F

Evaluation and Simulation of Chemical-Quality Data for Five Montana Sampling Stations,
W74-04484 2K

MORAN'S MODEL (DAMS)
Mathematical Modeling of Stream Storage Potential,
W74-04305 2E

MORTALITY
Thermal Responses in Cirrhina mrigala Fry,
W74-04661 5C

MOTHS
Role of Soil Conditions in the Development of Moths, (In Russian),
W74-04640 3F

MUDFLOWS
Mudflows (Selevyye potoki),
W74-04581 4D

MULTIPLE-PURPOSE RESERVOIRS
Multipurpose Reservoirs and Urban Development,
W74-04319 6B

Reservoirs of Europe and Some Aspects of Their Construction and Multipurpose Use (Vodokhranilishcha zarubezhnoy Yevropy nekotoryye voprosy ikh sozdaniya i kompleksnogo ispol'zovaniya),
W74-04582 8A

MUNICIPAL WATER
Evaluation of the Use of Pricing as a Tool for Conserving Water,
W74-04810 3B

MUSSELS
Ecological Investigations of Ponds with Special Regard to the Consequences of Water Pollution by Oil, (In German),
W74-04635 5

MUTANT VARIETIES
Drought Resistance of Radiation-Induced Mutant Varieties and Parent Forms of Cotton, (In Russian),
W74-04822 3

MYXOVIRUSES
Relative Efficiency of Cell Cultures for Detection of Viruses,
W74-04767 5

NATIONAL PARKS
Evaluation of the Ground-Water Supply at Eight Sites in Glacier National Park, Northwestern Montana,
W74-04469 2F

NATURAL RESOURCES
Cento Seminar on the Application of Remote Sensors in the Determination of natural Resources.
W74-04567 7B

NEARSHORE
Developmental History and Present-Day Dynamics of the Chushka Spit,
W74-04428 2J

NEARSHORE PROCESSES
Waves at Camp Pendleton, California,
W74-04607 2E

Laboratory Applications of Radioisotopic Tracers to Follow Beach Sediments,
W74-04751 2J

NEBRASKA
Characteristics of Streamflow at Gaging Stations in the Loup River Basin, Nebraska,
W74-04794 2E

NEEDLE ICE
A Simulation Sensitivity Analysis of the Needle Ice Growth Environment,
W74-04370 2C

NETARTS BAY (OREG)
Pink and Chum Salmon Culture,
W74-04797 8I

NETHERLANDS
Water Pollution in the Netherlands,
W74-04536 5B

A Find of Marsh Sandpiper Tringa stagnatilis in the Netherlands,
W74-04681 5C

Some Characteristics of the Dutch Coast,
W74-04754 2J

NETHERLANDS (BIESBOSCH)
Changes in the Avifauna of the Biesbosch in the 1st Yr After the Elimination of the Tide,
W74-04699 2I

NEW JERSEY
Numerical Computations of Storm Surges with Bottom Stress,
W74-04759 2L

NEW MEXICO
Ecodistribution of Plutonium in Liquid Waste Disposal Areas at Los Alamos,
W74-04443 5B

NEW RIVER (VA)
Hybridization Between the Darters Percina crassa roanoka and Percina oxyrhyncha (Percidae, Etheostomatini), with Comments on the Distribution of Percina crassa roanoka in New River,
W74-04472 2E

NEW YORK
Aerial Radiological Measuring Survey of the Area Surrounding the Robert Emmett Ginna Nuclear Power Plant, Ontario, New York, Sept. 8, 1970.
W74-04446 5A

Syracuse Metropolitan Area Comprehensive Plan-Water and Sewer Plan and Services Allocation Plan,
W74-04507 5D

Wave Action and Breakwater Design, Hamlin Beach Harbor, New York,
W74-04588 8B

Chemical Quality of Streams, Allegheny River Basin and Part of the Lake Erie Basin, New York,
W74-04593 2K

The Atlantic Coast of Long Island,
W74-04626 8A

A Field Study of Langmuir Circulations,
W74-04845 2H

NEW YORK BAY
Hurricane Tide Prediction for New York Bay,
W74-04343 2L

NEW ZEALAND (HAWKE BAY)
Sedimentation in Hawke Bay,
W74-04726 2L

NEW ZEALAND (MILFORD SOUND)
Studies of a Southern Fiord.
W74-04727 2J

NICARAGUA (MANAGUA)
Prediction of the 1972 Managua, Nicaragua, Earthquake from Groundwater Changes, Inferred Probability of Earthquakes in the City of Managua, Nicaragua, during the Summer of 1973,
W74-04467 2F

NILE DELTA
Fishery Survey Carried out at Lake Borullus, A. R. E., in the Spring of 1971, (In Czech),
W74-04643 2H

NITRATES
Radiological Status of the Groundwater Beneath the Hanford Project, July-December 1972,
W74-04452 5B

Chemical Ecology: Evidence for Phosphate as the Only Factor Limiting Algal Growth in Lake Kinneret,
W74-04685 5C

Eutrophication of Lake 227 by Addition of Phosphate and Nitrate: The Second, Third, and Fourth Years of Enrichment, 1970, 1971, and 1972,
W74-04789 5C

NITROGEN
Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario,
W74-04478 5B

Production Ability of Legumes, Grasses and Their Mixtures in Hill-Land Regions,
W74-04694 4A

Horizontal Distribution of Some Chemical and Physical Characteristics in Lipno Reservoir,
W74-04814 5C

NITROGEN COMPOUNDS
Paper Mill Sludge Disposal on Soils: Effects on the Yield and Mineral Nutrition of Oats (Avena sativa.),
W74-04519 5E

NON-STRUCTURAL ALTERNATIVES
Flood Proofing Decisions Under Uncertainty: An Application to the Connecticut River Basin,
W74-04463 6A

NORTH AMERICA
Permafrost: North American Contribution to Second International Conference.
W74-04346 2C

Distribution of Permafrost in North America and Its Relationship to the Environment: A Review, 1963-1973,
W74-04353 2C

NORTH CARLOINA
Determination of the Complexing Capacity of Natural Water,
W74-04312 2K

NORTH CAROLINA
Multipurpose Reservoirs and Urban Development,
W74-04319 6B

NORTHERN PIKE
Temperature Requirements for Embryos and Larvae of the Northern Pike, Esox lucius (Linnaeus),
W74-04670 5C

NORWAY
Polluted Snow in Southern Norway During the Winters 1968-1971,
W74-04652 5B

NOTOTHENIA-ROSSI-MARMORATA
Daily Diet and Rate of Feeding of Notothenia rossi marmorata Fischer and Dissostichus eleginoides Smitt, Family Nototheniidae, in the Area of Southern Georgia (USSR), (In Russian),
W74-04679 2I

NUCLEAR EXPLOSIONS
Strontium-90 and Cesium-137 Levels in Soils of Various Types at Niigata Prefecture, Japan,
W74-04453 5B

Trans-Pacific Fallout and Protective Countermeasures,
W74-04454 5B

NUCLEAR POWERPLANT
Aerial Radiological Measuring Survey of the Area Surrounding the Point Beach Nuclear Plant, Two Creeks, Wisconsin, August 16 and 17, 1970.
W74-04449 5A

NUCLEAR POWERPLANTS
Aerial Radiological Measuring Survey of the Area Surrounding the Robert Emmett Ginna Nuclear Power Plant, Ontario, New York, Sept. 8, 1970.
W74-04446 5A

Aerial Radiological Measuring Survey of the Area Surrounding the La Crosse Boiling Water Reactor, Genoa, Wisconsin, July 1968.
W74-04447 5A

Aerial Radiological Measuring Survey of the Area Surrounding the Vermont Yankee Generating Station and the Yankee Nuclear Power Station, September 18, 1970.
W74-04448 5A

Environmental Surveillance for Fuel Fabrication Plants,
W74-04451 5B

Industry Awaits Solutions to Problems of High-Level Radioactive-Waste Management,
W74-04457 5D

Reviewing Environmental Impact Statements-Power Plant Cooling Systems, Engineering Aspects,
W74-04555 5G

NUCLEAR REACTORS
Environmental Monitoring and Disposal of Radioactive Wastes from U.S. Naval Nuclear-Powered Ships and Their Support Facilities, 1972,
W74-04441 5B

Breeder Reactors: Power for the Future,
W74-04656 8C

NUCLEONIC GAUGE
Nucleonic Sediment Concentration Gauge - Comparison of Transmission and Scattering Modes,
W74-04774 2J

NUMERICAL ANALYSIS
A Three-Dimensional Model for Estuaries and Coastal Seas: Volume I, Principles of Computation,
W74-04301 2L

Application of the Concept of Rectilinear Vortices to the Movement of Oil Slicks,
W74-04490 5B

NUMERICAL WAVE THEORY
Breaking Wave Criteria; A Study Employing a Numerical Wave Theory,
W74-04610 2E

NUTRIENTS
Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario,
W74-04478 5B

Effect of Long-Term Application of Variously High Rates of Nutrients on Natural Grassland Swards,
W74-04693 4A

Production Ability of Legumes, Grasses and Their Mixtures in Hill-Land Regions,
W74-04694 4A

The Transport of Organic Carbon to Organisms Living in the Deep Oceans,
W74-04790 5C

Utilization of Nutrients from Soil and Fertilizers by Pasture Grass as Dependent on Soil Moisture (In Russian),
W74-04820 4A

Nutrient Uptake by Winter Wheat in a Zone of Unstable Moisture, (In Russian),
W74-04827 3F

OATS
Paper Mill Sludge Disposal on Soils: Effects on the Yield and Mineral Nutrition of Oats (Avena sativa.),
W74-04519 5E

OCEAN CIRCULATION
Comments on Johnson's Paper, 'On the Wind-Driven Circulation of a Stratified Ocean',
W74-04675 2E

OCEAN WAVES
Physical and Dynamical Scales for Generation of Wind Waves,
W74-04330 2E

Laboratory Experiments to Determine the Structural Response of a Vertical Pile Subjected to Wind-Generated Water Waves,
W74-04424 8B

The Elevation, Slope, and Curvature Spectra of a Wind Roughened Sea Surface,
W74-04476 2E

Waves at Camp Pendleton, California,
W74-04607 2E

OCEANOGRAPHY
International Decade of Ocean Exploration.
W74-04473 6E

OCEANS
Measurements of the Turbulent Fluxes of Momentum, Moisture and Sensible Heat Over the Ocean,
W74-04673 2E

OFFSHORE PLATFORMS
Laboratory Experiments to Determine the Structural Response of a Vertical Pile Subjected to Wind-Generated Water Waves,
W74-04424 8B

OIL FIELDS
Permafrost Protection for Pipelines,
W74-04415 2C

Permafrost-Related Engineering Geology Problems Posed by the Trans-Alaska Pipeline,
W74-04416 8D

Effects of Ground-Ice Variability and Resulting Thaw Settlements on Buried Warm-Oil Pipelines,
W74-04422 4C

Performance of a Warm-Oil Pipeline Buried in Permafrost,
W74-04423 8D

OIL INDUSTRY
Laboratory Experiments to Determine the Structural Response of a Vertical Pile Subjected to Wind-Generated Water Waves,
W74-04424 8B

OIL POLLUTION
Ecological Investigations of Ponds with Special Regard to the Consequences of Water Pollution by Oil, (In German),
W74-04635 5C

Anti-Pollution Barrier,
W74-04705 5G

Anti-Pollution Barge and Conveyer Assembly,
W74-04718 5G

Laboratory Studies of the Accommodation of Some Crude and Residual Fuel Oils in Sea Water,
W74-04775 5B

Problem of Pure Water in the USA, (In Russian),
W74-04837 5G

OIL SPILLS
Application of the Concept of Rectilinear Vortices to the Movement of Oil Slicks,
W74-04490 5B

Anti-Pollution Barrier,
W74-04705 5G

Anti-Pollution Barge and Conveyer Assembly,
W74-04718 5G

OIL WASTES
Waste Automotive Lubricating Oil as a Municipal Incinerator Fuel,
W74-04549 5D

Laboratory Studies of the Accommodation of Some Crude and Residual Fuel Oils in Sea Water,
W74-04775 5B

OKLAHOMA
Reconnaissance of the Ground-Water Resources of Cimarron County, Oklahoma,
W74-04495 4B

OLIVE-GREEN CELLS
The Transport of Organic Carbon to Organisms Living in the Deep Oceans,
W74-04790 5C

ON-SITE DATA COLLECTIONS
A Radiological Environmental Survey at EBR-II,
W74-04455 5B

OPERATING COSTS
Low Cost Methods for Treating Pulp and Paper Mill Effluents,
W74-04531 5D

OPERATION AND MAINTENANCE
Water Reuse and Deposits Control,
W74-04520 5D

OPTIMIZATION
Optimal Operation of Multi-Reservoir Water Resources Systems,
W74-04314 4A

OPTIMUM DEVELOPMENT PLANS
A Design Procedure for the Conjunctive Use of Surface and Groundwater Storages,
W74-04598 4B

OREGON
Willamette Cleanup,
W74-04522 5D

Boise Cascade Paper Mill and St. Helens Share Treatment Lagoon.
W74-04535 5D

Inshore Sea Surface Temperature and Salinity Conditions at Agate Beach, Yaquina Bay and Whale Cove, Oregon, in 1970,
W74-04730 2L

Pink and Chum Salmon Culture,
W74-04797 8I

ORGANIC CARBON
Heterotrophic Utilization of Sucrose in an Artificially Enriched Lake,
W74-04781 5C

The Transport of Organic Carbon to Organisms Living in the Deep Oceans,
W74-04790 5C

Ratio of Organic Carbon with Different Types of Oxidizability in the Open Water of Baikal (In Russian),
W74-04819 5C

ORGANIC COMPOUNDS
Analysis of Organic Pollutants in Water and Waste Water,
W74-04633 5A

Processes for Reducing the Organic-Carbon Content of Water Contaminated with Organic Compounds by Continuous Countercurrent Multistage Treatment with Activated Carbon,
W74-04704 5D

Hydrocarbon and Chlorophyll: A Correlation in the Upwelling Region off West Africa,
W74-04771 5B

The Effect of Water Spraying on the Reinforcement of Physiological Process in Cotton Plants,
W74-04823 3F

ORGANIC MATTER
Process for Purifying Water that Contains Organic Matter,
W74-04716 5D

Micro- and Mesobenthos Development as a Factor of Soil Composition (In Russian),
W74-04816 2H

Distribution of Organic Matter and Bacteria in the Upper Layer of Bottom Deposit of Lake Balaton,
W74-04839 5B

ORGANIZATIONS
What Do We Mean by Metropolitan Water Management Institutions.,
W74-04498 6E

ORGANOPHOSPHORUS COMPOUNDS
Movements of Phosphorus Between its Biologically Important Forms in Lake Water,
W74-04783 5B

OSCILLATORY WAVES
Effect of Beach Slope and Shoaling on Wave Asymmetry,
W74-04612 2E

OUTFALL SEWERS
Mixing Processes,
W74-04327 5B

Buoyancy Spread of Waste Water in Coastal Regions,
W74-04630 5B

OVERLAND FLOW
Effects of Permafrost on Stream Flow Characteristics in the Discontinuous Permafrost Zone of Central Alaska,
W74-04392 2C

Spring Runoff From Hillslopes, Small Watersheds, and River Basins (Vesenniy stok so sklonov, malykh vodosborov, rechnykh basseynov),
W74-04577 2E

OWNERSHIP COSTS
Institutional Framework Affecting the Use of Inland Wetlands in Massachusetts,
W74-04462 4A

OXIDATION
Hydrogen Peroxide for Industrial Pollution Control,
W74-04532 5D

Catalytic Oxidation and Thermal Treatment of Waste Waters (Kataliticheskoe okislenie i termicheskoe obezvrezhivanie stochnykh vod),
W74-04537 5D

Effects of Cadmium and Copper on the Oxidation of Lactate by Rainbow Trout (Salmo gairdnert) Gills,
W74-04780 5C

Ratio of Organic Carbon with Different Types of Oxidizability in the Open Water of Baikal (In Russian),
W74-04819 5C

OXIDATION PONDS
Role of Phyto- and Zooplankton in Self-Purification Processes (Exemplified by Oxidation Ponds), (In Russian),
W74-04692 5G

OXIDES
Hydrogen Peroxide for Industrial Pollution Control,
W74-04532 5D

OXYGEN
The Use of Computer Simulations for Systems Ecological Studies in the Baltic,
W74-04634 5B

OXYGENATION
Apparatus for Treating Industrial and Domestic Waste Waters,
W74-04707 5D

OZONIZATION
Ozonization as a Method of Purifying Water Polluted with Chemical Composition, (In Russian),
W74-04836 5D

PADDY FIELD
A Study on the Accuracy of Runoff Analysis for Pumping Drainage in Paddy Field Area (In Japanese),
W74-04811 4A

PALEOCLIMATOLOGY
Postglacial Permafrost Features in Eastern Canada,
W74-04358 2C

PALEOHYDROLOGY
Paleohydrology and Sedimentology of Lake Missoula Flooding in Eastern Washington,
W74-04599 2E

PARASITE
Parasite Fauna of Ctenopharyngodon idella from Pond- and Spawning-Nursery Fisheries in the Volga Delta, (In Russian),
W74-04702 8I

PARKS
Estimating the Benefits of Stream Valley and Open Space Preservation Projects,
W74-04500 6B

PARLANGE'S METHOD
On Solving the Unsaturated Flow Equation: 2. Critique of Parlange's Method.
W74-04492 2G

PARTICLE SIZE
The Effect of Collecting Time and Grain Size on the Sampling of Stream Sediments for Geochemical Mapping in the St. Catharines Area, Ontario,
W74-04587 2J

Laboratory Study of Scale Effects in Two-Dimensional Beach Processes,
W74-04748 2L

PASTURE GRASS
Utilization of Nutrients from Soil and Fertilizers by Pasture Grass as Dependent on Soil Moisture (In Russian),
W74-04820 4A

PATENTS
Processes for Reducing the Organic-Carbon Content of Water Contaminated with Organic Compounds by Continuous Countercurrent Multistage Treatment with Activated Carbon,
W74-04704 5D

Anti-Pollution Barrier,
W74-04705 5G

Water Purification,
W74-04706 5F

Apparatus for Treating Industrial and Domestic Waste Waters,
W74-04707 5D

Sedimentation Tanks,
W74-04708 5D

Method and Apparatus for the Biological Treatment of Waste Water,
W74-04709 5D

Water Cleaning Treatment,
W74-04710 3A

Floating Breakwater Pontoon,
W74-04711 8B

Screening Aerator Concentrator,
W74-04712 5D

Skimmer Trap,
W74-04713 5G

Method and Apparatus for Treating Effluent,
W74-04714 5D

Conduit Structure for Migrating Fish,
W74-04715 8I

Process for Purifying Water that Contains Organic Matter,
W74-04716 5D

Method of Treating Sewage Using High Polymer Ratio Flocculation Agent Biologically Produced in Situ,
W74-04717 5D

Anti-Pollution Barge and Conveyer Assembly,
W74-04718 5G

Apparatus for Treating Waste Fluids by Means of Dissolved Gases,
W74-04719 5D

Solar Distillation Apparatus,
W74-04720 3A

PATH OF POLLUTANTS
Baseline Quality Data for Kalihi Stream,
W74-04309 5B

One-Dimensional Model of the Movement of Trace Radioactive Solute Through Soil Columns: The Percol Model,
W74-04444 5B

Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario,

Benefit of Water Pollution Control on Property Values,
W74-04550 5G

Skimmer Trap,
W74-04713 5G

Method and Apparatus for Treating Effluent,
W74-04714 5D

Anti-Pollution Barge and Conveyer Assembly,
W74-04718 5G

Apparatus for Treating Waste Fluids by Means of Dissolved Gases,
W74-04719 5D

POLYACRYLONITRILE
Application of Polyacrylamide to Pulp Mill Effluents (In Japanese),
W74-04529 5D

POLYMERS
Mercury Removal from Waste Water with Starch Xanthate-Cationic Polymer Complex,
W74-04541 5D

PORE PRESSURE
Soil Freezing in Relation to Pore Water Pressure and Temperature,
W74-04381 2C

Pore Water and Heaving Pressures Developed in Partially Frozen Soils,
W74-04389 2C

Groundwater Pore Pressures Adjacent to Subarctic Streams,
W74-04393 2C

PORE WATER
Soil Freezing in Relation to Pore Water Pressure and Temperature,
W74-04381 2C

Ionic Mobility in Permafrost,
W74-04382 2C

POROSITY
Effect of Porosity on Amount of Soil Water Transferred in a Freezing Silt,
W74-04376 2C

POROUS MEDIA
Effects of Salt Concentration Changes During Freezing on the Unfrozen Water Content of Porous Materials,
W74-04802 2C

PORTS
Effect of Entrance on Seiche Motion in Ocean Ports,
W74-04743 2L

POTATO
Influence of Soil Moisture Conditions on Growth and Development of the Potato Solanum tuberosum L.,
W74-04687 3F

POTOMAC RIVER
An Assessment of the Use of Potomac Estuary Waters and AWT Effluents for Emergency Water Supply,
W74-04506 5D

POWER SPECTRA
Investigation of Seiche Activity in West Coast Harbors,
W74-04744 2L

POWERPLANTS
Suspended Sediment Due to Wave Action,
W74-04747 2J

PRE-IMPOUNDMENT
A Detailed Investigation of the Sociological, Economic, and Ecological Aspects of Proposed Reservoir Sites in the Salt River Basin of Kentucky,
W74-04310 2A

Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

PRECIPITATION (ATMOSPHERIC)
Hydrology of the Central Arctic River Basins of Alaska,
W74-04304 2A

PREDATION
Effect of Light on Vulnerability of Heat-Stressed Sockeye Salmon to Predation by Coho Salmon,
W74-04671 5C

PRESSURE
The Determination of Maximum Wave Velocities in the Shore Zone of the Sea,
W74-04437 2J

PRESSURIZED WATER REACTOR
Aerial Radiological Measuring Survey of the Area Surrounding the Robert Emmett Ginna Nuclear Power Plant, Ontario, New York, Sept. 8, 1970.
W74-04446 5A

PRICING
Evaluation of the Use of Pricing as a Tool for Conserving Water,
W74-04810 3D

PRIMARY PRODUCTION
Relation Between the Amount of Net Zooplankton and the Depth of Station in Shallow Lipno Reservoir,
W74-04680 5C

PRIMARY PRODUCTIVITY
Measurement of Adenosine Triphosphate (ATP) in Two Precambrian Shield Lakes of Northwestern Ontario,
W74-04782 5B

Diurnal Variation of Dissolved Inorganic Carbon and its Use in Estimating Primary Production and CO2 Invasion in Lake 227,
W74-04784 5A

A Numerical Model for Determining Integral Primary Production and Its Application to Lake Michigan,
W74-04786 5C

Production of Epilithiphyton in Two Lakes of the Experimental Lakes Area, Northwestern Ontario,
W74-04787 5C

Eutrophication of Lake 227 by Addition of Phosphate and Nitrate: The Second, Third, and Fourth Years of Enrichment, 1970, 1971, and 1972,
W74-04789 5C

PRINTING INDUSTRY
Water Pollution in the Netherlands,
W74-04536 5B

PRIOR APPROPRIATION
Southwestern Groundwater Law: A Textual and Bibliographic Interpretation,
W74-04460 4B

PRODUCTION
Production Ability of Legumes, Grasses and Their Mixtures in Hill-Land Regions,
W74-04694 4A

PRODUCTIVITY
Ecological Characteristics of Go-No-Ike Lake,

The Water Balance in Arctic and Subarctic Regions--Annotated Bibliography and Preliminary Assessment,
W74-04601 2C

Heat - A Growing Water Pollution Problem,
W74-04668 5B

RHEOLOGY
Evaluation of in Situ Creep Properties of Frozen Soils with the Pressuremeter,
W74-04377 2C

Viscoelastic Properties of Frozen Soil Under Vibratory Loads,
W74-04388 8D

RICE
Effects of Flooding and Draining and Their Alternation on the Growth and Uptake of Nutrients by Rice (Oryza Sativa L., Indica Var. IR-8),
W74-04826 3F

Rainfed Rice in Southern Senegal: Evaluation of Three Years' Experimentation (1966-1969), (In French),
W74-04829 3F

RIP CURRENTS
Longshore Currents in One and Multi-Bar Profiles Relation to Littoral Drift,
W74-04749 2L

RIPPLE MARKS
Rhomboid Ripple Mark, Indicator of Current Direction and Environment,
W74-04739 2J

A Study of Critical Depth and Mode of Sand Movement Using Radioactive Glass Sand,
W74-04752 2J

RIPPLES
Certain Aspects of the Interaction Between Wave Flow and a Deformable Bottom at Low Velocities,
W74-04435 2J

RISKS
Flood Proofing Decisions Under Uncertainty: An Application to the Connecticut River Basin,
W74-04463 6A

RIVER BASINS
Hydrology of the Central Arctic River Basins of Alaska,
W74-04304 2A

Water Problems of the Tisza River in Hungary and Cooperation Among Tisza Basin Countries in the Field of Water Management (Vodnyye problemy reki Tisy v Vengrii i sotrudnichestvo stran basseyna Tisy v oblasti vodnogo khozvayst va),
W74-04574 4A

Spring Runoff From Hillslopes, Small Watersheds, and River Basins (Vesenniy stok so sklonov, malykh vodosborov, rechnykh basseynov),
W74-04577 2E

Water Quality Improvement in River Basins (Experience of Industrialized Countires) (O povyshenii kachestva vody v rechnykh basseynakh (Opyt industrial'nykh stran)),
W74-04583 5G

Chemical Quality of Streams, Allegheny River Basin and Part of the Lake Erie Basin, New York,
W74-04593 2K

RIVER BEDS
Effect of the Forest on the Displacement of the Desna River Bed and the Significance of this Effect on Forest Planting in the Floodplain, (In Russian),
W74-04641 4A

RIVER SYSTEMS
Topology of River Systems and Hydrographic Indicator Studies (Topologiya rechnykh sistem i gidrograficheskiye indikatsionnyye issledovaniya),
W74-04578 2A

RIVERS
The Fallacy of Baer's Law or Coriolis' Effect on the Meandering of Rivers,
W74-04799 8B

ROAD CONSTRUCTION
Some Passive Methods of Controlling Geocryological Conditions in Roadway Construction,
W74-04406 2C

Control of Permafrost Degradation Beneath a Roadway by Subgrade Insulation,
W74-04409 4C

Corps of Engineers Technology Related to Design of Pavements in Areas of Permafrost,
W74-04414 4C

Encountering Massive Ground Ice During Road Construction in Central Alaska,
W74-04420 4C

The Use of Polyurethane Foam Plastics in the Construction of Expedient Roads on Permafrost in Central Alaska,
W74-04421 8G

ROCK MECHANICS
Mechanical Properties of Rocks at Low Temperatures,
W74-04380 2C

ROCKY MOUNTAIN REGION
Permafrost and Its Relationship to Other Environmental Parameters in a Midlatitude, High-Altitude Setting, Front Range, Colorado Rocky Mountains,
W74-04357 2C

Managing Growth in a Fragile Environment: Problems of the Rocky Mountain States,
W74-04505 6D

RODENTS
Annual Consumption of Cesium-137 and Cobalt-60 Labeled Pine Seeds by Small Mammals in an Oak-Hickory Forest,
W74-04450 5B

ROMANIA
Syngnathus nigrolineatus nigrolineatus (Eichwald) in the Frasinet River and Mostistea Lake, (In Rumanian),
W74-04700 2I

ROOTS
Water Withdrawal by Plant Roots,
W74-04655 3F

ROTATORIA
Morphological Variation of Keratella cochlearis (Gosse) (Rotatoria) in Several Masurian Lakes of Different Trophic Level,
W74-04696 5C

ROUGHNESS (SEA-SURFACE)
The Elevation, Slope, and Curvature Spectra of a Wind Roughened Sea Surface,
W74-04476 2E

RUBY MOUNTAINS (CANADA)
Rates of Mass Wasting in the Ruby Range, Yukon Territory,
W74-04371 2J

RUNOFF
Surface-Water Availability, Lauderdale County, Alabama,
W74-04494 2E

Spring Runoff From Hillslopes, Small Watersheds, and River Basins (Vesenniy stok so sklonov, malykh vodosborov, rechnykh basseynov),
W74-04577 2E

RURAL WATER SUPPLY
Community Water Supply.
W74-04510 4B

RUTHENIUM
Radiological Status of the Groundwater Beneath the Hanford Project, July-December 1972,
W74-04452 5B

RYE
A Comparative Study of the Size and Receptivity of the Stigma in Wheat, Rye, Triticale and Secalotricum,
W74-04690 3F

SAGAVANIRKTOK RIVER (ALASKA)
A Groundwater Supply for an Oil Camp Near Prudhoe Bay, Arctic Alaska,
W74-04396 2F

SALINE ICE
Ice Engineering--Summary of Elastic Properties Research and Introduction to Viscoelastic and Nonlinear Analysis of Saline Ice,
W74-04793 2C

SALINE WATER
Application of Dynamic Programming in Markov Chains to the Evaluation of Water Quality in Irrigation,
W74-04561 3C

Effects of Salt Concentration Changes During Freezing on the Unfrozen Water Content of Porous Materials,
W74-04802 2C

SALINE WATER-FRESHWATER INTERFACES
The Nature of the Seawater-Freshwater Interface During Breakup in the Colville River Delta, Alaska,
W74-04397 2C

SALINE WATER INTRUSION
The Nature of the Seawater-Freshwater Interface During Breakup in the Colville River Delta, Alaska,
W74-04397 2C

Phenomena Affecting Improvement of the Lower Columbia Estuary and Entrance,
W74-04763 2L

SALINITY
Comments on Veronis' Paper, 'On Properties of Seawater Defined by Temperature, Salinity, and Pressure',
W74-04658 2K

Inshore Sea Surface Temperature and Salinity Conditions at Agate Beach, Yaquina Bay and Whale Cove, Oregon, in 1970,
W74-04730 2L

New Dimensions in Estuary Classification,
W74-04735 2L

SALMON
Effect of Light on Vulnerability of Heat-Stressed Sockeye Salmon to Predation by Coho Salmon,
W74-04671 5C

SALMONELLA ISOLATION
Problem of Isolating Salmonella from Surface Waters Exemplified by Long-Term Studies in the Berlin Area, Capital of the German Democratic Republic, (In German),
W74-04835 5A

SALMONELLA SEROTYPES
Salmonella Serotypes in Sewage of Various Origins,
W74-04850 5B

SALT BALANCE
New Dimensions in Estuary Classification,
W74-04735 2L

SALT RIVER BASIN (KY
A Detailed Investigation of the Sociological, Economic, and Ecological Aspects of Proposed Reservoir Sites in the Salt River Basin of Kentucky,
W74-04310 2A

SAMPLING
Remote Sensing in Sampling Site Location in Lakes and Streams,
W74-04313 5A

Sample Disturbance and Thaw Consolidation of a Deep Sand Permafrost,
W74-04387 2C

Scanning Electron Microscopy of Fixed, Frozen, and Dried Protozoa,
W74-04497 7B

The Effect of Collecting Time and Grain Size on the Sampling of Stream Sediments for Geochemical Mapping in the St. Catharines Area, Ontario,
W74-04587 2J

A Bacteriological Pressure-Retaining Deep-Sea Sampler and Culture Vessel,
W74-04773 5A

SAN ANTONIO (TEX)
Optimal Operation of Multi-Reservoir Water Resources Systems,
W74-04314 4A

SAN FRANCISCO BAY (CA)
Constituent Transport in Estuaries,
W74-04627 2L

SAN JACINTO RIVER (TEX)
Quantity and Chemical Quality of Low Flow in the East Fork San Jacinto and West Fork San Jacinto Rivers near Houston, Texas, June 24, 26, 1969,
W74-04481 5B

SAND BARS
Dynamics and Morphology of Sea Coasts.
W74-04425 2J

Collective Movement of Sediment in Littoral Environment,
W74-04621 2J

Laboratory Study of Scale Effects in Two-Dimensional Beach Processes,
W74-04748 2L

Rhythmic Pattern of Longshore Bars Related to Sediment Characteristics,
W74-04750 2J

SAND BYPASSING
Mechanical Bypassing of Littoral Drift at Inlets,
W74-04337 2L

Application of Fluorescent Coated Sand in Littoral Drift and Inlet Studies,
W74-04616 2L

SAND SPITS
Developmental History and Present-Day Dynamics of the Chushka Spit,
W74-04428 2J

Recent Development of the Temryuk Coast on the Azov Sea,
W74-04430 2J

Shore Transport. Formation of Sand Spits and Tombolos,
W74-04722 2J

SAND WAVES
Submarine Sand Ridges as Indicators of Longshore Migration of Sediments,
W74-04434 2J

Collective Movement of Sediment in Littoral Environment,
W74-04621 2J

SANDS
Studies on the Validity of Darcy's Law for Flow in Natural Sands,
W74-04307 2F

Triaxial and Creep Tests on Frozen Ottawa Sand,
W74-04386 2C

Rhomboid Ripple Mark, Indicator of Current Direction and Environment,
W74-04739 2J

Development and Geologic Significance of Soft Beach Sand,
W74-04757 2J

SANITARY ENGINEERING
An Experiment in Sanitary-Virological Research on Sewage, (In Russian),
W74-04849 5B

SANTA MONICA BAY (CALIF)
Study of Beach Widening By the Perched Beach Concept, Santa Monica Bay, California,
W74-04603 8B

SATELLITES (ARTIFICIAL)
Air Pollution Measurements From Satellites,
W74-04485 5A

Determination of Soil Moisture by Remote Sensing Techniques (Opredeleniye vlazhnosti pochvy distantsionnymi aerokosmicheskimi metodami),
W74-04576 2G

SCANNING ELECTRON MICROSCOPES
Scanning Electron Microscopy of Fixed, Frozen, and Dried Protozoa,
W74-04497 7B

SCOUR
Hydraulic Performance of Bridges--Excavations at Bridges,
W74-04482 8B

SEA-AIR INTERACTION
A Review of Oceanographic Variables and Their Analyses and Predictions Over the Continental Shelf,
W74-04329 2L

SEA ICE
Ice Engineering--Summary of Elastic Properties Research and Introduction to Viscoelastic and Nonlinear Analysis of Saline Ice,
W74-04793 2C

SEA-LAND INTERACTION
A Review of Oceanographic Variables and Their Analyses and Predictions Over the Continental Shelf,
W74-04329 2L

SEA LEVEL
Some Results of Regional Coastal Investigations in the USSR,
W74-04426 2J

History of the Formation of the Coasts of Kara-Bogaz-Gol,
W74-04427 2J

Some Data on the Post-Glacial Transgression of the Bering Sea,
W74-04431 2J

Morphology and Evolution of aLagoon Coast on Sakhalin,
W74-04433 2J

The Atlantic Coast of Long Island,
W74-04626 8A

SEA WATER
Determination of Chromium in Sea Water by Atomic Absorption Spectrometry,
W74-04516 5A

Comments on Veronis' Paper, 'On Properties of Seawater Defined by Temperature, Salinity, and Pressure',
W74-04658 2K

Hydrocarbon and Chlorophyll: A Correlation in the Upwelling Region off West Africa,
W74-04771 5B

Laboratory Studies of the Accommodation of Some Crude and Residual Fuel Oils in Sea Water,
W74-04775 5B

SEALANTS
Laboratory Study of Self-Sealing Limestone Plugs for Mine Openings,
W74-04559 5G

SEASONANCE
Hurricane Storm Surge Considered as a Resonance Phenomenon,
W74-04332 2L

SECALOTRIUM
A Comparative Study of the Size and Receptivity of the Stigma in Wheat, Rye, Triticale and Secalotricum,
W74-04690 3F

SECONDARY PRODUCTIVITY
Measurement of Adenosine Triphosphate (ATP) in Two Precambrian Shield Lakes of Northwestern Ontario,
W74-04782 5B

SEDIMENT CONTROL
Mudflows (Selevyye potoki),
W74-04581 4D

SEDIMENT TRANSPORT
Growth of Longshore Currents Downstream of a Surf-Zone Barrier,
W74-04324 2J

The Relationship Between Wave Action and Beach Profile Characteristics,
W74-04331 2J

Littoral Transport in the Great Lakes,
W74-04334 2J

Wave Effect on the Coast Formation and Erosion,
W74-04335 2J

Theoretical Forms of Shorelines,
W74-04336 2J

Mechanical Bypassing of Littoral Drift at Inlets,
W74-04337 2L

Shores and Shore Processes,

SILTS

Thaw Consolidation of Alaskan Silts and Granular Soils,
W74-04379 2C

SILVER/SULFIDE ELECTRODES

Use of a Silver-Sulfide Electrode for Standardizing Aqueous Sulfide Solution in Determining Sulfide in Water,
W74-04777 5A

SIMULATION ANALYSIS

Evaluation and Simulation of Chemical-Quality Data for Five Montana Sampling Stations,
W74-04484 2K

A Simulation Model for Evaluating Irrigation Management Practices,
W74-04564 3F

The Use of Computer Simulations for Systems Ecological Studies in the Baltic,
W74-04634 5B

The Application of Numerical Simulation Models in the Assessment of the Effect of Discharges into Coastal Waters,
W74-04674 5B

SKIMMING

Skimmer Trap,
W74-04713 5G

SLIME

Water Reuse and Deposits Control,
W74-04520 5D

SLOPES

The Possibility of Forecasting Transient Coastal Relief Changes by Waves,
W74-04436 2J

The Determination of Maximum Wave Velocities in the Shore Zone of the Sea,
W74-04437 2J

The Effect of Wave Refraction on the Formation of an Equilibrium Profile of Submarine Coastal Slope,
W74-04438 2J

Spring Runoff From Hillslopes, Small Watersheds, and River Basins (Vesenniy stok so sklonov, malykh vodosborov, rechnykh basseynov),
W74-04577 2E

Slope Development on a Mississippi River Bluff in Historic Time,
W74-04585 2J

High-Angle Beach Stratification, Sapelo Island, Georgia,
W74-04738 2J

Waves and Tides Near the Shore,
W74-04758 2L

SLUDGE DISPOSAL
Paper Mill Sludge Disposal on Soils: Effects on the Yield and Mineral Nutrition of Oats (Avena satival.),
W74-04519 5E

SLUDGE TREATMENT
Gravity Dewatering: Application to Paper Mill Wastes,
W74-04533 5D

Trickling Filter-Activated Sludge Combinations for Domestic Wastewater Treatment,
W74-04798 5D

SMALL WATERSHEDS
Spring Runoff From Hillslopes, Small Watersheds, and River Basins (Vesenniy stok so sklonov, malykh vodosborov, rechnykh basseynov),
W74-04577 2E

Hydrologic Data for Small Rural Catchments in Australia, 1973,
W74-04842 2E

SNAILS
Ecological Investigations of Ponds with Special Regard to the Consequences of Water Pollution by Oil, (In German),
W74-04635 5C

SNAKE RIVER (IDA)
Suspended and Bedload Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W74-04846 2J

SNOW
Polluted Snow in Southern Norway During the Winters 1968-1971,
W74-04652 5B

SNOW ACCUMULATION
Accumulation on the Devon Island Ice Cap, Northwest Territories, Canada,
W74-04325 2C

SNOW COVER
Indirect Mapping of the Snowcover for Permafrost Prediction at Schefferville, Quebec,
W74-04356 2C

Permafrost and Snowcover Relationships Near Schefferville,
W74-04362 2C

Studies at the Timmins 4 Permafrost Experimental Site,
W74-04363 2C

SNOWMELT
Effects of Stratigraphic Layers on Water Flow Through Snow,
W74-04572 2C

SNOWPACKS
Effects of Stratigraphic Layers on Water Flow Through Snow,
W74-04572 2C

Water Flow Through Snow Overlying an Impermeable Boundary,
W74-04803 2C

SOCIAL ADJUSTMENT
A Detailed Investigation of the Sociological, Economic, and Ecological Aspects of Proposed Reservoir Sites in the Salt River Basin of Kentucky,
W74-04310 2A

SOCIAL ASPECTS
Social, Economic, Environmental, and Technical Factors Influencing Water Reuse,
W74-04317 5D

SOCIAL CHANGE
Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

SOCIAL IMPACT
Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

SOCIAL VALUES
What Do We Mean by Metropolitan Water Management Institutions.,
W74-04498 6E

SOCKEYE SALMON
Bioassay Procedures to Evaluate Acute Toxicity of Neutralized Bleached Kraft Pulp Mill Effluent to Pacific Salmon,
W74-04779 5C

SODIUM COOLING
Breeder Reactors: Power for the Future,
W74-04656 8C

SOFT BEACH SAND
Development and Geologic Significance of Soft Beach Sand,
W74-04757 2J

SOIL ANALYSIS
Spectrophotometric Estimation of Arsenic in Nitric Acid Extracts of Soil and Soil Additives,
W74-04769 5A

SOIL CHEMICAL PROPERTIES
One-Dimensional Model of the Movement of Trace Radioactive Solute Through Soil Columns: The Percol Model,
W74-04444 5B

SOIL CONTAMINATION
One-Dimensional Model of the Movement of Trace Radioactive Solute Through Soil Columns: The Percol Model,
W74-04444 5B

Strontium-90 and Cesium-137 Levels in Soils of Various Types at Niigata Prefecture, Japan,
W74-04453 5B

A Radiological Environmental Survey at EBR-II,
W74-04455 5B

SOIL DENSITY
Influences of Soil Density, Clay Silt and Humus Content on Measurements of Soil Water by Neutron Gauges, (In German),
W74-04556 2G

SOIL DISPOSAL FIELDS
Land Disposal of Waste Gases: 1. Flow Analysis of Gas Injection Systems,
W74-04479 5E

Land Disposal of Waste Gases: II. Gas Flow from Buried Pipes,
W74-04480 5E

Paper Mill Sludge Disposal on Soils: Effects on the Yield and Mineral Nutrition of Oats (Avena satival.),
W74-04519 5E

Mill's Waste Water Used for Spray Irrigation.
W74-04543 5D

SOIL FORMATION
Soil Development and Patterned Ground Evolution in Beacon Valley Antarctica,
W74-04372 2G

SOIL MECHANICS
Mechanical Properties of Frozen Ground Under High Pressure,
W74-04375 2C

SOIL MOISTURE
The Unfrozen Water and the Apparent Specific Heat Capacity of Frozen Soils,
W74-04374 2C

Soil Crusting Related to Sprinkler Intensity,
W74-04560 3F

A Simulation Model for Evaluating Irrigation Management Practices,
W74-04564 3F

Determination of Soil Moisture by Remote Sensing Techniques (Opredeleniye vlazhnosti pochvy distantsionnymi aerokosmicheskimi metodami),
W74-04576 2G

Influence of Soil Moisture Conditions on Growth and Development of the Potato Solanum tuberosum L.,
W74-04687 3F

Potential Intensity of Photosynthesis in Some Tomato and Beet Species Under Different Soil Moisture, (In Russian),
W74-04691 3F

Water Regime in Alluvial Fan Soils of the Araks River, (In Russian),
W74-04733 2G

Water Conditions in Soils of the Bogar Zone of the Uzbek SSR,
W74-04809 2G

Nutrient Uptake by Winter Wheat in a Zone of Unstable Moisture, (In Russian),
W74-04827 3F

SOIL MOISTURE DEPLETION
Influence of Environmental Moisture Conditions on the Phenol Compound Amount in Calluna Vulgaris L.,
W74-04487 2I

SOIL PHYSICAL PROPERTIES
Shock-Wave Studies of Ice and Two Frozen Soils,
W74-04378 2C

Sound and Shock Transmission in Frozen Soils,
W74-04383 2C

SOIL STRENGTH
Viscoelastic Properties of Frozen Soil Under Vibratory Loads,
W74-04388 8D

Shear Strength at a Thaw Interface,
W74-04390 2C

SOIL TESTS
Triaxial and Creep Tests on Frozen Ottawa Sand,
W74-04386 2C

Sample Disturbance and Thaw Consolidation of a Deep Sand Permafrost,
W74-04387 2C

SOIL TYPES
Role of Soil Conditions in the Development of Moths, (In Russian),
W74-04640 3F

SOIL WATER
Effect of Porosity on Amount of Soil Water Transferred in a Freezing Silt,
W74-04376 2C

Influences of Soil Density, Clay Silt and Humus Content on Measurements of Soil Water by Neutron Gauges, (In German),
W74-04556 2G

SOIL WATER MOVEMENT
Phosphorus Relationships in Runoff from Fertilized Soils,
W74-04471 5B

Measurement of Moisture Diffusivity of Wet Swelling Systems,
W74-04493 2G

SOIL-WATER-PLANT RELATIONSHIPS
Plant Responses to Water Stress,
W74-04539 2I

SOIL WATER POTENTIAL
Relations Between Soil Water Potential and Disease in Wheat Seedlings Infected by Puccinia recondita,
W74-04653 3F

SOILS
Micro- and Mesobenthos Development as a Factor of Soil Composition (In Russian),
W74-04816 2H

SOLAR DISTILLATION
Solar Energy for the Concentration of Pulp Mill Effluents,
W74-04544 5D

Solar Distillation Apparatus,
W74-04720 3A

SOLAR RADIATION
Solar Energy for the Concentration of Pulp Mill Effluents,
W74-04544 5D

SOLID WASTES
A History and Preliminary Inventory Report on the Kentucky Radioactive Waste Disposal Site,
W74-04442 5B

Hydrologic and Geologic Considerations for Solid-Waste Disposal in West-Central Florida,
W74-04605 5E

SOLIFLUCTION
Rates of Mass Wasting in the Ruby Range, Yukon Territory,
W74-04371 2J

SOLITARY WAVES
The Solitary Wave,
W74-04326 8B

The Effects of Bottom Configuration on the Deformation, Breaking and Run-Up of Solitary Waves,
W74-04613 2E

Propagation of a Finite-Amplitude Surface Wave With Allowance for Random Irregularities of the Bottom,
W74-04841 2J

SOUND WAVES
Sound and Shock Transmission in Frozen Soils,
W74-04383 2C

SOUNDING
Radio Depth-Sounding on Meighen and Barnes Ice Caps, Arctic Canada,
W74-04571 2C

SOUNDS
Studies of a Southern Fiord.
W74-04727 2J

SOUTHEAST U
Development and Geologic Significance of Soft Beach Sand,
W74-04757 2J

SOUTHWEST U
Southwestern Groundwater Law: A Textual and Bibliographic Interpretation,
W74-04460 4B

SPAS
Some Problems Involved in Optimal Protection of the Environment in Spas,
W74-04847 5G

SPAWNING
Sex Cycle, Spawning and Fertility of West Siberian Crucians in the Steppe Lakes, (In Russian),
W74-04689 2H

SPECIFIC CONDUCTIVITY
Lakes in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W74-04496 2H

SPECTROPHOTOMETRY
Analytical Techniques for the Determination of Petroleum Contamination in Marine Organisms,
W74-04594 5A

Spectrophotometric Estimation of Arsenic in Nitric Acid Extracts of Soil and Soil Additives,
W74-04769 5A

SPECTROSCOPY
Determination of Chromium in Sea Water by Atomic Absorption Spectrometry,
W74-04516 5A

SPRAY IRRIGATION
Survey of Facilities Using Land Application of Wastewater,
W74-04677 5D

The Effect of Water Spraying on the Rein-Forcement of Physiological Process in Cotton Plants,
W74-04823 3F

SPRINKLER IRRIGATION
Soil Crusting Related to Sprinkler Intensity,
W74-04560 3F

Water Consumption and Biological Coefficient of Furrow and Sprinkler Irrigated Cotton, (In Bulgarian),
W74-04824 3F

SPRINKLING
Soil Crusting Related to Sprinkler Intensity,
W74-04560 3F

ST
Summary Report of Metromex Studies, 1971-1972.
W74-04509 2B

STABILITY
On the Stability of Laminar Plumes: Some Numerical Solutions and Experiments,
W74-04662 5B

STANDING WAVES
A Study on Mass Transport in Boundary Layers in Standing Waves,
W74-04615 2J

STARCH DERIVATIVES
Mercury Removal from Waste Water with Starch Xanthate-Cationic Polymer Complex,
W74-04541 5D

STATE GOVERNMENTS
State Environmental Management, Case Studies of Nine States,
W74-04503 5G

State Standards for Temperature, (Issued by the Environmental Protection Agency in August 1972).
W74-04669 5G

STATE JURISDICTION
State Environmental Management, Case Studies of Nine States,
W74-04503 5G

STATISTICAL MODELS
Multi-Dimensional Aspects of Eddy Diffusion Determined by Dye Diffusion Experiments in Coastal Waters (Summary),
W74-04322 2L

Statistical Analysis of Hydrograph Characteristics for Small Urban Watersheds,
W74-04459 2A

STIGMA
A Comparative Study of the Size and Receptivity of the Stigma in Wheat, Rye, Triticale and Secalotricum,
W74-04690 3F

STOCHASTIC PROCESSES
The Operation of a Stream-Aquifer System Under Stochastic Demands,
W74-04808 4B

STOMATA
Changes in Enzymes in the Plant as Related to Water Supply and Usage,
W74-04306 2I

STORAGE
Approaches to Stormwater Management,
W74-04458 5A

STORAGE REQUIREMENTS
Mathematical Modeling of Stream Storage Potential,
W74-04305 2E

STORM RUNOFF
Management of Stormwater Runoff in Suburban Environments,
W74-04302 5D

Approaches to Stormwater Management,
W74-04458 5A

Hypochlorination of Polluted Storm-Water Pumpage at New Orleans,
W74-04676 5D

STORM SURGE
Hurricane Storm Surge Considered as a Resonance Phenomenon,
W74-04332 2L

Hurricane Tide Prediction for New York Bay,
W74-04343 2L

Numerical Computations of Storm Surges with Bottom Stress,
W74-04759 2L

STORMS
The Atlantic Coast of Long Island,
W74-04626 8A

Field Measurements of Swell Off the Island of Aruba,
W74-04723 2E

STORMWATER MANAGEMENT
Approaches to Stormwater Management,
W74-04458 5A

STRATIFICATION
Estuaries,
W74-04321 2L

New Dimensions in Estuary Classification,
W74-04735 2L

High-Angle Beach Stratification, Sapelo Island, Georgia,
W74-04738 2J

STRATIGRAPHY
Geochemistry of Permafrost and Quaternary Stratigraphy,
W74-04364 2C

Stratigraphy and Diagenesis of Perennially Frozen Sediments in the Barrow, Alaska, Region,
W74-04365 2C

STREAM IMPROVEMENT
Willamette Cleanup,
W74-04522 5D

STREAMFLOW
Hydrology of the Central Arctic River Basins of Alaska,
W74-04304 2A

A Laboratory Investigation of Free Surface Flows Over Wavy Beds,
W74-04477 8B

Surface-Water Availability, Lauderdale County, Alabama,
W74-04494 2E

Characteristics of Streamflow at Gaging Stations in the Loup River Basin, Nebraska,
W74-04794 2E

STRENGTH OF MATERIALS
Mechanical Properties of Rocks at Low Temperatures,
W74-04380 2C

STRIATED GROUND
Striated Ground, A Type of Patterned Ground in the Periglacial Area of the Venezuelan Andes, (In Spanish),
W74-04651 2G

STRONTIUM
Strontium-90 and Cesium-137 Levels in Soils of Various Types at Niigata Prefecture, Japan,
W74-04453 5B

SUBARCTIC REGIONS
The Water Balance in Arctic and Subarctic Regions--Annotated Bibliography and Preliminary Assessment,
W74-04601 2C

SUBGLACIAL DEVELOPMENT
Subglacial Development of Chlorella in Baikal, (In Russian),
W74-04647 2H

SUBMARINE SAND RIDGES
Submarine Sand Ridges as Indicators of Longshore Migration of Sediments,
W74-04434 2J

SUBSIDENCE
Thaw Consolidation of Alaskan Silts and Granular Soils,
W74-04379 2C

Practical Extensions to a Theory of Consolidation for Thawing Soils,
W74-04384 2C

Some Passive Methods of Controlling Geocryological Conditions in Roadway Construction,
W74-04406 2C

Environmental Considerations for the Utilization of Permafrost Terrain,
W74-04407 2C

Settlement Associated with the Thawing of Permafrost,
W74-04408 2C

Control of Permafrost Degradation Beneath a Roadway by Subgrade Insulation,
W74-04409 4C

Long-Term Effects of Vegetative Cover on Permafrost Stability in an Area of Discontinuous Permafrost,
W74-04417 4C

Effects of Ground-Ice Variability and Resulting Thaw Settlements on Buried Warm-Oil Pipelines,
W74-04422 4C

Performance of a Warm-Oil Pipeline Buried in Permafrost,
W74-04423 8D

SUBSURFACE FLOW
Studies on the Validity of Darcy's Law for Flow in Natural Sands,
W74-04307 2F

SUBSURFACE INVESTIGATIONS
Groundwater Investigation and Management in Iran,
W74-04569 7B

SUBURBAN WATERSHEDS
Management of Stormwater Runoff in Suburban Environments,
W74-04302 5D

SUCCESSION (PLANTS)
Observations on the Vegetation of the Koronowo Reservoir,
W74-04654 2I

SUCROSE
Heterotrophic Utilization of Sucrose in an Artificially Enriched Lake,
W74-04781 5C

SULFATES
Color Removal from Textile Dye Waste by Coagulation,
W74-04303 5D

Effects of Toxicants on Brackish-Water Phytoplankton Assimilation,
W74-04644 5C

SULFIDES
Use of a Silver-Sulfide Electrode for Standardizing Aqueous Sulfide Solution in Determining Sulfide in Water,
W74-04777 5A

SULFUR
Polluted Snow in Southern Norway During the Winters 1968-1971,
W74-04652 5B

Analysis of Trace Elements, Phosphorus and Sulphur, in the Lipid and the Non-Lipid Phase of Halibut (Hippoglossus hippoglossus) and Tunny (Thunnus thynnus),
W74-04770 5A

SULFUR COMPOUNDS
Hydrogen Peroxide for Industrial Pollution Control,
W74-04532 5D

SURF
SURF,
W74-04725 2J

Inshore Sea Surface Temperature and Salinity Conditions at Agate Beach, Yaquina Bay and Whale Cove, Oregon, in 1970,
W74-04730 2L

SURF ZONE
A Field Investigation of Sand Transport in the Surf Zone,
W74-04619 2J

SURFACE-GROUNDWATER RELATIONSHIPS
Effects of Permafrost on Stream Flow Characteristics in the Discontinuous Permafrost Zone of Central Alaska,
W74-04392 2C

Groundwater Pore Pressures Adjacent to Subarctic Streams,
W74-04393 2C

Recharge of a Central Alaska Lake by Subpermafrost Groundwater,
W74-04394 2F

A Design Procedure for the Conjunctive Use of Surface and Groundwater Storages,
W74-04598 4B

Surface- and Ground-Water Conditions During 1959-61 in a Part of Flett Creek Basin, Tacoma, Washington,
W74-04796 2E

The Operation of a Stream-Aquifer System Under Stochastic Demands,
W74-04808 4B

SURFACE WATERS
Surface-Water Availability, Lauderdale County, Alabama,
W74-04494 2E

Principles of Evaluating Effects of Thermal Discharges on Surface Waters (Grundlagen fur die Beurteilung der Warmebelastungen von Gewassern).
W74-04764 5C

SURGES
Hurricane Storm Surge Considered as a Resonance Phenomenon,
W74-04332 2L

Feasibility Study for a Surge-Action Model of Monterey Harbor, California,
W74-04721 2L

SURVEILLANCE PROGRAM
Environmental Surveillance for Fuel Fabrication Plants,
W74-04451 5B

SURVEYS
A Geoecological Terrain Analysis of Discontinuously Frozen Ground in the Upper Mackenzie River Valley, Canada,
W74-04354 2C

Aerial Radiological Measuring Survey of the Area Surrounding the Vermont Yankee Generating Station and the Yankee Nuclear Power Station, September 18, 1970.
W74-04448 5A

Radiological Status of the Groundwater Beneath the Hanford Project, July-December 1972,
W74-04452 5B

A Radiological Environmental Survey at EBR-II,
W74-04455 5B

Water Resources Applications,
W74-04584 7B

SUSPENDED SOLIDS
Method of Treating Sewage Using High Polymer Ratio Flocculation Agent Biologically Produced in Situ,
W74-04717 5D

Nucleonic Sediment Concentration Gauge - Comparison of Transmission and Scattering Modes,
W74-04774 2J

SWAMPS
Observations on the Vegetation of the Koronowo Reservoir,
W74-04654 2I

SWARDS
Effect of Long-Term Application of Variously High Rates of Nutrients on Natural Grassland Swards,
W74-04693 4A

SWASH
Sea Waves and Beach Cusps,
W74-04734 2J

SWASH ZONE
Wave Period and the Swash Zone Energy Balance,
W74-04622 2J

SWEDEN (SKAGERSHULTAMOSSEN)
Bog Vegetation Re-Mapped after Sixty Years: Studies on Skagershultamossen, Central Sweden,
W74-04683 2I

SWELL
Field Measurements of Swell Off the Island of Aruba,
W74-04723 2E

SYNTHETIC HYDROGRAPHS
Statistical Analysis of Hydrograph Characteristics for Small Urban Watersheds,
W74-04459 2A

SYSTEMS ANALYSIS
Linear Systems Technique Applied to Hydrologic Data Analysis and Instrument Evaluation: A Case Study on Data from the Alice Springs Area,
W74-04470 2A

Allocation of Funding for Wastewater Treatment Facilities,
W74-04562 5D

TAIGA (ALASKA)
Ecological Effects of River Flooding and Forest Fires on Permafrost in the Taiga of Alaska,
W74-04352 2C

TAPE RECORDERS
An Inexpensive S.T.D. Data Logging System,
W74-04772 7C

TAXES
Sociocultural Impact of Reservoirs on Local Government Institutions, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures--Phase 4,
W74-04311 6B

TEMPERATURE
Thermal Conditions in Permafrost--A Review of North American Literature,
W74-04347 2C

Influence of Climatic and Terrain Factors on Ground Temperatures at Three Locations in the Permafrost Region of Canada,
W74-04348 2C

Deep Temperature Observations in the Canadian North,
W74-04349 2C

Comments on Veronis' Paper, 'On Properties of Seawater Defined by Temperature, Salinity, and Pressure',
W74-04658 2K

Temperature Acclimation in the Medusa, Chrysaora quinquecirrha,
W74-04660 5C

Thermal Responses in Cirrhina mrigala Fry,
W74-04661 5C

Effects of Temperature on Developing Meristic Structures of Smallmouth Bass, Micropterus dolomieui Lacepede,
W74-04663 5C

Temperature Requirements for Embryos and Larvae of the Northern Pike, Esox lucius (Linnaeus),
W74-04670 5C

Spectra of the Temperature and Humidity Fluctuations and of the Fluxes of Moisture and Sensible Heat in the Marine Boundary Layer,
W74-04672 2E

Comments on Johnson's Paper, 'On the Wind-Driven Circulation of a Stratified Ocean',
W74-04675 2E

Inshore Sea Surface Temperature and Salinity Conditions at Agate Beach, Yaquina Bay and Whale Cove, Oregon, in 1970,
W74-04730 2L

Horizontal Distribution of Some Chemical and Physical Characteristics in Lipno Reservoir,
W74-04814 5C

TENNESSEE
Remote Sensing in Sampling Site Location in Lakes and Streams,
W74-04313 5A

Annual Consumption of Cesium-137 and Cobalt-60 Labeled Pine Seeds by Small Mammals in an Oak-Hickory Forest,
W74-04450 5B

TERRAIN
Influence of Climatic and Terrain Factors on Ground Temperatures at Three Locations in the Permafrost Region of Canada,
W74-04348 2C

TERRAIN ANALYSIS
A Geoecological Terrain Analysis of Discontinuously Frozen Ground in the Upper Mackenzie River Valley, Canada,
W74-04354 2C

TEXAS
Optimal Operation of Multi-Reservoir Water Resources Systems,
W74-04314 4A

Quantity and Chemical Quality of Low Flow in the East Fork San Jacinto and West Fork San Jacinto Rivers near Houston, Texas, June 24, 26, 1969,
W74-04481 5B

Effects of Urbanization on Floods in the Dallas, Texas, Metropolitan Area,
W74-04483 4C

Galveston Bay Hurricane Surge Study: Report 2. Effects of Proposed Barriers on Tides, Currents, Salinities, and Dye Dispersion for Normal Tide Conditions--Appendix B: Calibration tests,
W74-04573 8B

Tenth Year Annual Report, Center for Research in Water Resources, University of Texas at Austin.
W74-04595 9A

Ground-Water Data for Harris County, Texas: Volume I. Drillers' Logs of Wells, 1905-71.
W74-04602 4B

Water Quality Records for the Hubbard Creek Watershed, Texas, October 1969-September 1972,
W74-04606 5B

TEXTILE DYE WASTES
Color Removal from Textile Dye Waste by Coagulation,
W74-04303 5D

THAWING
Thermal Disturbance Due to Channel Shifting, Mackenzie Delta, N.W.T., Canada,
W74-04351 2C

Ecological Effects of River Flooding and Forest Fires on Permafrost in the Taiga of Alaska,
W74-04352 2C

Physics, Chemistry, and Mechanics of Frozen Ground: A Review,
W74-04373 2C

The Unfrozen Water and the Apparent Specific Heat Capacity of Frozen Soils,
W74-04374 2C

Effect of Porosity on Amount of Soil Water Transferred in a Freezing Silt,
W74-04376 2C

Thaw Consolidation of Alaskan Silts and Granular Soils,
W74-04379 2C

Practical Extensions to a Theory of Consolidation for Thawing Soils,
W74-04384 2C

Sample Disturbance and Thaw Consolidation of a Deep Sand Permafrost,
W74-04387 2C

Shear Strength at a Thaw Interface,
W74-04390 2C

Settlement Associated with the Thawing of Permafrost,
W74-04408 2C

Some Effects of Surface Disturbance on the Permafrost Active Layer at Inuvik, N.W.T., Canada,
W74-04413 4C

Permafrost Protection for Pipelines,
W74-04415 2C

Long-Term Effects of Vegetative Cover on Permafrost Stability in an Area of Discontinuous Permafrost,
W74-04417 4C

Performance of a Warm-Oil Pipeline Buried in Permafrost,
W74-04423 8D

THEORETICAL ANALYSIS
Spectra of the Temperature and Humidity Fluctuations and of the Fluxes of Moisture and Sensible Heat in the Marine Boundary Layer,
W74-04672 2E

THERMAL DISCHARGES
Heat - A Growing Water Pollution Problem,
W74-04668 5B

THERMAL INVERSION
The Thermal Regime of Lake Lanao (Philippines) and its Theoretical Implications for Tropical Lakes,

Heat - A Growing Water Pollution Problem,
W74-04668 5B

THERMAL PREFERENCE
The Preferred Temperature of Fish and Their Midsummer Distribution in Temperate Lakes and Streams,
W74-04666 5C

THERMAL STRATIFICATION
The Thermal Regime of Lake Lanao (Philippines) and its Theoretical Implications for Tropical Lakes,
W74-04665 2H

Verification of Water Temperature Forecasts for Deep, Stratified Reservoirs,
W74-04807 4A

THERMAL STRESS
Thermal Responses in Cirrhina mrigala Fry,
W74-04661 5C

THERMAL WATER
Ground Water and the Geothermal Resource.
W74-04586 4B

THERMOCAPILLARY FLOWS
Convective Heat Transfer to Water Containing Bubbles: Enhancement not Dependent on Thermocapillarity,
W74-04664 8B

THERMODYNAMIC BEHAVIOR
Viscosity Measurements of Water in Region of Its Maximum Density,
W74-04518 2K

Analytical Methods of Solution of Conjugated Problems in Convective Heat Transfer,
W74-04667 8B

THERMOKARST
Thermokarst Development, Banks Island, Western Canadian Arctic,
W74-04368 2C

THERMOPHILIC ANIMALS
Concerning Large-Scale Cultivation of Thermophilic Cosmopolitan Mastigocladus Laminousus Cohn (Cyanophyta) in Icelandic Hot Springs,
W74-04486 2I

THREE DIMENSIONAL FLOW
A Three-Dimensional Model for Estuaries and Coastal Seas: Volume I, Principles of Computation,
W74-04301 2L

TIDAL CURRENTS
Quantitative Tracing of Littoral Drift,
W74-04617 2J

Littoral Drift as Function of Waves and Current,
W74-04623 2J

Hydraulic Model Experiment on the Duffusion Due to the Coastal Current,
W74-04628 5B

TIDAL CYCLE
Shear Velocity in a Tidal Estuary,
W74-04629 2L

TIDAL EFFECTS
Wave Effect on the Coast Formation and Erosion,
W74-04335 2J

Estuarine Currents and Tidal Streams,
W74-04344 2L

Variable Dispersion and Its Effects on the Movements of Tracers on Beaches,
W74-04618 2J

Shear Velocity in a Tidal Estuary,
W74-04629 2L

Use of a Computational Model for Two-Dimensional Tidal Flow,
W74-04631 2L

Some Characteristics of the Dutch Coast,
W74-04754 2J

Drastic Beach Changes in a Low-Energy Environment Caused by Hurricane Betsy,
W74-04756 2J

Phenomena Affecting Improvement of the Lower Columbia Estuary and Entrance,
W74-04763 2L

TIDAL STREAMS
Estuarine Currents and Tidal Streams,
W74-04344 2L

TIDEAL MUD FLATS
Changes in the Avifauna of the Biesbosch in the 1st Yr After the Elimination of the Tide,
W74-04699 2I

TIDES
The Response to Tidal Fluctuations of a Leaky Aquifer System,
W74-04308 2F

Hurricane Tide Prediction for New York Bay,
W74-04343 2L

The Possibility of Forecasting Transient Coastal Relief Changes by Waves,
W74-04436 2J

Selected Bibliography on Beach Features and Related Nearshore Processes.
W74-04728 2J

An Annotated Bibliography of Flushing and Dispersion in Tidal Waters,
W74-04731 2L

Waves and Tides Near the Shore,
W74-04758 2L

TIME SERIES ANALYSIS
Special Analysis of Short Inertial-Internal Wave Records,
W74-04489 2E

Detailed Time Variations in Mean Temperature and Heat Content of Some Madison Lakes,
W74-04659 2H

TISZA RIVER
Water Problems of the Tisza River in Hungary and Cooperation Among Tisza Basin Countries in the Field of Water Management (Vodnyye problemy reki Tisy v Vengrii i sotrudnichestvo stran basseyna Tisy v oblasti vodnogo khozvayst va),
W74-04574 4A

TNT
A Proposal for the Investigation of Possible Ground-Water Contamination in the Bangor Area, Kitsap County, Washington,
W74-04491 5B

TOBACCO
Results of Trials with Tobacco and Cotton Rotations Under Irrigation, (In Bulgarian),
W74-04825 3F

TOMATO
Potential Intensity of Photosynthesis in Some Tomato and Beet Species Under Different Soil Moisture, (In Russian),
W74-04691 3F

TOPOGRAPHY
Topology of River Systems and Hydrographic Indicator Studies (Topologiya rechnykh sistem i gidrograficheskiye indikatsionnyye issledovaniya),
W74-04578 2A

TOXICITY
Effects of Condensates on the Toxicity of Kraft Pulp Mill Effluents,
W74-04521 5D

Apparatus for Recording Avoidance Movements of Fish,
W74-04776 5A

Bioassay Procedures to Evaluate Acute Toxicity of Neutralized Bleached Kraft Pulp Mill Effluent to Pacific Salmon,
W74-04779 5C

TRACE ELEMENTS
Analysis of Trace Elements, Phosphorus and Sulphur, in the Lipid and the Non-Lipid Phase of Halibut (Hippoglossus hippoglossus) and Tunny (Thunnus thynnus),
W74-04770 5A

TRACERS
Variable Dispersion and Its Effects on the Movements of Tracers on Beaches,
W74-04618 2J

Laboratory Applications of Radioisotopic Tracers to Follow Beach Sediments,
W74-04751 2J

A Study of Critical Depth and Mode of Sand Movement Using Radioactive Glass Sand,
W74-04752 2J

Tracing Coastal Sediment Movement by Naturally Radioactive Minerals,
W74-04753 2J

TRAINING
Tenth Year Annual Report, Center for Research in Water Resources, University of Texas at Austin.
W74-04595 9A

TRANSPARENCY
Horizontal Distribution of Some Chemical and Physical Characteristics in Lipno Reservoir,
W74-04814 5C

TRANSPIRATION
The Effect of Water Spraying on the Reinforcement of Physiological Process in Cotton Plants,
W74-04823 3F

TREATMENT FACILITIES
Mechanical Clarification of Industrial Waste Waters (Mechanische Klaerung von Industrieabwaessern).
W74-04515 5D

Modern Waste Water Treatment and Processing Techniques in the Paper and Board Industry (Moderne Abwasseraufbereitungs-und Verfahrenstechnik in der Papier- und Kartonindustrie),
W74-04517 5D

A New Secondary Treatment.
W74-04524 5D

Study of Pulp and Paper Industry's Effluent Treatment.
W74-04538 5D

Allocation of Funding for Wastewater Treatment Facilities,
W74-04562 5D

Hypochlorination of Polluted Storm-Water Pumpage at New Orleans,
W74-04676 5D

Survey of Facilities Using Land Application of Wastewater,
W74-04677 5D

TRICKLING FILTERS
Trickling Filter-Activated Sludge Combinations for Domestic Wastewater Treatment,
W74-04798 5D

TRITICALE
A Comparative Study of the Size and Receptivity of the Stigma in Wheat, Rye, Triticale and Secalotricum,
W74-04690 3F

TRITIUM
Radiological Status of the Groundwater Beneath the Hanford Project, July-December 1972,
W74-04452 5B

TSUNAMIS
Hurricane Storm Surge Considered as a Resonance Phenomenon,
W74-04332 2L

TUNNY
Analysis of Trace Elements, Phosphorus and Sulphur, in the Lipid and the Non-Lipid Phase of Halibut (Hippoglossus hippoglossus) and Tunny (Thunnus thynnus),
W74-04770 5A

TURBULENCE
Simulation of Horizontal Turbulent Diffusion of Particles Under Waves,
W74-04624 2J

Modeling of Turbulent Transport in the Surface Layer,
W74-04795 2D

TURBULENT BOUNDARY LAYERS
Spectra of the Temperature and Humidity Fluctuations and of the Fluxes of Moisture and Sensible Heat in the Marine Boundary Layer,
W74-04672 2E

Measurements of the Turbulent Fluxes of Momentum, Moisture and Sensible Heat Over the Ocean,
W74-04673 2E

TURKEY
Possible Application of Remote Sensing for Underground Water Exploration in Turkey,
W74-04568 7B

UNIT HYDROGRAPHS
Statistical Analysis of Hydrograph Characteristics for Small Urban Watersheds,
W74-04459 2A

UNITED KINGDOM (ENGLAND)
Sea Waves and Beach Cusps,
W74-04734 2J

UNITED STATES
Environmental Monitoring and Disposal of Radioactive Wastes from U.S. Naval Nuclear-Powered Ships and Their Support Facilities, 1972,
W74-04441 5B

What's Wrong with Government Water Control Programs and how They can be Improved,
W74-04632 5D

UNIVERSITIES
Tenth Year Annual Report, Center for Research in Water Resources, University of Texas at Austin.
W74-04595 9A

UNSATURATED FLOW
On Solving the Unsaturated Flow Equation: 2. Critique of Parlange's Method.
W74-04492 2G

Effects of Stratigraphic Layers on Water Flow Through Snow,
W74-04572 2C

Water Flow Through Snow Overlying an Impermeable Boundary,
W74-04803 2C

URBAN HYDROLOGY
Effects of Urbanization on Floods in the Dallas, Texas, Metropolitan Area,
W74-04483 4C

Summary Report of Metromex Studies, 1971-1972.
W74-04509 2B

Hydrologic Investigation and Design in Urban Areas--A Review,
W74-04597 2A

URBAN RUNOFF
Management of Stormwater Runoff in Suburban Environments,
W74-04302 5D

Effects of Urbanization on Floods in the Dallas, Texas, Metropolitan Area,
W74-04483 4C

URBAN WATER SUPPLY
Community Water Supply.
W74-04510 4B

URBAN WATERSHEDS
Statistical Analysis of Hydrograph Characteristics for Small Urban Watersheds,
W74-04459 2A

URBANIZATION
Multipurpose Reservoirs and Urban Development,
W74-04319 6B

Housing and Planning References.
W74-04511 3D

Urbanization: A Hydrological Headache,
W74-04642 4C

UREDOSPORE INFECTION
Relations Between Soil Water Potential and Disease in Wheat Seedlings Infected by Puccinia recondita,
W74-04653 3F

USSR
Some Results of Regional Coastal Investigations in the USSR,
W74-04426 2J

Water Level Fluctuations of the Caspian Sea (K probleme urovennogo rezhima Kaspiyskogo morya),
W74-04575 2H

Spring Runoff From Hillslopes, Small Watersheds, and River Basins (Vesenniy stok so sklonov, malykh vodosborov, rechnykh basseynov),

Topology of River Systems and Hydrographic Indicator Studies (Topologiya rechnykh sistem i gidrograficheskiye indikatsionnyye issledovaniya),
W74-04578 2A

Some Neglected Sources of Water Pollution (Nedostatochno uchityvayemyye istochniki zagryazneniya prirodnykh vod),
W74-04579 5B

Mudflows (Selevyye potoki),
W74-04581 4D

Water Quality Improvement in River Basins (Experience of Industrialized Countires) (O povyshenii kachestva vody v rechnykh basseynakh (Opyt industrial'nykh stran)),
W74-04583 5G

Subglacial Development of Chlorella in Baikal, (In Russian),
W74-04647 2H

USSR (ADZHAR ASSR)
Vertical Distribution of Zoobenthos of the Mountain River of Adzhar ASSR (In Russian),
W74-04818 2I

USSR (AMUR FLOODPLAINS)
Some New Data Concerning Zizania latifolia (Grisob.) STAPF AND ITS Resources in the Flood Plains of Lower Amur,
W74-04703 2I

USSR (ARAKS RIVER)
Water Regime in Alluvial Fan Soils of the Araks River, (In Russian),
W74-04733 2G

USSR (AZERBAIDZHAN)
Role of Soil Conditions in the Development of Moths, (In Russian),
W74-04640 3F

USSR (AZOV SEA)
Recent Development of the Temryuk Coast on the Azov Sea,
W74-04430 2J

USSR (CASPIAN SEA)
History of the Formation of the Coasts of Kara-Bogaz-Gol,
W74-04427 2J

USSR (CHUSHKA SPIT)
Developmental History and Present-Day Dynamics of the Chushka Spit,
W74-04428 2J

USSR (DNESTR RIVER)
Coastal-Water Vegetation of the Lower Reaches of the Dnestr (In Russian),
W74-04813 2L

USSR (GEORGIA)
Daily Diet and Rate of Feeding of Notothenia rossi marmorata Fischer and Dissostichus eleginoides Smitt, Family Nototheniidae, in the Area of Southern Georgia (USSR), (In Russian),
W74-04679 2I

USSR (IRKUTSK REGION)
Ridge-Pool Complex Formation of Khotkhursky Bog Mass (In Russian),
W74-04812 3F

USSR (KAIRAKKUM RESERVOIR)
The Feeding of Pelecus Cultratus L. in Kairakkum Reservoir, (In Russian),
W74-04695 2H

USSR (KAKHOVKA RESERVOIR)
Micro- and Mesobenthos Development as a Factor of Soil Composition (In Russian),
W74-04816 2H

USSR (KALININ LAKES)
Littoral Vegetation Overgrowing in Some Lakes of Kalinin District, (In Russina),
W74-04646 2H

USSR (KARKINIT BAY)
Some Data on the Post-Glacial Evolution of Karkinit Bay and the Accumulation of Bottom Sediments Within it,
W74-04429 2J

USSR (LAKE BAIKAL)
Ratio of Organic Carbon with Different Types of Oxidizability in the Open Water of Baikal (In Russian),
W74-04819 5C

USSR (OSETIAN ASSR-KIROV REGION)
Effect of Fertilizers and Irrigation Conditions on Yield, Chemical Composition, Baking Qualities of Winter Wheat Grain of Bezostaya 1 Cultivar, (In Russian),
W74-04830 3F

USSR (SAKHALIN ISLAND)
Morphology and Evolution of aLagoon Coast on Sakhalin,
W74-04433 2J

USSR (SEVERSKIY-DONETS RIVER)
Phytoplankton Dynamics in the Severskiy Donets River for the First Years After its Regulation, (In Russina),
W74-04648 5C

USSR (STEPPE LAKES)
Sex Cycle, Spawning and Fertility of West Siberian Crucians in the Steppe Lakes, (In Russian),
W74-04689 2H

USSR (SUKHAN-DARYA BASIN)
Morphology and Life Style of the Turkestan Gudgeon Gobio gobio lepidolaemus Kessler in Waters of the Sukhan-Darya Basin, (In Russian),
W74-04650 8I

USSR (TAIMYR)
The Phytoplankton Productivity in the Pyasina River Near Tareya Village (Western Taimyr), (In Russian),
W74-04698 2I

USSR (TEREK RIVER DELTA)
Feeding of Juvenile Carp Cyprinus carpio L. in the Arakum Bodies of Water (Delta of the Terek River) at Early Developmental Stages, (In Russian),
W74-04649 2L

USSR (UZBEK SSR)
Application of Regression Analysis to Estimation of the Efficiency of Water Use in Irrigation (Opyt primeneniya regressionnogo analiza k otsenke effektivnosti ispol'zovaniya vody pri oroshenii),
W74-04580 3F

Hygienic Efficiency of Measures for Protecting Surface Waters in Uzbek SSR, (In Russian),
W74-04838 5F

USSR (UZBEK SSR-BOGAR ZONE)
Water Conditions in Soils of the Bogar Zone of the Uzbek SSR,
W74-04809 2G

USSR (VOLGA DELTA)
Parasite Fauna of Ctenopharyngodon idella from Pond- and Spawning-Nursery Fisheries in the Volga Delta, (In Russian),
W74-04702 8I

UTAH
A Study of Water Institutions in Utah and Their Influence on the Planning, Developing, and Managing of Water Resources,
W74-04316 6E

UTILITIES
Syracuse Metropolitan Area Comprehensive Plan-Water and Sewer Plan and Services Allocation Plan,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 10
MAY 15, 1974

W74-04851 -- W74-05400

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 10
MAY 15, 1974

W74-04851 -- W74-05400

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

CLUSTERING IN SUPERCOOLED WATER,
Cryobiology Research Inst., Madison, Wis.
D. H. Rasmussen, and A. P. MacKenzie.
Journal of Chemical Physics, Vol 59, No 9, p 5003-5013, Nov. 1, 1973. 10 fig, 1 tab, 29 ref.

Descriptors: *Supercooling, *Water properties, *Water structure, *Specific heat, *Density, *Heavy water, Theoretical analysis, Cooling, Temperature, Thermal capacity, Thermal properties, Molecular structure, Physical properties, Physicochemical properties, Deuterium.

The specific heats and densities of supercooled water and heavy water have been measured from the respective melting points to the respective homogeneous nucleation temperatures. The calorimetric measurements indicate structural contributions to the differences between the specific heats of the liquids and the corresponding crystals. These 'structural specific heats' are exponential functions of the supercooling. The results are interpreted in terms of Frenkel's heterophase fluctuation theory. It is concluded that, during supercooling, water molecules tend to form icelike clusters incorporating six or more monomers. (Brown-IPC)

THE DEVELOPMENT AND FIELD TESTING OF A BASIN HYDROLOGY SIMULATOR,
Kansas Univ., Lawrence. Dept. of Chemical and Petroleum Engineering.
D. W. Green, E. C. Pogge, R. M. Knapp, B. Schorn, and C. Stanford.
Available from the National Technical Information Service as PB-229 501, $5.75 in paper copy, $1.45 in microfiche. University of Kansas Center for Research, Inc., Lawrence, Completion Report, August 1973. 193 p, 39 fig, 7 tab, 38 ref, 2 append. OWRR C-2039(No 3357) (1). 14-31-0001-3357.

Descriptors: *Computer models, *Groundwater basins, *Streamflow forecasting, *River basins, *Surface-groundwater relationships, Groundwater recharge, Groundwater, Base flow, Aquifers, Routing, Hydrologic budget, Soil water movement, Hydrologic cycle, Model studies, Water resources development, *Simulation analysis, *Kansas, Water management(Applied).
Identifiers: Numerical modeling, Stream-aquifer interaction, Stream basin, Surface-groundwater interactions, Basin evapotranspiration, *Little Arkansas River basin(Kan).

A digital computer model was developed to describe the hydrology of a stream basin and associated aquifer. The model simulates both surface-water and ground-water phases and their interaction. Input to the model includes precipitation, climatic conditions, boundary and initial conditions, and basin constants. Provision has been made for modeling withdrawals from both groundwater and surface waters for consumptive use. The computer output includes streamflow hydrographs at selected points, groundwater levels, and summaries of important moisture fluxes. The model was successfully tested by using it to simulate the hydrologic behavior of the Little Arkansas River basin in south-central Kansas. The model was used to simulate the 25 years from 1946 to 1970. The results of the simulation were evaluated by comparing the calculated daily discharges to actual streamflow data and the computed groundwater levels to observation well data at sixteen observation sites for the 25-year period. The groundwater heads at the end of 1970 were also compared to a pieziometric survey completed in the spring of 1971. The simulation results were considered quite good. Complex hydrologic features in the groundwater were maintained within the accuracy of the simulator and the time response of the groundwater heads in the observation wells closely followed the actual behavior of those wells. With the exception of extreme weather conditions, the computed basin discharges approximated the behavior of the actual basin.

COMPOSITIONAL MODELING OF HYDROGRAPHS (KOMPOZITSIONNOYE MODELIROVANIYE GIDROGRAFOV),
G. A. Grinevich, N. A. Petelina, and A. G. Grinevich.
Izdatel'stvo 'Nauka', Moscow, 1972. 183 p.

Descriptors: *Hydrographys, *Runoff, *Floods, *Model studies, *Statistical methods, Correlation analysis, Histograms, Probability, Stochastic processes, Markov processes, Variability, Fluctuations, Seasonal, Wet seasons, Dry seasons, Distribution patterns, Flood waves, Flood discharge, Curves, Equations.
Identifiers: USSR, Nomograms.

Processes in the grouping of wet and dry years on rivers are examined, and improved method of statistically describing and of modeling long-term and seasonal fluctuations of runoff are described. Possibilities are discussed for obtaining and considering additional information for more accurate estimation of the probability of development of different (including extremal) hydrologic situations on rivers, such as catastrophic floods, groups of dry and wet years, and runoff deficits. 2B. Precipitation

THE EFFECTS OF HURRICANE CAMILLE ON THE MARSHES OF THE MISSISSIPPI RIVER DELTA,
Louisiana State Univ., Baton Rouge. School of Forestry and Wildlife Management.
For primary bibliographic entry see Field 2L.
W74-04875

BOMEX RAINY DAY ANALYSIS,
National Oceanic and Atmospheric Administration, Washington, D.C. Center for Experiment Design and Data Analysis.
G. W. Elliott.
Technical Memorandum EDS BOMAP-10, July 1973. 9 p, 5 fig, 2 ref.

Descriptors: *Salinity, *Mixing, *Sea water, *Rainfall intensity, Data collections, Atlantic Ocean, Oceanography, *Precipitation intensity.

An investigation was made during the Barbados Oceanographic and Meteorological Experiment (BOMEX) in 1969 to evaluate the possibility of determining total precipitation from the change in salinity or temperature at the ocean surface. Salinity-temperature-depth (STD) soundings were taken at 3-hr intervals during periods of no rain, and at 5- to 6-min intervals during periods of rain. During periods of no rain, salinity regularly fluctuated by 0.015%. Fluctuations of this magnitude are likely to obscure possible salinity depressions due to rainfall. No rainfall-related long-term salinity depressions were evident. Many sharp, short-term depressions of salinity, on the order of 10 to 45 min, however, were observed during periods of rainfall. RAINFALL INTENSITIES IN ISRAEL,
Z. Schein, and N. Buras.
Israel Journal of Earth-Sciences, Vol 22, p 15-30, 1973. 3 fig, 5 tab, 10 ref.

Descriptors: *Depth-area-duration analysis, *Depth-area curves, *Rainfall, Arid lands, Distribution patterns, Probability, Frequency analysis, Hyetographs, Hydrologic data, Data collections, Climatic data, *Arid climates.
Identifiers: *Israel.

Rainfall-depth-duration-probability relations and regional rainfall distributions were developed for Israel from 17 recording gages with 14-33 years of records. Monthly probabilities for daily and shorter duration rainfall were estimated from five selected stations with long-term records. (Knapp-USGS)
W74-05123

LAKE MICHIGAN SNOW SQUALLS INCREASE ANNUAL PRECIPITATION IN THE UDELL HILLS,
Forest Service (USDA), Cadillac, Mich. North Central Forest Experiment Station.
D. H. Urie.
Available from NTIS, Springfield, Va. 22151, PB-223 489, Price $2.75 printed copy; $1.45 microfiche. Forest Service Research Note NC-120, 1971. 4 p, 3 fig, 1 tab, 4 ref.

Descriptors: *Snowfall, *Precipitation(Atmospheric), *Orography, *Lake Michigan, Topography, Water balance.
Identifiers: *Udell Hills(Mich).

Snow squall concentration in the Udell Hills of Michigan illustrates the effects of minor topographic features and the proximity of Lake Michigan on the seasonal distribution of precipitation. Water budget studies in areas of similar topography can use the relationships developed in this study. (Knapp-USGS)
W74-05124

A THEORY OF MICROWAVE APPARENT TEMPERATURE OVER THE OCEAN,
Kansas Univ./Center for Research, Inc., Lawrence.
S. T. Wu, and A. K. Fung.
Available from NTIS, Springfield, Va. 22151, NASA CR-2329, Price $4.50 (domestic); $7.00 (foreign) $1.45 microfiche. National Aeronautics and Space Administration Contractor Report CR-2329, November 1973. 146 p, 35 fig, 11 tab, 127 ref, append. NASA Contract NAS 1-10048.

Descriptors: *Microwaves, *Water temperature, *Remote sensing, Waves(Water), Meteorological data, Data collections, Weather data, Winds, Oceans.
Identifiers: *Microwave radiometry.

In the microwave region combined active (scatterometer) and passive (radiometer) remote sensors over the ocean show promise of providing surface wind speeds and weather information. Several approaches to the problem are now available, but none satisfactorily predict both the scattering and emission characteristics of the sea surface. The disagreement may be accounted for at least in part by the use of an improper surface model. A composite surface scattering theory is investigated as a more realistic approach. A two-scale scattering theory was extended to compute the emission and scattering characteristics of ocean surfaces. The effect of the small irregularities upon the scattering characteristics of the large undulations is included by modifying the Fresnel reflection coefficients; the effect of the large undulations upon those of the small irregularities is accounted for by averaging the scattering cross sections of the small irregularities over the surface normals of the large undulations. The wind dependent parameters of the theory are established by comparing the emission characteristic with measurement and by using measured sea slope data. Improved agreement with measured scattering and emission results over a single-surface theory is demonstrated by the composite theory. The effects of clouds and rain on the radiometer and scatterometer observations were also investigated using horizontally stratified model atmospheres with rough sea surfaces underneath. For heavy rainfall rates the effects of scattering on the radiative transfer process are included. Clouds and rains cause the radiometer to lose contact with the surface when clouds or rain intervene. However, the rise of apparent temperature can be used to compute the atmospheric attenuation and the scatterometer measurement can be corrected accordingly. (Knapp-USGS)
W74-05126

CHEMICAL COMPOSITION OF MONSOON RAINWATER OVER CHANDIGARH IN 1971,
Central Groundwater Board, Faridabad(India).
B. K. Handa.
Indian Geohydrology, Vol 9, No 1, p 31-37, June 1973. 2 tab, 23 ref.

Descriptors: *Water chemistry, *Rainfall, *Chemistry of precipitation, Water quality, Provenance.
Identifiers: *India(Chandigarh).

In rainwater over Chandigarh, India, bicarbonate ions and calcium ions are pre-eminent, so that the rainwater is primarily of the CaHCO3 type. The concentration of potassium ions is quite low but sometimes exceeds that of sodium ions. The weight ratio SO4/Cl also in some cases exceeds unity. Although the chloride ions are supposed to be mainly of marine origin, a comparison of the chemical analysis data of seawater with that of rainwater over Chandigarh shows that there is little resemblance between the two. However, the river water generally shows a great similarity to rainwater in the relative proportions of the various ions. The chemical composition of the rainwater varies quite irregularly. (Knapp-USGS)

W74-05143

20-24 YEAR CYCLE IN THE MARCH OF ATMOSPHERIC PRECIPITATION AND ITS RELATION TO AIR CIRCULATION PATTERNS (TSIKL 20-24 GODA V KHODE ATMOSFERNYKH OSADKOV I YEGO SVYZA' S OSOBENNOSTYAMI ATMOSFERNOY TSIRKULYATSII),
Leningrad State Univ. (USSR)
L. A. Kudryavtseva.
Vestnik Leningradskogo Universiteta, No 6, Seriya Geologiya-Geografiya, No 1, p 87-93, March 1973. 1 fig, 5 ref.

Descriptors: *Precipitation(Atmospheric), *Air circulation, *Cycles, *Meteorology, Cyclones, Anticyclones, Correlation analysis, Forecasting, Curves.
Identifiers: *USSR.

Results are presented of a study of a 20-24 year cycle of precipitation over the USSR and of its relation to air circulation patterns. A 20-24 year cycle in the march of precipitation is manifested over a relatively large expanse of the USSR during warm and cold periods of the year and determines the general moisture background of these areas. The appearance of a 20-21 year cycle in the march of precipitation during the warm period over central regions of the Urals and West Siberia is due to regeneration processes and is expressed by the number of days with precipitation greater than or equal to 10.0 mm in a 24-hour period. The 20-24 year cycle can be used to prepare a long-term precipitation forecast. (Josefson-USGS)
W74-05149

ANNOTATED BIBLIOGRAPHY ON PRECIPITATION MEASUREMENT INSTRUMENTS,
World Meteorological Organization, Geneva (Switzerland).
J. C. Rodda.
Report No 17, A WMO contribution to the International Hydrological Decade (IHD), 1973. 278 p.

Descriptors: *Rain gages, *Instrumentation, *Precipitation gages, *Bibliographies, Abstracts, Measurement.

Precipitation measurement is the subject of this bibliography. Few, if any, entirely new instruments and techniques are featured in this report. Perhaps the most novel are the optical devices that look at the falling drops and flakes, but there is far greater emphasis on the development of existing methods. The measurement of snow is a problem that still remains to be solved, and this also applie to the other less common forms of precipitation. A large number of studies have been conducted to in vestigate the sources of error in precipitation mea surement, the majority being concerned with thos affecting the assessment of rain. (Knapp-USGS)

THE EFFECT OF IMPURITIES ON THI MECHANICAL PROPERTIES OF ICE SINGLI CRYSTALS,
Department of the Environment, Ottaw (Ontario). Inland Waters Directorate.
T. Nakamura, and S. J. Jones.
Scientific Series No 24, 1973. 29 p, 45 fig, 3 tab, 3 ref.

Descriptors: *Ice, *Cryology, *Mechanical properties, *Stress strain, Crystallography, Aqueou solutions, *Tensile stress, Tensile strength, Ions.

Constant strain-rate tensile tests were carried ou on single crystals of ice doped with various impuri ties including HF, HCl, HBr, NH4F, NaF, KF NaOH, H2O2, NH4OH, and He. The tests were carried out in the temperature range of -5 deg C t -53 deg C. HF-doped crystals showed a softenin effect in this temperature range as well as in the lower temperature range previously reported HCl-doped crystals showed a less pronounced sof tening effect than HF. H2O2-doped crystal showed a softening effect at -26 deg C, one He doped crystal showed a hardening effect at -15 deg C, and the other impurities had no apparent effect An activation energy for pure ice of 18 plus o minus 2 kcal/mole was deduced; for HCl-dopec ice an activation energy of 12 plus or minus kcal/mole and 13 plus or minus 2 kcal/mole wa found using two methods of analysis. A power law relationship between stress and strain-rate wa found to hold for pure and HCl-doped crystals with n = 1.73 plus or minus 0.07. The distribution of fluorine and chlorine ions in the crystals showed marked increases in ion concentration towards the surface. (Knapp-USGS)

LONG-RANGE FORECAST OF DURATION OF ICE PHENOMENA ON THE DANUBE RIVER (DOLGOSROCHNYY PROGNOZ PRODOLZHITEL'NOSTI LEDOVYKH YAVLENIY NA R. DUNAYE),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
T. N. ,Makarevich, Z. A. Yefimova, and L. K. Savina.
In: Voprosy gidrologicheskikh prognozov; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 197, p 3-24, Leningrad, 1972. 7 fig, 4 tab, 45 ref, append.

Descriptors: *Ice, *Ice cover, *Forecasting, *Meteorology, Atmosphere, Air temperature, Atmospheric pressure, Air circulation, Synoptic analysis, Seasonal, Probability, Histograms, Curves.
Identifiers: *USSR(Danube River).

Problems relating to forecasts of the degree of severity of winters and of the duration of ice phenomena on the Danube River were investigated. Studies were made of the recurrence and probability of duration of ice phenomena for 4 unregulated reaches of the Danube from Bratislava to the river mouth between 1900 and 1968. The duration of ice phenomena on the Danube is closely related to air temperature in winter in Central Europe. Long-range forecast procedures were based on data on changes in the pressure field over Canada (1949-67) using the index of zonal circulation and on ground pressure data using the coefficient of expansion of pressure fields into natural components (1938-67). Forecast procedures based on use of the index of zonal circulation are preferred, and solutions obtained for the Lower Danube are more accurate than those for the Middle Danube because of the regime characteristics of the river's lower reaches and the greater continentality of the part of the basin. (See also W74-05141) (Josefson-USGS)
W74-05142

EFFECT OF HYDROMETEOROLOGICAL CONDITIONS ON TIME OF ICE FORMATION ON RIVERS IN THE BALTIC SEA REGION AND BELORUSSIA (VLIYANIYE GIDROMETEOROLOGICHESKIKH USLOVITY NA SROKI POYAVLENIYA L'DA NA REKAKH PRIBALTIKI I BELORUSSII),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
R. Ya. Alekseyenko.
In: Voprosy gidrologicheskikh prognozov; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 197, p 57-67, Leningrad, 1972. 3 fig, 4 tab, 8 ref.

Descriptors: *Ice, *Ice cover, *Rivers, *Meteorology, Atmosphere, Air circulation, Air temperature, Discharge(Water), Water temperature, Heat balance, Heat transfer, Seasonal, Correlation analysis, Forecasting, Equations.
Identifiers: *Baltic Sea Region, *USSR(Belorussia), Heat exchange.

The influence of major items in the hydrologic and meteorological regimes affecting the date at which ice starts to form on rivers in the Baltic Sea Region and Belorussia was investigated for development of improved long-term ice-growth forecasts. Studies were made of the relation of dates of ice formation to air temperature, stream discharge, water temperature, heat discharge, and total heat exchange between water and the atmosphere. Average monthly air temperature was used for 1901-50 for eastern regions (Velizh, Vitebsk, Daugavpils) and for 1903-50 for western regions (Vilnius, Yelgava), and average 10-day air temperature was used for 1937-67 (for Velizh and Vitebsk) and for 1946-67 (for Daugavpils and Grodno). To determine dates of ice formation, heat transfer from the water surface to air and air circulation processes must be considered. (See also W74-05141) (Josefson-USGS)
W74-05143

FORECASTING THE MAXIMUM LEVEL OF ICE JAMS ON THE SEVERNAYA DVINA RIVER AT ARKHANGEL'SK (PROGNOZ MAKSIMAL'NOGO ZATORNOGO UROVNYA VODY R. SEVERNOY DVINY U G. ARKHANGEL'SKA),
Godsudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
R. A. Nezhikhovskiy, and N. P. Sakovskaya.
In: Voprosy gidrologicheskikh prognozov; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 197, p 68-83, Leningrad, 1972. 5 fig, 4 tab, 8 ref.

Descriptors: *Ice, *Ice cover, *Ice jams, *Forecasting, Ice breakup, Discharge(Water), Inflow, Floods, Flood waves, Water levels, Profiles, Correlation analysis, Curves, Equations.
Identifiers: The maximum level of ice jams in the estuarine region of the Severnaya Dvina River, especially near Arkhangel'sk, is determined primarily by the rate of water discharge during the period of ice breakup on the river. A close empirical relation is established between the maximum level of ice jams and both the water discharge of the river at Abramkovo village and lateral inflow in the Abramkovo-Arkhangel'sk reach on the same day. The forecast is timed to coincide with the last day of thick, continuous ice cover at Abramkovo and can be made, on the average, 5-7 days in advance. (See also W74-05141) (Josefson-USGS)
W74-05144

THEORY OF METAMORPHISM OF WET SNOW,
Cold Regions Research and Engineering Lab., Hanover, N.H.
S. C. Colbeck.
Research Report 313, December 1973. 11 p, 7 fig, 13 ref.

Descriptors: *Snow, *Crystal growth, *Cryology, Avalanches, Melting, Freezing, Snowmelt, Permeability, Porosity, Temperature.
Identifiers: *Snow metamorphism.

Metamorphism by grain growth, bond growth, and densification of wet snow are described in terms of the distribution of equilibrium temperature in the snow matrix. At high water saturations the equilibrium temperature increases with grain size; hence, small particles melt away as large particles grow. Melting also occurs at the intergrain bonds, causing a low strength and rapid densification. At low saturations the equilibrium temperature is determined by the capillary pressure and the particle sizes have only a second order effect. Therefore, grain growth proceeds slowly and, even at large overburden pressures, no intergrain melting occurs. At low saturations the water tension acts through a finite area, thus large attractive forces exist between the grains, and the strength of the snow matrix is large. The behavior of wet snow governs the release of wet-snow avalanches and water runoff through seasonal snowpacks. The performance of oversnow vehicles and construction on snow covers are matters of practical necessity involving wet snow as a material. (Knapp-USGS)

THE AIDJEX LEAD EXPERIMENT,
Oregon State Univ., Corvallis. Dept. of Oceanography.
C. A. Paulson, and J. D. Smith.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 1-8, January 1974. 1 fig, 5 ref.

Descriptors: *Sea ice, *Movement, Currents(Water), Winds, Navigation, Heat transfer, Freezing, Convection, Heat flow, *Alaska.
Identifiers: Leads(Icepacks).

To study sea-ice movement, an open-lead experiment is planned. Atmospheric and oceanic observations are made at a newly created lead offshore from Barrow, Alaska. The atmospheric observations attempt to measure the vertical flux of heat and determine its relation to air-sea temperature difference, fetch, height, and wind speed. The oceanic observations seek to determine the characteristics of the density-driven convection in the vicinity of a lead by measuring the oceanic velocity and density fields. (Knapp-USGS)

SUBSURFACE EDDIES IN THE ARCTIC OCEAN,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
K. L. Hunkins.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 9-36, January 1974. 17 fig, 1 tab, 11 ref. ONR Contract N00014-67-A-0108-0016.

Descriptors: *Eddies, *Arctic Ocean, *Ocean currents, Currents(Water), Mixing, Salinity, Density stratification, Turbulence, Vortices.

Transient undercurrents associated with eddies in the Arctic Ocean were observed at depths between 50 and 300 m. The velocity profile was parabolic with a maximum of 40 cm/sec at 150 m. A distortion of the salinity and temperature field accompanied these currents, and gradient equilibrium was closely approached in each case. The eddies persisted for several days. They were 10 to 20 km in diameter and were separated by 20-50 km. The eddies have their origin in the instability of the basic baroclinic current. A large-scale horizontal salinity gradient is produced by global conditions of oceanic precipitation-evaporation and modified by wind conditions. The currents accompanying such a density gradient are not stable but rather lead to growing disturbances. As the disturbances amplify, the potential energy of the horizontal density gradient is converted into the kinetic energy of eddies. (Knapp-USGS)
W74-05159

A RELATION BETWEEN THE POTENTIAL ENERGY PRODUCED BY RIDGING AND THE MECHANICAL WORK REQUIRED TO DEFORM PACK ICE,
Washington Univ., Seattle. Div. of Marine Resources.
D. A. Rothrock.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 45-51, January 1974. 5 ref.

Descriptors: *Sea ice, *Deformation, *Plastic deformation, Movement, Equations, Yield strength, Poisson ratio, Failure(Mechanics), Buckling, Mechanical properties.
Identifiers: Ice mechanics.

The rate of production of potential energy by mechanical processes that change the thickness distribution of sea ice provides a useful lower bound for the rate of work by the two-dimensional stress in pack ice. A formal relation is derived between the plastic work and the increase of potential energy due to all ridging processes represented by the redistribution function. Since

the redistribution function can depend in general on twotdimensional strain rates, the extension to the two-dimensional case is included without further derivation. (Knapp-USGS)
W74-05160

REDISTRIBUTION FUNCTIONS AND THEIR YIELD SURFACES IN A PLASTIC THEORY OF PACK ICE DEFORMATION,
Washington Univ., Seattle. Div. of Marine Resources.
D. A. Rothrock.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 53-81, January 1974. 22 fig, 9 ref.

Descriptors: *Sea ice, *Deformation, *Plastic deformation, Movement, Equations, Yield strength, Poisson ratio, Failure(Mechanics), Buckling, Mechanical properties.
Identifiers: *Ice mechanics.

A large-scale area of pack ice contains ice from zero to many meters thick. As the pack ice deforms, thin ice is ridged into thicker ice, in a way that depends on the strain rate and the instantaneous thickness distribution. The rate of this process is assumed to be proportional to the rate of deformation, and fixed proportions (by area) of the thinner ice are assumed to be ridged into ice of known thicknesses. The amount of this ridging is assumed to depend on the angle whose tangent is the ratio of the shearing rate to the divergence rate. The potential energy required to perform this ridging is equated to the plastic work performed by the horizontal ice stress. The ice is assumed to behave plastically. For stresses inside a yield surface, the ice is rigid. Stresses on the yield surface cause the ice to flow by the rule that the strain rate tensor is normal to the yield surface in stress space. The size of the yield surface depends on the thickness distribution. (Knapp-USGS)
W74-05161

DIMENSIONLESS STRENGTH PARAMETERS FOR FLOATING ICE SHEETS,
Washington Univ., Seattle. Dept. of Aeronautics and Astronautics.
R. R. Parmerter.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 83-95, January 1974. 5 fig, 8 ref. NSF Grant GV-28807.

Descriptors: *Sea ice, *Deformation, *Plastic deformation, Movement, Equations, Yield strength, Poisson ratio, Failure(Mechanics), Buckling, Mechanical properties.
Identifiers: *Ice mechanics.

The equations governing a floating ice sheet subjected to vertical loading were studied in dimensionless form. In thin sheets, the ratio of transverse shear to bending stress is proportional to the fourth root of thickness, so that bending stress dominates. Thus, simple plate theory, which ignores the deformation due to shear, may be used for ice sheets up to several meters thick. The bending stress in the sheet may be incorporated into a dimensionless strength parameter that depends on the functional form of the loading and Poisson's ratio. Where the loading is one dimensional, the strength parameter depends only on the form of the loading. The more complex problem in which in-plane forces interact through the vertical deformations to create additional loading was also studied. This class of problems includes problems of elastic buckling. The problem of the rafting of ice, in which one sheet overrides another without breaking, is an example. The stress parameter is calculated as a function of the geometry of the rafting sheet. If the actual strength of the ice is such that the strength parameter falls below the solution curve, the ice will break before it rafts. The maximum thickness of ice that can raft without breaking depends on the square of the ice thickness. The calculation of 17 cm for typical young sea ice agrees well with field observations, although older ice, because of its greater strength, can raft when it is several meters thick. (Knapp-USGS)
W74-05162

A MECHANICAL MODEL OF RAFTING,
Washington Univ., Seattle. Dept. of Aeronautics and Astronautics.
R. R. Parmerter.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 97-115, January 1974. 6 fig, 8 ref, append. NSF Grant GV-28807.

Descriptors: *Sea ice, *Deformation, *Plastic deformation, Movement, Equations, Yield strength, Poisson ratio, Failure(Mechanics), Buckling, Mechanical properties.
Identifiers: *Rafting(Sea ice).

The simple rafting of two ice sheets of equal thickness is investigated. The force required to initiate rafting is small compared to the force required to buckle the ice sheet. Maximum stresses occur in the submerged portion of the overridden sheet. As the thickness of the sheets is increased, the maximum stress developed during rafting increases. Thus, there exists a critical ice thickness at which rafting causes the overridden sheet to fail. Ice thicker than this critical value will fail and therefore cannot raft. The ice blocks that are broken from the sheet during failture of rafting provide rubble, which then produces a ridge structure. Thus, thick ice tends to deform through ridging and thin ice tends to raft. (Knapp-USGS)
W74-05163

ON THE CALCULATION OF THE ROUGHNESS PARAMETER OF SEA ICE,
Washington Univ., Seattle. Div. of Marine Resources.
C-H. Ling, and N. Untersteiner.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 117-125, January 1974. 4 fig, 1 tab, 14 ref. NSF Grant GV-28807, NSF Grant C-625.

Descriptors: *Sea ice, *Air-water interfaces, *Roughness coefficient, Boundary processes, Winds, Movement, Friction, Turbulent flow, Topography.
Identifiers: *Roughness(Mechanical), Ice dynamics.

A method is described for calculating the roughness parameter of sea ice from velocity profiles. Instead of the conventional procedure of determining an individual roughness for each velocity profile, this method uses a number of profiles to find a single value. By means of a set of data obtained in the Arctic, it is shown that the method greatly reduces the scatter in roughness and produces consistent values for the friction velocity. (Knapp-USGS)
W74-05164

CLASSIFICATION AND VARIATION OF SEA ICE RIDGING IN THE ARCTIC BASIN,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. D. Hibler, III, S. J. Mock, and W. B. Tucker, III.
AIDJEX Bulletin No 23, Washington University Division of Marine Resources, p 127-146, January 1974. 5 fig, 6 tab, 16 ref, append.

Descriptors: *Sea ice, *Deformation, *Plastic deformation, Movement, Equations, Yield strength, Poisson ratio, Failure(Mechanics), Buckling, Mechanical properties, *Arctic.
Identifiers: *Ridging(Sea ice).

A one-parameter model for pressure ridges agrees well with more than 3000 km of laser profile data taken from November 1970 to February 1973 in the Arctic basin. Ridging intensity may be determined for a region from the mean number of ridges per unit length and the mean ridge height. Using ridging intensity the number of ridges per kilometer at any ridge height level may be predicted. Although magnitudes of ridging intensity vary in time, the relative regional variations are similar. Consequently, three distinct regions of ridging intensity having relatively stable boundaries can be defined. Annual variation in new ice production due to ridging is sufficiently large to suggest that ridging plays an important role in the overall mass balance of the Arctic basin. (Knapp-USGS)

AN INVESTIGATION OF CORE DRILLING IN PERENNIALLY FROZEN GRAVELS AND ROCK,
Cold Regions Research and Engineering Lab., Hanover, N.H.
G. R. Lange.
Technical Report 245, December 1973. 26 p, 5 fig, 2 tab, 8 ref, 2 append.

Descriptors: *Core drilling, *Permafrost, *Frozen ground, Boreholes, Cores, Drilling fluids, Drilling, Rotary drilling, Sampling, Drilling equipment, Drilling samples.

The problems of obtaining frozen samples by core drilling of perennially frozen gravel and rock were investigated. Most of the core drilling was carried out in ice-bonded, well-graded alluvial gravel with the ground temperature near its freezing point. Both chilled compressed air and oil-based liquids were used as drilling fluids. The details of both successful and unsuccessful coring attempts are reported. Drilling variables such as weight on the bit, rotational velocity, rate of penetration, fluid temperatures, viscosities, flow rates and pressures and mechanical details of the diamond bits are reported. To make the information more widely applicable, calculated values for the pressure on the bit, the lineal velocity range of the diamond points, the force per diamond point, and the uphole velocity of the fluid stream are given. Some core drilling was also successfully accomplished in frozen, fractured rock. With careful control of the drilling variables, good samples of these difficult materials can be obtained at satisfactory drilling rates so long as the material is well bonded by ice. Suggestions are given for improvement of equipment and methods. (Knapp-USGS)

2D. Evaporation and Transpiration

PAN AND LAKE EVAPORATION IN PENNSYLVANIA,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
J. J. Rahn.
Available from NTIS, Springfield, Va. 22151, COM-73-11435, Price $3.50 printed copy; $1.45 microfiche. Information Report No 69, May 1973. 23 p, 6 fig, 3 tab, 10 ref.

Descriptors: *Evaporation, *Pennsylvania, *Data collections, Hydrologic cycle, *Evaporation pans, Evaporimeters, Reservoir evaporation, Lakes.
Identifiers: Lake evaporation.

All available sources of pan evaporation data in Pennsylvania are compiled to provide an updated and more detailed analysis than was possible with national maps. Class A pan evaporation is com-

pared to evaporation from lakes and other water bodies. Mean annual pan evaporation ranges from about 48 inches in the lower Susquehanna River region to slightly less than 32 inches in the north-central section of the State. Mean annual lake evaporation follows the same general pattern, from about 36 to less than 24 inches. Mean monthly and seasonal values, 90% probability limits, and observed extremes are summarized for six stations with long-term records. Highest mean monthly pan evaporation occurs in July, ranging from about 5.5 to 7.5 inches. Daily extremes in evaporation losses from pans are estimated to range between zero and 0.6 inch. (Knapp-USGS)
W74-05121

COMPARISON BETWEEN PAN AND LAKE EVAPORATION,
C. E. Hounam.
World Meteorological Organization Technical Note No 126, 1973. 52 p, 7 fig, 12 tab, 27 ref.

Descriptors: Evaporation, *Evaporimeters, Calibrations, *Evaporation pans, Reservoir evaporation, Lakes.
Identifiers: *Lake evaporation.

The simplest and most common means of estimating lake evaporation is on the basis of data obtained from pan and tank evaporimeters. The most important types of evaporimeter that are in use are described, with details of their construction and advice on their use. The factors having an influence on pan and lake evaporation are discussed in relation to the various coefficients that have been developed for converting the evaporation rates from pans and tanks to estimates of lake evaporation. These coefficients vary significantly in space, in time, and in relation to the particular characteristics of the lake in question. A description is given of the methods proposed for correcting them so as to eliminate the effects of such variations. (Knapp-USGS)

LONGSHORE CURRENTS GENERATED BY OBLIQUELY INCIDENT SEA WAVES,
Oregon State Univ., Corvallis.
M. S. Longuet-Higgins.
Journal of Geophysical Research, Vol 75, No 33, p 6778-6789, November 20, 1970. 4 fig, 5 tab, 32 ref.

Descriptors: *Waves(Water), *Mixing, *Turbulence, Coasts, Beaches.
Identifiers: *Longshore current, Radiation stress, *Wave energy, *Bottom friction, *Surf zone, Nearshore processes.

There exists a simple and precise relationship between the total longshore thrust exerted by the incoming waves on the one hand and their direction and amplitude in deep water on the other. This can be derived either from the concept of the radiation stress, or by a direct evaluation of the momentum flux due to the waves. The local longshore stress due to the waves is very simply related to the local rate of dissipation of wave energy, regardless of whether the dissipation is due to wave breaking or to bottom friction. Hence, using the known relation of breaker height to local depth in the surf zone, one can estimate accurately the local longshore stress due to the waves. When the local longshore wave stress is known, it is possible to write an equation of motion for the longshore current that involves in general both the bottom friction and the horizontal mixing by turbulent eddies. If the horizontal mixing is negligible, the momentum balance gives an exceedingly simple expression for the longshore current. The addition of horizontal mixing generally reduces the current, although not drastically. (Sinha-OEIS)

FLOOD STAGES AND DISCHARGES FOR SMALL STREAMS IN TEXAS,
Geological Survey, Austin, Tex.
E. E. Schroeder.
Open-file report, 1973. 297 p, 1 fig, 3 tab, 10 ref.

Descriptors: *Data collections, *Flood data, *Texas, Small watersheds, *Hydrologic data, Flood forecasting, Peak discharge.

Basic hydrologic data are compiled to be used to define the magnitude and frequency of floods for drainage areas of less than 20 square miles in Texas. To accomplish the objective, a network of 150 crest-stage partial-record gages was established. These gages are distributed throughout the State to sample all hydrologic areas and flood-frequency regions as defined by Patterson (1963) and to obtain a representative sample of physical characteristics. Information for unusual peak discharges at ungaged sites is obtained as the opportunity arises. Each gage site is equipped with one or more crest-stage gages and a stage-rainfall recorder. A typical installation consists of two crest-stage gages--one headwater gage and one tailwater gage. Data are being collected at 82 other small-stream stations for other projects, making a total of 232 stations available for this study. During the 1971 water year, annual runoff was deficient in the north, east, and central parts of the State, below average in the west, and average in the south. Runoff at individual sites varied greatly. Several streamflow stations in the southern Edwards Plateau area recorded new peak discharges for the period of record. This occurred during the period Aug. 11-14. No widespread major flooding occurred during the year. Numerous flash floods covering relatively small areas did occur. Tropical disturbances caused heavy rainfall in some coastal areas. (Knapp-USGS)

ON THE POSITION OF TIDAL BARRIERS IN NORTHUMBERLAND STRAIT,
Department of the Environment, Ottawa (Ontario). Marine Sciences Directorate.
K. B. Yuen.
Manuscript Report Series, No 33, 1973. 26 p, 11 fig, 6 ref.

Descriptors: *Numerical analysis, *Tides, *Water level fluctuations, Mathematical models, Inlets(Waterways), Water levels, Currents(Water), Seiches, *Canada.
Identifiers: *Causeways.

A one-dimensional mathematical tidal model was constructed which reproduces satisfactorily the normal M2, S2, K1, and O1 tidal constituents in Northumberland Strait, Canada. Calculations for the construction of complete tidal barriers at a range of locations indicated that the vicinity of the Cape Tormentine area is very critical for the semidiurnal constituents, especially for the resulting tide on the eastern side of a causeway. The worst case resulted in an M2 head difference of order 9.0 feet from one side of the causeway to the other, yet a shift of less than 12.0 miles could reduce this to only 5.0 feet. In contrast, the diurnal constituents were relatively insensitive to the exact causeway location. For the Cape Tormentine area, the M2 configuration was also examined for the case of partial barriers. Even for 90% closure, the head difference across the causeway was only 1.0 foot. However, the currents increased with greater closure, but even for 80% closure, the M2 current was only 6.0 feet/sec. (Knapp-USGS)

Identifiers: USSR, *Japan current(Kuroshio), Ocean weather stations.

Variations in oceanographic conditions were investigated in the region of ocean weather stations 'Extra' ('X') and 'Tango' ('T') in the North Pacific Ocean between July 1951 and November 1953. Intensity and frequency of seasonal fluctuations with time scales ranging from 2-3 days to 3-4 months were determined in the 0- to 1,000-m layer by statistical analysis of water temperature. Seasonal fluctuations of water temperature in the region depend little on fluctuations in the heat balance of the sea surface but are caused mainly by fluctuations in the advection of heat by currents and internal waves. The classical solutions for the relationship between geostrophic, Ekman layer, and surface layer flow were developed into a continuous solution for the semi-infinite flow over a surface. This solution leads to a two-layer composite boundary layer solution with matching criteria. The matching process indicates a correspondence between the stress and the geostrophic flow deviation involving two arbitrary parameters. Some values of these similarity constants determined from data for neutral and stratified boundary layers are discussed. (Knapp-USGS)

STORM OF MAY 5-6, 1973, IN THE DENVER METRO AREA: FREQUENCY AND EFFECT,
Geological Survey, Denver, Colo.
G. L. Ducret, Jr., and W. R. Hansen.
Urban Drainage and Flood Control District, Denver, 1973. 40 p, 6 fig, 5 tab, 2 ref, 2 append.

Descriptors: *Floods, *Colorado, Rainfall-runoff relationships, Flood frequency, *Flood data, Hydrologic data, Flood recurrence interval, Peak discharge.
Identifiers: *Denver(Colo).

A light drizzle that began to fall on parts of the Denver metropolitan area late Saturday evening, May 5, 1973, was the forerunner of a general long-duration rainstorm which, by daylight Sunday, had saturated the soils of the area and sent creeks and gullies swelling with runoff. Rainstorm total precipitation ranged from 2.06 to 4.38 inches at U.S. Geological Survey rainfall-runoff stations in the Denver area. By midday on Sunday the small streams had reached their peak discharge; many canal banks, weakened by capacity flows, broke; reservoirs were spilling; and lakes were flooding adjacent areas. Meanwhile, the South Platte River and major tributaries within the storm area were rising toward peak discharges late Sunday night and early Monday morning. The main-stem South Platte River stations from Littleton to Henderson experienced peak discharges ranging in magnitude from that of a 50-year flood to 1.4 times the 50-year flood. (Knapp-USGS)

GEOTHERMAL ENERGY, A NATIONAL PROPOSAL FOR GEOTHERMAL RESOURCES RESEARCH.
Alaska Univ., College.
Available from the National Technical Information Service as PB-216 423; $4.85 in paper copy, $1.45 in microfiche. Final Report of the Geothermal Resources Research Conference, Battelle Seattle Research Center, Seattle, Wash., Sept 18-20, 1972, Alaska University Publication, 1973. 95 p, 4 tab, 123 ref. NSF Project NSF/RA/N-73-003. Grant GI-34313.

Descriptors: *Geothermal studies, *Conferences, Thermal power, Research and development.
Identifiers: *Geothermal energy.

The National Science Foundation, through its RANN Energy Research and Technology Program, supported this geothermal resources research conference under the chairmanship of former Secretary of the Interior Walter J. Hickel. The objective of the conference was to develop an assessment of the state-of-the-art of geothermal science and technology and to recommend a research program to provide the requisite knowledge for establishing the proper role of geothermal resources in providing additional energy to alleviate the Nation's impending shortage. A further objective was to investigate the potential of geothermal water to supplement present national freshwater supplies. The panel topics were: resource exploration, resource assessment, reservoir development and production, utilization technology and economics, environmental effects, and institutional considerations. A research program should include both short range and long range goals. One of the first tasks is to undertake a research program at an adequate level to better define the magnitude of the resource and accelerate its development. Such a program should include: development of binary fluid power-generating systems; development of improved exploration methods; development of desalination methods for geothermal fluids; development of better models of geothermal reservoirs; and development of faster, cheaper methods for deep drilling into hot formations. (Knapp-USGS)

PRACTICAL SIMULATION MODELS OF THE SUBSURFACE HYDROLOGIC SYSTEM WITH EXAMPLE APPLICATIONS,
Auburn Univ., Ala. Dept. of Civil Engineering.
F. J. Molz.
Available from the National Technical Information Service as PB-228 963, $5.50 in paper copy, $1.45 in microfiche. Auburn University, Alabama. Water Resources Research Institute Bulletin 19, 1974. 46 p, 8 fig, 8 tab, 3 append. OWRR A-029-ALA(1).

Descriptors: Groundwater, *Recharge, *Simulation analysis, *Groundwater movement, Hydrologic budget, *Water table, Aquifers, Computer models, Numerical analysis, Model studies, *South America, *Subsurface flow.
Identifiers: *Colombia(So. Amer.).

Several practical models of the subsurface hydrologic system are constructed. These models have as their core the two-dimensional groundwater flow equation with a vertical recharge term and subject to the assumption of horizontal flow. The recharge term is used to represent the hydrologic processes on the surface and in the unsaturated zone as far as their input to the groundwater system is concerned. In this sense, the models can be used to simulate the subsurface hydrology of a watershed--not simply the groundwater system. Various methods are discussed for evaluating the recharge term including a simple water mass balance, a climatological water balance, a more complex water balance and a recharge distribution based on the USDAHL-70 model of watershed hydrology. Application of several of the models to a watershed in Colombia, South America indicates that the models are relatively easy to apply. Solution is obtained using a program developed by Prickett and Lonnquist (1971) which utilizes an alternating direction, line iteration technique. Flow charts, program listings, and example problems are included.

FUNDAMENTALS OF KARST SCIENCE. VOLUME 2 (OSNOVY KARSTOVEDENIYA. TOM II),
Perm State Univ. (USSR). Inst. of Karst Studies and Speleology.

G. A. Maksimovich.
Permskiy Gosudarstvennyy Universitet, Perm, 1969. 530 p.

Descriptors: *Karst, *Karst hydrology, *Bibliographies, Subsurface drainage, Carbonate rocks, Limestones, Caves, Groundwater, Aquifers, Artesian aquifers, Hydrogeology, Areal hydrogeology, Structural geology, Folds(Geologic), Erosion, Springs, Rivers, Lakes, Runoff, Geologic time, Maps.
Identifiers: USSR, *Thermokarst, Karst regions.

Volume 2 of 'Fundamentals of Karst Science' represents an expanded approach to the problems associated with the study of karst. Intended for use by hydrogeologists, geologists, geographers, planners, and other professionals engaged in karst investigations, the book is divided into 3 parts: (1) problems of karst hydrogeology (including general, applied, and regional hydrogeology of karst); (2) rivers and lakes of karst regions; and (3) some special types of karst (chalk karst and hydrothermokarst). An extensive bibliography of Soviet and foreign literature is included. (Josefson-USGS)

PRELIMINARY STUDIES ON THE MECHANISMS CONTROLLING THE SALINITY IN NORTHWESTERN ARID REGION OF INDIA--A DISCUSSION ON THE CAUSES OF SALINITY IN THE GROUNDWATER REGIME,
Central Groundwater Board, Faridabad (India).
V. Ramesam, and S. K. Barua.
Indian Geohydrology, Vol 9, No 1, p 10-18, June 1973. 2 fig, 12 ref.

Descriptors: *Saline water, *Saline water systems, *Surface-groundwater relationships, Brines, Evaporation, Salinity, Water chemistry, Arid lands, Salts, Evapotranspiration.
Identifiers: *India.

The salinity of surface water bodies cannot be understood independent of the salinity of underlying groundwater. Based on the chemical analytical results of more than 700 groundwater samples from the water table zone of the districts of Kutch, Gujarat, and Jaisalmer, in Rajasthan, India, an attempt was made to understand the mechanism controlling the groundwater chemistry in the arid region of northwestern India. The cation and anion relations with respect to total dissolved solids indicate evapotranspiration and consequent fractional separation of salts as the dominant process rather than proximity to the sea and transportation of saline matter from the sea. Centro di Ricerca IBM di Venezia (Italy).
G. Gambolati, P. Gatto, and R. A. Freeze.
Science, Vol 183, No 4127, p 849-851, March 1, 1974. 2 fig, 6 ref.

Descriptors: *Subsidence, *Land subsidence, *Withdrawal, *Artesian aquifers, Compaction, Floods, Seiches, Mathematical models.
Identifiers: *Italy(Venice).

Land subsidence at Venice (Italy) is the result of sediment compaction in the unconsolidated aquifer system that underlies the Venetian Lagoon. Compaction is caused by extensive groundwater withdrawals at the nearby industrial port of Marghera. The total subsidence at Venice for the period from 1930 through 1973 has been about 15 cm. Predictive simulations with a calibrated mathematical model were hampered by the sparseness of available data, but they suggest that if withdrawals are kept constant in the future as they have been since 1969, about 3 cm of further subsidence can be expected. G. F. Larionov.
Vestnik Leningradskogo Universiteta, No 6, Seriya Geologiya-Geografiya, No 1, p 59-62, March 1973. 17 ref.

Descriptors: *Geochemistry, *Trace elements, *Groundwater, *Dissolved solids, *Salts, Ions, Ion transport.
Identifiers: *USSR(Kazakhstan), Mineralization.

Most investigators contend that the content of trace elements in waters of varied dissolved-solids content is controlled mainly by the product of solubility and stability of their natural compounds, coprecipitation of microadmixtures with relatively insoluble compounds, and the sorption capacity of rocks. Judging from results of experiments and on-site investigations, these factors are significant only when trace element contents considerably exceed their actual concentrations in natural waters and when there is a sudden change in the conditions of the environment. In all probability, the cause of the relation between salt content in solution and trace element concentration should be sought in the internal structure of molecular processes occurring in groundwater. The concentration of negatively hydrated ions, which include most anions and some cations, increases with increasing dissolved-solids content of natural waters. Between positively hydrated ions (which include almost all cations) and dissolved-solids content of the waters, this relation apparently does not exist. (Josefson-USGS)

COMPARATIVE CHARACTERISTICS OF DESERT SOILS OF USSR AND AUSTRALIA, (IN RUSSIAN),
L. A. Dorokhov.
Probl Osvoeniya Pustyn', 2p 18-31. 1972, (English summary).
Identifiers: *Australia, Claypans, Climates, *Desert soils, Magnesium, Proluvial soils, Salts, *USSR, *Soil comparisons.

In Australia's arid zone, soil evolutionary history differs from that in desert of USSR. Australian soils are developed from lateritic material formed during intensive weathering in a humid period. The paleosubtropical as well as paleotropical conditions have almost no effect on recent soils in arid lands of USSR. The stony tableland soils (solonetz soils) of Australian arid zone have large amounts of Mg, and thus they may be expected to be similar to vertisols, rather than to Middle Asia grey-brown soils. Sandplain and sandridges of Australia are of proluvial origin, whereas the sand expanses in arid parts of USSR are reworked by powerful river courses. The genesis and morphological characteristics as well as salt profile of claypans strongly resemble those of takyrs. Both types of soils are widespread. The modern soils evolutionary processes show evidence of carbonate and sulfate accumulation which seems to be universal.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF DIBBLING OF WINTER FALLOW ON HYDROPHYSICAL PROPERTIES OF FROZEN SOIL AND ON EROSION PROCESSES (VLIYANIYE LUNKOVANIYA ZYABI NA VODNO-FIZICHESKIYE SVOYSTVA MERZLOY POCHVY I PROTSESSY EROZII),
I. A. Pabat.
Pochvovedeniye, No 12, p 105-113, 1972. 1 fig, 6 tab, 18 ref.

Descriptors: *Land management, *Fallowing, *Erosion control, *Frozen soils, *Soil physical properties, Bulk density, Compaction, Permeability, Infiltration, Infiltration rates, Soil moisture, Moisture content, Melt water, Snowmelt, Runoff, Slopes, Ice, Freezing.
Identifiers: *USSR(Ukraine), *Dibbling.

Field investigations were made of water and air permeability of frozen soil, melt-water runoff, and soil erosion as a function of soil moisture content, snow accumulation, depth of soil freezing, and fallow cultivation practices on slopes in the central steppe of the Ukraine. Dibbling on slopes was found to reduce to some extent the moisture content and compaction of the upper 10-cm layer of soil between the holes and the depth of freezing under them. This increased the water and air permeability of frozen soil during spring snowmelt, thereby reducing runoff and soil erosion by a factor of 2-10. Destruction of the upper water-impermeable soil layer and of the ice crust by dibbling prior to spring snowmelt may prove to be a reliable and promising method of water conservation and erosion control. Effectiveness of the LOD-10 dibbler in controlling water and wind erosion of soils is noted. (Josefson-USGS)

WATER-HOLDING CAPACITY OF COARSE AND MEDIUM LOESSLIKE LOAMS (O VODOUDERZHIVAYUSHCHEY SPOSOBNOSTI LEGKIKH I SREDNIKH LESSOVIDNYKH SUGLINKOV),
L. G. Balayev.
Pochvovedeniye, No 12, p 92-98, 1972. 2 fig, 9 ref.

Descriptors: *Soil physics, *Soil moisture, *Retention, *Loam, *Loess, Soil water movement, Capillary action, Field capacity, Wetting, Pore water, Equilibrium.
Identifiers: *USSR(Tadzhikistan-northern Causasus).

Moisture content in the zone of aeration of loess was determined in the Vaksh Valley of Tadzhikistan and in the Northern Caucasus. Pore water of loam and clay soils in the moisture range from minimum moisture capacity to interrupted capillary moisture is capable of moving by gravity in the liquid droplet state. Complete moisture equilibrium occurs in the soils at interrupted capillary moisture. A relation was found between mobility of suspended water and moisture content of the underlying soils. Since suspended water of loam and clay soils at minimum moisture capacity is not in a state of equilibrium, the term 'minimum moisture capacity' should be replaced by that of 'field capacity.' (Josefson-USGS)

SOIL RESPIRATION, NITROGEN MINERALIZATION AND HUMUS DECOMPOSITION OF EAST AFRICAN SOILS AFTER DRYING AND REMOISTENING (IN GERMAN),
Forschungsanstalt fuer Landwirtschaft, Braunschweig (West Germany). Institut fuer Bodenbiologie.
G. Jagnow.
Z Pflanzenernaeh Bodenkd, Vol 131, No 1, p 56-66, 1972, English summary.
Identifiers: *Africa, *Humus decomposition, *Mineralization, *Nitrogen, Respiration, *Soils.

Soil respiration and N mineralization of 51 East African cultivated, savanna and forest soils were compared after 3 and 21 wk of air drying. The average soil respiration after 21 wk of drying was 1.221 plus or minus 0.106 times higher than that after 3 wk of drying whereas the average N mineralization was not increased significantly (factor 1.132 plus or minus 0.256). The increase in soil respiration was correlated positively with the water soluble organic matter. During air drying of 3 days and moist incubations of 4 days at 30C, which were repeated 20 times in 10 soils, 3-10% of the organic C and 8-19% of the organic N (low humus vertisol 69%) were mineralized. Changes in the amount and the extinction of humic and fulvic acids were considered to be indicative for an increased humification during the drying and remoistening of soils.--Copyright 1973, Biological Abstracts, Inc.

THE INFLUENCE OF PRECIPITATION AND ALTITUDE ON THE HUMUS CONTENT OF EAST AFRICAN SOILS (IN GERMAN),
Forschungsanstalt fuer Landwirtschaft, Braunschweig (West Germany). Institut fuer Bodenbiologie.
G. Jagnow.
Z Pflanzenernaeh Bodenkd, Vol 131, No 1, p 13-21, 1972, Illus, English summary.
Identifiers: *Africa, Altitude, *Carbon, *Humus, *Nitrogen, Precipitation, *Soils.

Positive correlations were found between the log of the C and N content of the 0-15 cm soil layer, altitude and average annual precipitation of 20 grassland soils, 13 forest soils and 21 cultivated soils at altitudes of 10-2840 m and a precipitation of 380-2410 mm in Kenya, Tanzania and Uganda. For each of the soil groups equations with the 2 variables, altitude and precipitation, were derived, which accounted for 76-93% of the variation of the C (0.42-5.62%) and N (0.04-0.71%) content. There was no correlation between altitude precipitation and the C/N ratio of the soils.--Copyright 1973, Biological Abstracts, Inc.

EOLIAN ORIGIN OF MICA IN HAWAIIAN SOILS,
Oregon State Univ., Corvallis. School of Oceanography.
J. Dymond, P. E. Biscaye, and R. W. Rex.
Geological Society of America Bulletin, Vol 85, No 1, p 37-40, January 1974. 1 fig, 2 tab, 19 ref.
NSF Grants GA-30794X and GX-28671(CLIMAP).

Descriptors: *Aeolian soils, *Clay minerals, *Hawaii, Radioactive dating, Quartz, Mineralogy, Provenance, Soil formation.
Identifiers: Mica, *Oahu(Hawaii).

Mica- and quartz-bearing soils from the high-rainfall regions of the island of Oahu were analyzed for their K-Ar and Rb-Sr age to test for an eolian versus pedogenic origin of the mica. K-Ar and Rb-Sr apparent ages are approximately 100 times greater than the age of volcanism on the island. In addition Sr-87/Sr-86 values for mica-bearing soils are as high as 0.7273 and contrast greatly with the nonradiogenic strontium in Hawaiian lavas (0.703 to 0.707). These measurements show that the potassium- and strontium-bearing minerals of the Hawaiian soils are not of local origin and confirm the importance of eolian transport of mica and clays to the North Pacific. (Knapp-USGS)

EFFECT OF EXCESS MOISTURE ON TRACE ELEMENT DISTRIBUTION IN SOILS OF LININGRAD OBLAST (O VLIYANII IZBYTOCHNOGO UVLAZHNENIYA NA RASPREDELENIYE MICKROELEMENTOV V POCHVAKH LENINGRADSKOY OBLASTI),
Liningrad State Univ. (USSR).
L. L. Dvornikova.
Vestnik Leningradskogo Universiteta, No 6, Seriya Geologiya-Geografiya, No 1, p 78-86, March 1973. 5 tab, 7 ref.

Descriptors: *Soils, *Soil moisture, *Excess water(Soils), *Trace elements, *Geochemistry, Copper, Cobalt, Nickel, Manganese, Boron, Soil profiles.
Identifiers: *USSR(Leningrad Oblast).

Relation of the behavior of mobile forms of trace elements Cu, Co, Ni, Mn, and B to degree of soil wetting was investigated in soil profiles taken on a plowland in the northern part of the Ordovikskoye Plateau in Leningrad Oblast. Studies were conducted on plowed soils formed on calcareous and leached moraine loam and on meadow and forest soils developed under similar natural conditions. The effect of excess moisture on trace element content and distribution throughout the profile is most pronounced in Sod- and Peat-Gley soils. In excessively wet Sod-Podzolic soils nickel accumulates throughout the entire profile, while copper accumulates in the lower gleyed horizons. Changes in Mn, Co, and B concentrations are poorly expressed. Trace elements in Sod-Calcareous soils generally react weakly to periodic excess wetting. (Josefson-USGS)

CONTENT AND COMPOSITION OF ORGANIC MATTER IN SOD PODZOLIC AND SOD SANDY SOILS OF DIFFERENT DEGREES OF WETTING, (IN RUSSIAN),
L. V. Drechina.
Vestn Beloruss Univ 2.2. p 77-82, 1970.
Identifiers: Coniferous forests, Forests, Fulvic-acid, Humic-acid, Humification, Meadow, Nitrogen, *Organic matter, Plowland, *Podzolic soil, *Sandy soil, Sod soils, Wetting.

The composition of organic matter in light-textured soils of different degrees of wetting under coniferous forests, meadow and plowland, is described. The process of humification in forest soils proceeds mainly with the production of fulvic acids. With the progressive increase of wetting, the ratio of humic acid to fulvic acid (Ch:Cf) increases regularly in forest and meadow soils. The concentration of N in soils and in individual groups of organic matter was determined.--Copyright 1973, Biological Abstracts, Inc.
W74-05237

THE POSSIBILITY OF SODA FORMATION IN SOIL BY BIOCHEMICAL MEANS, (IN RUSSIAN),
P. A. Kerzum, S. I. Vasil'chikova, R. G. Gorbunova, and A. F. Zakharchenko.
Dokl Akad Nauk Tadzh SSR. Vol 15, No 9, p 54-56. 1972.
Identifiers: Biochemical processes, *Calcium carbonate, Soda formation, *Soil chemistry, *Calcium sulfate.

Under laboratory conditions, an experiment was conducted to establish meadow conditions with sub-surface waters and organic materials. It was possible, through a series of reactions, to decrease the CaCO3 level while the CaSO4 level increased in the separated horizons of oxidated soil zones.--Copyright 1973, Biological Abstracts, Inc.

PROBLEMS OF THE ORGANIC MATTER OF ORGANOGENIC SOILS, (IN RUSSIAN),
S. G. Skoropnaov, and V. S. Brezgunov.
Dokl Akad S-Kh Nauk 12. p 20-22. 1972. Illus.
Identifiers: Crop rotation, Drainage, Grain, Grass, Meadow, *Organic matter, *Organogenic soils, *Peat bogs, Reclamation, *Soils, Water storage.

In the reclamation and the agricultural use of organogenic soils (peat bogs), losses of organic matter and transformations of the quality of the organic matter occur. Under certain conditions both factors are undesirable, since the water-storage capacity of the soils decreases. The soil-forming process occurring under the effect of reclamation must be regulated by an optimal degree of draining and by the character of soil use. This is achieved by using the soils for meadow cultivation lowering the groundwater in conformity with the requirements of meadow grasses. The soils may also be used for grain crops-meadow grass rotation.--Copyright 1973, Biological Abstracts, Inc.

HYDRIC REGIME OF AN ARGIUDOL (IN SPANISH),
Universidad Nacional de Tucuman (Argentina).
R. B. Zuccardi, G. S. Fadda, and M. R. Caceres.
Rev Agron Noroeste Argent, Vol 9, No 2, p 347-365, 1972, Illus, English summary.
Identifiers: *Argiudol, *Hydric regime, *Soil moisture.

With slight variations, the period of soil drying starts in May and ends in Oct. In Nov.-April the soil reconstitutes its hydric reserves. These periods coincide in general with the periods of negative and positive hydric balance calculated after Thornthwaite. Small hydric reserves are registered in Oct. The soil normally reaches its highest hydric content in the 50 cm on top in Feb. Hydric contents lower than the wilting point are registered between Sept. and mid-Nov. Moisture contents are high in the surface horizons in Dec.-March.--Copyright 1973, Biological Abstracts, Inc.

INVESTIGATIONS ON THE TRANSFER OF BIOELEMENTS FROM ORGANIC MATTER TO SOIL SOLUTION IN THE HUMUS LAYER OF A BEECH STAND (IN GERMAN),
R. Mayer.
Z Pflanzenernaehr Bodenkd, Vol 131, No 3, p 261-273, 1972, Illus, English summary.
Identifiers: Beech, Bioelements, *Humus layers, Leaf, Organic matter, *Soil solution, *Seepage, *Canopy drip, *Input-output analysis, Lysimeters.

Monthly and annual fluxes of bioelements were measured at 2 levels: at the soil surface (= input) and at the lower boundary of the humus layer (= output) by determination of amount and concentration of the precipitation (canopy drip), of the litter and of the seepage. Seepage was collected with funnel lysimeters. By comparison of both fluxes (input-output-analysis) for some bioelements, mathematical equations could be derived which describe the transfer of these elements from organic matter to soil solution. The results are explained as consequence of the different bonds of the elements in leaf tissues and in humus substances.--Copyright 1973, Biological Abstracts, Inc.

SOIL-WATER-POTENTIALS DEPENDING ON TEMPERATURE, (IN GERMAN),
Technische Universitaet, Hanover (West Germany). Institut fuer Bodenkunde.
J. Richter.
Z Pflanzenernaehr Bodenkd. Vol 131, No 3, p 254-261. 1972. Illus. (English summary).
Identifiers: *Hysteresis, *Soil water potentials, *Temperature, Clay, Sand.

The soil-water potential of different soils was measured. At -200,000 and -700,000 erg/cc all soils showed a significant dependence of the soil-water potential on temperature in connection with hysteresis phenomena. With soils rich in clay or sand the dependence was most pronounced. At very high suction values (< -700,000 erg/cc erg cm -3) the dependence became small. The measurements agreed well with psychrometric evaluations of Campbell and Gardner on the no-temperature-dependence of the soil-water potential in the range of about -3,000,000 to 20,000,000 erg/cc.--Copyright 1973, Biological Abstracts, Inc.

TOXICITY OF SOD PODZOLIC SOILS LYSIMETRIC SOLUTIONS, (IN RUSSIAN),
G. N. Marshunova.
Byull Vses Nauchno-Issled Inst S-Kh Mikdrobiol. Vol 14, No 3, p 88-92. 1970.
Identifiers: *Fertilizers, Lysimetric solutions, Microorganism, *Sod podzolic soils, Soils, *Toxicity(Yeast), Hydrogen ion concentration.

The toxicity of lysimetric solutions from all horizons of sod podzolic soils was greater in March than in April. Toxicity was expressed in percent destruction of epiphytic yeasts in 24 hr. Insignificant fluctuations in the pH of the soil solutions led to differences in toxicity. The number of microorganisms was higher in April than in March in all horizons. Data are reported on the effect of fertilizers upon the concentration of microorganisms and the toxicity for plants of soil and lysimet-

ric solutions. The toxic substances may be washed out or partially adsorbed in different horizons. The toxicity of aqueous soil extracts is usually weaker than that of lysimetric solutions.--Copyright 1973, Biological Abstracts, Inc.

2I. Water In Plants

REDESCRIPTION OF MAPPATES PLATAXUS RANGNEKAR (COPEPODA: CALIGIDAE),
Kerala Univ., Trivandrum (India). Dept. of Aquatic Biology and Fisheries.
M. S. Hameed, and N. K. Pillai.
Hydrobiologia, Vol 42, No 4, p 403-411, September 28, 1973. 18 fig, 15 ref.

Descriptors: *Copepods, *Systematics.
Identifiers: *Mappates platexus, Anurites, Pseudanuretes, Heniocophilus, Eirgos, Animal morphology.

A detailed description of Mappates plataxus is presented. In the light of the present study it is suggested that the closely allied genera Auretes, Pseudanuretes, Heniochophilus, Mappates, and Eirgos do not show any valid generic difference. The suggestion that they may be considered as subgenera under the genus Anuretes is put forth. (Mortland-Battelle)

TAXONOMY, DISTRIBUTION AND ECOLOGY OF THE GENUS SESARMA (CRUSTACEA, DECAPODA, GRAPSIDAE) IN EASTERN NORTH AMERICA, WITH SPECIAL REFERENCE TO FLORIDA,
Smithsonian Tropical Research Inst., Balboa, Canal Zone.
L. G. Abele.
The American Midland Naturalist, Vol 90, No 2, p 375-386, October 1973. 1 fig, 2 tab, 12 ref.

Descriptors: *Systematics, Ecology, *Ecological distribution, Habitats, Crustaceans, Speciation, Spatial distribution, *Crabs, Invertebrates, *Florida, North America, Marine animals.
Identifiers: *Shore crabs, *Sesarma, Animal morphology, Macroinvertebrates, Driftline crab, Sesarma (Holometopus) cinereum, Sesarma (Holometopus) ricordi, Sesarma (Holometopus) benedicti, Sesarma (Holometopus) miersii, Sesarma (Sesarma) reticulatum, Sesarma (Sesarma) curacaoense, Decapods.

Six species of the grapsid crab genus Sesarma are reported from eatern North America. A key for their identification is presented and their diagnostic characters are illustrated. Their distributions in the western Atlantic are reviewed and a map is given of their distributions in Florida, an area where all six species occur. Field observations on the biology and ecology of four species are presented. Character divergence occurs between two closely related, partially sympatric species. Several factors are suggested to account for the observed patterns of distribution. (Holoman-Battelle)
W74-04880

PHYTOMASS RESERVES IN SOME TYPES OF TUNDRA FROM THE NORTHERN OB RIVER RELATED AREA, (IN RUSSIAN),
Akademiya Nauk SSSR, Sverdlovsk. Inst. of Plant and Animal Ecology.
G. V. Trotsenko.
Ekologiya. Vol 3, No 5, p 90-93. 1972.
Identifiers: Phenology, *Phytomass reserves(Trees), Rivers, *Tundra, *USSR(Ob River), *Tree types(Root systems).

Phytomass reserves were determined in tree types of tundra near the Ob river (USSR). Aboveground and root systems were measured and the phytomass determined. The beginning of August was the peak of agreement with data of phenological studies. There was less reserve in the shoot than in the root system.--Copyright 1973, Biological Abstracts, Inc.

ALTITUDINAL VARIATION OF CHLOROPHYLL CONCENTRATION AND REFLECTANCE OF THE BARK OF POPULUS TREMULOIDES,
New Mexico Univ., Albuquerque. Dept. of Biology.
W. W. Covington.
Available from the National Technical Information Service as PB-228 873, $4.75 in paper copy, $1.45 in microfiche. M Sc Thesis, 1972. 32 p, 4 fig, 3 tab, 22 ref. OWRR A-039-NMEX(1).

Descriptors: *Photosynthesis, *Bark, *New Mexico, *Reflection, Deciduous trees, Forests, Elevation, Altitude, Ecosystems, *Chlorophyll, Trees, Plant tissues, Plant pigments, Deciduous forests, Mountain forests, Plant physiology, *Cottonwoods.
Identifiers: Quaking aspen, *Populus tremuloides, Corticular photosynthesis, Corticular chlorophyll.

Chlorophyll concentration and reflectance of bark samples of Populus tremuloides Michx. growing at various elevations in the Sangre de Cristo mountain range of New Mexico indicate that the appearance of greener barked trees at higher elevations is due to the reflectance characteristics of a bloom of dead periderm cells and not to increased chlorophyll concentrations. Chlorophyll concentrations in aspen bark were, in fact, inversely correlated with altitude. The higher concentration of chlorophyll at lower elevations is effectively masked by a white bloom which is also characteristic of exposed site trees. At higher elevations the bloom is yellow-brown and more translucent thus allowing the chlorophyll layers beneath to show through. Therefore, trees at higher elevations appear greener even though they have lower corticular chlorophyll concentrations. The ecological significance of altitudinal variations in chlorophyll concentrations and reflectance of aspen bark is discussed. (Creel-New Mexico)
W74-04977

THE RELATIONSHIP OF SOIL TEMPERATURE AND CYTOKININ PRODUCTION IN ASPEN INVASION,
New Mexico Univ., Albuquerque. Dept. of Biology.
K. R. Williams.
Available from the National Technical Information Service as PB-228 870, $5.25 in paper copy, $1.45 in microfiche. M Sc Thesis, 1972. 39 p, 5 fig, 2 tab, 33 ref. OWRR A-039-NMEX(2).

Descriptors: *New Mexico, *Soil temperature, *Reproduction, *Invasion, Soil analysis, Temperature, Root development, Deciduous trees, Forests, Trees, Deciduous forests, Mountain forests, Soil moisture, Soil-water-plant relationships, Vegetation regrowth, *Cottonwoods, Regression analysis.
Identifiers: *Cytokinin, *Aspen invasion, Populus tremuloides, Quaking Aspen, Thermal regulation, Sprouting.

Quaking aspen (Populus tremuloides Michx.) primarily reproduce by suckering (i.e., root sprouting). Numerous environmental variables have been suggested as causes of this phenomenon, the most notable of which is soil temperature. Studies demonstrating thermal regulation of sprouting indicate the involvement of growth hormones. The only class of hormones to elicit a response similar to sprouting is the cytokinins. Other hormones, no doubt, function in this process as well (e.g., auxins). To substantiate the idea that thermal regulation of sprouting is primarily a function of thermal regulation of cytokinin activity, and to determine the importance of other environmental factors in this scheme, various measurements of field conditions and several laboratory experiments were employed. Regression analyses results indicated that in this subalpine meadow, 91.9% of the variation in soil moisture was accounted for by the silt percentage, and 66% of the variation in soil temperatures was accounted for by soil moisture. Significant relationships exist between numbers of sprouts invading the meadow and soil temperature at each position. Laboratory experiments showed that there exist 'cause-effect' type relationships between soil temperature, cytokinin levels, and sprout production of root sections, and when no factor is severely limiting, sprouting and generally aspen invasion is primarily a thermally controlled process. Thermal control is accomplished through alteration of cytokinin activity levels. (Creel-New Mexico)

INFLUENCE OF SOIL WATER LOGGING DURING SPRING, FOLLOWED BY SUMMER DRYNESS, ON THE BEHAVIOR OF YOUNG PLANTS OF NORWAY SPRUCE, (IN FRENCH),
G. Levy.
Ann Sci For. Vol 28, No 4, p 403-423. 1971. (English summary).
Identifiers: Dryness, Growth, Height, Mortality, Nutrition, Plants, Rooting, *Soil water, Spring, *Spruce(Norway), Summer, Waterlogging.

A greenhouse experiment was conducted using large pots filled with pseudogley soil (A1 and A2)

horizons. There were 4 spring treatments (soil at field capacity, level of water table 7, 14 or 21 cm below the soil surface) and 3 summer treatments (soil at field capacity, watered once a month, watered twice a month) giving a combination of 12 treatments. Data were recorded on highest growth, rooting, mortality and nutrition. A shallow water table in spring followed by severe summer drought was the most unfavorable. All waterlogged roots dried but regrowth took place in summer.--Copyright 1973, Biological Abstracts, Inc.

THE PROBLEM OF THE MICROCLIMATE OF THE DRY PINE FOREST, (IN RUSSIAN),
B. M. Kavalyauskas, and I. S. Tomkus.
Liet Tse Modsiu Akad Darb Ser B. 2, p 237-244. 1970. (English summary.).
Identifiers: Air humidity, *Climates, Dry forest, *Pine forests, Radiation, Temperature, Velocity, Winds, *USSR(Lithuania).

Results of the actinometric and gradient meteorological observations in 1968 in a dry pine forest and on an open field in southern Lithuania, USSR, are presented. Only 41% of the total incoming solar radiation reached the forest floor under the pine canopy. The ratio of diffused radiation to the total radiation was 39% in the field, and 50% under the canopy. The average values of the daily totals of radiation balance were 81% lower than in the open field due to the difference in the amount received and the characteristics of the forest floor surface. Data on the temperature of the ground surface and of the air at the height of 0.2 and 1.5 m and the relative humidity of the air showed that the differences between the forest and the field were unimportant. Differences of meteorological data obtained in different weather conditions were important: after rain periods it was colder in the forests than in the field. This was due to difference in wind velocity and in the value of the turbulence coefficient, as well as in the expenditure of heat in warming up the soil.--Copyright 1973, Biological Abstracts, Inc.
W74-05350

AN EXAMPLE OF LONGEVITY OF PINE ON A PEAT BOG, (IN RUSSIAN),
V. G. Rubtsov.
Lesovedenie. 6. p 104-107, 1970. (English summary).
Identifiers: Bogs, Drainage, Morphology, *Peat bog, *Pine longevity, Sphagnum.

Studies were conducted in a 230-yr-old shrub-Sphagnum pine forest. The geomorphological structure of the bog is characterized by drainage and a comparatively high trophic value of the peat. It differs from similar bogs which are confined to the watersheds and hillocky dunes, where the trophic value of peat is low. Shrub-Sphagnum pine forests react differently to drainage depending on the geomorphological structure of forest transitional bogs.--Copyright 1973, Biological Abstracts, Inc.
W74-05351

CONTRIBUTION TO THE METHOD FOR THE DETERMINATION OF SUBLETHAL WATER DEFICIT,
P. Weinberger, M. Romero, and M. Oliva.
Flora (Jena), Vol 161, No 5/6, p 555-561, 1972, Illus, English summary.
Identifiers: Methods, *Sublethal limit, *Water deficit, *Saturation.

The sublethal water deficit is a highly variable feature. By a common statistical procedure, determination of the correlation between water deficit and reachable re-saturation, it is possible to establish a specific value of each species, this value being easily reproducible. This corresponds to a re-saturation of only 90% of the initial maximum value.--Copyright 1973, Biological Abstracts, Inc.

STOMATAL RESPONSES TO CHANGES IN TEMPERATURE AT INCREASING WATER STRESS,
Wuerzburg Univ. (West Germany). Botanisches Institut II.
E. D. Schulze, O. L. Lange, L. Kappen, U. Buschbom, and M. Evenari.
Planta (Berl), Vol 110, No 1, p 29-42, 1973, Illus.
Identifiers: Artemisia-herba-alba, Hammada-scoparia, Humidity, *Israel(Negev), Prunus-armeniaca, Reaumuria-negevensis, *Stomatal response, *Temperature, Water stress, Zygophyllum-dumosum, Transpiration(Plants).

The response of stomata to a gradual increase in temperature at increasing plant water stress was studied in a hot desert habitat (Negev, Israel) in the field, but under controlled temperature and humidity conditions. Four native species (Zygophyllum dumosum, Artemisia herba-alba, Hammada scoparia, Reaumuria negevensis) and 1 cultivated plant (Prunus armeniaca) were used in these studies. The stomatal response to temperature was compared with the response in well-irrigated plants of the same species. At low water stress, the diffusion resistance for water vapor decreased in response to a gradual increase in temperature. Transpiration increased accordingly. This response was reversible. All species responded in the same way. The opening of stomata with increasing temperature was apparently independent of the stomatal response regulated by atmosphere humidity. At high plant water stress, the stomatal response was reversed, i.e., the stomata closed when temperature was gradually increased. This stomatal closure was also independent of the closure regulated by atmospheric humidity. The plant water potential at which the stomatal response to temperature was reversed differed among the species investigated.--Copyright 1973, Biological Abstracts, Inc.
W74-05366

CONTRIBUTION TO KNOWLEDGE OF MAYFLIES OF THE AMUR BASIN: I. IMAGINES (EPHEMEROPTERA:EPHEMERELLIDAE), (IN RUSSIAN),
O. Ya. Baikova.
Izv Tikhookean Nauchno-Issled Inst Rybn Khoz Okeanogr. 77. p 178-206. 1972.
Identifiers: *Ephemerella, Ephemerellidae, Ephemeroptera, Imagines, *Mayflies, *USSR(Amur basin), *Insects, Invertebrates.

For the first time a description is presented of the imaginal forms of 4 spp. of the genus Ephemerella previously known only on the basis of larvae; supplements to the descriptions of imagines are given for other species. The data on the relationship of the segments of the tarsus, tibia and femur of mayflies of the investigated genus and quantitative indices characterizing the size and weight of winged individuals are presented. Information on some aspects of the biology of the species is given. (See also W74-05381)--Copyright 1973, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

ACKER LAKE LANDSLIDE, MONROE COUN TY, MISSISSIPPI,
Geological Survey, Jackson, Miss.
D. M. Keady, E. E. Russell, and T. J. Laswell.
Available from the National Technical Informa tion Service as PB-228 697 $4.25 in paper copy $1.45 in microfiche. Information Series MGS-73-1 1973. 22 p, 13 fig, 11 ref. OWRR A-058-MISS(2).

Descriptors: *Landslides, *Mass wasting *Mississippi, Joints(Geologic), Frac tures(Geologic), Permeability, Stream erosion Loess, Clays, *Erosion.
Identifiers: *Tombigbee River(Miss.), *Acke Lake(Miss.).

Mass wasting in the Tombigbee Sand Member of the Eutaw Formation (Upper Cretaceous) is a common occurrence on steep bluffs in northeast ern Mississippi. The most recent documented slide occurred on Monday, April 27, 1970, in the vicinity of the small manmade Acker Lake, approximately five miles north of Aberdeen. The 1970 Acker Lake landslide was not the result of a single factor, but was influenced by several variables. Bluffs along the western valley wall of the Tombigbee River are kept steep in the area of Acker Lake principally by the fact that the present channel of the river is against the west valley wall in the immediate area. Acker Lake furnishes a continuing supply of water thus maintaining a high moisture content, with accompanying weight increase in permeable beds. This high moisture content probably increases pore pressure and decreases shearing strength in the sands. Heavy rainfall during March and April of 1970 brought an increase in stream energy thus enabling the Tombigbee River to remove material from the base of slides formed at an earlier period. A continuous clay bed at depth provided a surface along which initial lateral movement could occur. Joints in

Tombigbee Sand, prominent along the bluff face, probably provided passageway for more rapid movement of water than would have otherwise occurred. The conditions that led to the 1970 slide are essentially unchanged, therefore continued sliding of this type is likely. (Knapp-USGS)

SOME MODERN APPROACHES TO BEACH STUDIES,
Woods Hole Oceanographic Institution, Mass.
J. M. Zeigler.
Oceanography and Marine Biology, Annual Review, H. Barnes (Editor), Vol 2, p 77-95, 1964. 3 fig, 3 tab, 60 ref.

Descriptors: Coasts, *Beaches, *Waves(Water), *Sediment transport, Geography, *Currents(Water), Reviews, Equations, Rip currents.
Identifiers: *Wind generated waves, *Longshore currents, *Tidal currents, Solitary waves, Nearshore.

Following a historical approach to beach studies, various physical concepts in the study of beach processes are examined. Modern observations are discussed in terms of water movements. Equations which relate to water movement or qualitative expressions concerning the behavior of water become part of the problem under study, and measurement of the variables in these equations forms the basis for most modern field experiments. Also discussed are concepts concerned with the transport of material. The importance of treating the variables synoptically and, in the field, geographically as well is emphasized. (Sinha - OEIS)

PRECISE CONTROL OF WAVE RUN-UP IN BEACH RIDGE CONSTRUCTION,
Florida State Univ., Tallahassee. Dept. of Geology.
W. F. Tanner, and F. W. Stapor.
Zeitschrift fuer Geomorphologie N. F., Vol 16, No 4, p 393-399, December 1972. 1 fig, 6 ref, 1 photo.

Descriptors: *Beaches, Slopes, Sands, Berms, Sediments, Tides, Waves(Water).
Identifiers: *Wave energy, *Beach ridges, Washover, Tidal range, *Wave run-up, Swash zone.

Beach ridge growth is essentially the work of wave run-up in the swash zone, with little or no washover effects. An approximate method is provided whereby wave height can be estimated from beach ridges. Under given sediment supply and wave conditions, run-up distance and beach face slope are rigidly related. This relationship is such that, with constant wave energy and no tidal change, the waves reach the top of the beach, neither more nor less. If deposition of sand is taking place on the beach, a small berm may be deposited in the upper part of the run-up range. Under constant conditions of deposition, this berm will grow upward and seaward into a beach ridge, having almost all of its internal bedding dipping toward the sea. Highly energetic waves will reach the top of the ridge, but there will be little wash-over. Addition of variability of waves and tide provides only that construction take place in the upper part of the tidal range, under higher-than-average wave energy levels. Elimination of the supply of excess sand puts an end to construction. (Sinha-OEIS)

SOME THREE-DIMENSIONAL EFFECTS IN SURF,
Brown Univ., Providence, R.I. Div. of Applied Mathematics.
R. B. Turner, and R. E. Meyer.
Available from NTIS as AD-605 662 for $6.00 paper copy, $1.45 microfiche. Technical Report No. 6, August 1964. 16 p, 1 fig, 4 ref. Nonr 562(34).

Descriptors: *Surf, *Water(Waves), *Shallow water, *Beaches, Equations.

Asymptotic equations are presented of surf on shallow beaches with a geometry causing longshore variations in the water motion. In general, such surf is found to be governed by the three-dimensional, nonlinear shallow-water equations. However, when the seabed profile parallel to shore is shallower than the profile normal to shore, the asymptotic equations are shown to differ only in minor respects from those of two-dimensional surf. Such 'weakly three-dimensional' surf can be analysed directly in terms of the results of the two-dimensional theory. (Sinha-OEIS)

CAUSE AND PREDICTION OF BEACH EROSION,
National Weather Service, Garden City, N.Y. Eastern Region.
S. E. Wasserman, and D. B. Gilhousen.
Technical Memorandum NWS ER-55, November 1973. 11 p, 3 fig, 1 tab, 5 ref.

Descriptors: *Beach erosion, Oceanography, Meteorology, *Littoral drift, *Sediment transport, Sands, Atmospheric pressure, Fetch, Tides, New York, New Jersey.
Identifiers: Long Island(NY), *Wind-driven currents, *Longshore currents.

Oceanographic and meteorological factors involved in beach erosion can be isolated. Surface wind and pressure conditions associated with known beach erosion cases have been presented, and products operationally available to assist in predicting these conditions have been itemized. It is not known how often beach erosion does not occur when the wind and pressure conditions are favorable. Shifting sands, which continuously change near the coastal underwater topography, and tide conditions play an important role in controlling the beach erosion process. While hurricanes and tropical storms do cause major damage along the beaches, they are not considered in this study. The most damaging beach erosion is caused by a fetch directed along the coastline with an onshore component. The wind-driven steep waves stir up the sand and fine gravel and tend to eat away at the beaches. Then a longshore current, or 'littoral drift' is required to transport the loosened sand, if the erosion process is to continue. High tides, that are necessary for the erosion process to penetrate inland above the normal beach line, can be due to storm surges, lessening atmospheric pressure on the adjacent ocean surface, or the direction of the longshore current, in addition to the normal astronomical tides. COASTAL MOVABLE BED SCALE MODEL TECHNOLOGY,
Tetra Tech, Inc., Pasadena, Calif.
L-N. Fan, and B. Le Mehaute.
Final Report Tetra Tech No TC-131, prepared for Army Coastal Engineering Research Center, June 1969. 122 p, 20 fig, 9 tab, 68 ref, 2 append. DACW72-68-C-0020.

Descriptors: *Sediment transport, *Coasts, *Waves(Water), *Model studies, Coasts, Data processing.
Identifiers: Littoral transport, Similitude relationships, Scale effects.

The historical development, applications, limitations and basic requirements of coastal movable bed model technology are reviewed. Similitude relationships are established based upon important parameters governing coastal sediment transport. Relationships proposed by previous investigators are critically reviewed. Four basic scale ratios, namely, horizontal scale, vertical scale (or distortion), sediment size and specific weight can be determined from established similitude relationships. Possible scale effects are analyzed. A standard procedure is recommended. This procedure includes data acquisition, data correlation, choice of scales and artificial sediments, preliminary wave tank experiments, adjustment of the model, determination of time scale of bed evolution, interpretation of results and scale effects. A formula is suggested for estimating the time scale of bed evolution due to littoral transport by waves. These results should be useful in both evaluating and utilizing the movable bed model as a tool in coastal engineering problems. (Sinha-OEIS)

THE INTERNAL VELOCITY FIELD IN BREAKING WAVES,
Chicago Univ., Ill. Dept. of Geophysical Sciences.
R. L. Miller, and J. M. Zeigler.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 7, p 103-122, 1964. 9 fig, 27 ref.

Descriptors: *Waves(Water), *Tidal effects, Shores, Coasts, *Shallow water, Shoals, *Sediment transport.
Identifiers: *Breaking waves, *Shoaling, Nearshore processes, Velocity field patterns, Breakers.

The results presented are the first detailed measurements of the horizontal velocity component inside breaking waves. The field study was originally undertaken in 1960 to determine the presence and strength of mid-depthreturn flow under shoaling waves. In the course of the experiment, a series of measurements was made very close to the shore. During one tidal cycle, the instruments became exposed to breakers, and continued to operate. A study of the resulting data showed that detailed velocity measurements could be made within the natural breaker in the field. Accordingly, a series of runs was made and velocity data collected on breakers ranging from very small to storm size. The results very strongly suggest that different breaker shapes have different internal velocity fields. It is possible that the initiation of instability and the subsequent development of the breaker may be characterized by one or several vortex systems, as suggested by the velocity field patterns. The breakers studied were of the type that break directly on the shore and include within the sequence , the runup and backwash from the foreshore. (Sinha - OEIS)

SEASONAL CHANGES IN BEACHES OF THE NORTH ATLANTIC COAST OF THE UNITED STATES,
Army Coastal Engineering Research Center, Washington, D. C.
J. M. Darling.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 15, p 236-248, 1964. 8 fig, 5 tab, 4 ref.

Descriptors: *Beach erosion, *Seasonal, Erosion, Deposition(Sediments), *Tides, New Jersey, New York, Rhode Island, *Waves(Water), Coasts, Storms.
Identifiers: Nearshore processes, Wave period, Wave steepness.

Seasonal changes of eight Atlantic Ocean beaches along the East Coast of the United States from southern New Jersey to Rhode Island have been under study since September 1962. Changes in the beach profiles to date indicate variations on a seasonal basis. Analysis of surveys made at Atlantic City covering a period of little more than one year, indicate marked seasonal differences in beach conditions. The waves during the erosion periods were characteristically of greater steepness than those of the accretion period. The seasonal trend inferred from data for Atlantic City seems to prevail in varying degrees at all the beaches under study, with the possible exception of those fronting on Long Island Sound rather than the Atlantic Ocean. It must be recognized that the actual erosion or accretion does not occur as a continuous pattern, but there are periods which are dominated either by erosion or accretion. These seasonal trends are then the net or resultant behavior pattern. (Sinha - OEIS)

WAVE ENERGY AND LITTORAL TRANSPORT,
Laboratorio Nacional de Engenharia Civil, Lisbon (Portugal).
J. Castanho.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 17, p 259-266, 1964. 3 fig, 1 ref.

Descriptors: Bores, *Waves(Water), *Littoral drift, *Sediment transport, Coasts, Energy.
Identifiers: *Wave energy, *Breaking waves.

In this discussion of wave energy and littoral transport, the following aspects are considered: energy dissipated by friction losses; energy contained in the longshore current; and energy dissipated by breaking waves. The momentum method is used in calculating the mean velocity of the longshore current. Energy fractions dissipated in friction losses, breaking losses and solid discharge are also calculated. (Sinha - OEIS)

QUANTITATIVE RESEARCH ON LITTORAL DRIFT IN FIELD AND LABORATORY,
Florida Univ., Gainesville. Coastal Engineering Lab.
P. Bruun, and J. Purpura.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 18, p 267-288, 1964. 11 fig, 2 tab, 25 ref.

Descriptors: *Florida, *Littoral drift, *Sediment transport, Shear stress, Bed load, *Waves(Water), *Currents(Water).

A combined field and laboratory research program is underway to gain quantitative information on littoral drift longshore as well as perpendicular to the shore. The laboratory utilizes modern tracing techniques by luminophores including a scanning (counting of grains) machine and experiments in a wave tank where a current is passed through waters agitated by waves propagating parallel to or perpendicular to the current action. Modes of sediment transport examined are sheet layer movement and transverse movement. In the laboratory, studies have been made on transport by wave action, transport by wave and flow action (propagation unidirectional), and wave and current action operating under an angle with each other. (Sinha - OEIS)

SAND LOSSES FROM A COAST BY WIND ACTION,
California Univ., Berkeley. Coll. of Engineering.
J. W. Johnson, and A. A. Kadib.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 24, p 368-377, 1964. 3 fig, 6 tab, 6 ref.

Descriptors: *California, *Sediment transport, *Wind erosion, *Dunes, *Sands, Equations, *Beach erosion.

A procedure is outlined for the calculation of the annual rate of transport of sand that might be expected to be carried inland from a natural beach by wind action. The procedure involves the beach composition and alinement, the frequency of winds of various speeds from various directions, and a suitable formula to describe the transport. It is possible that the transport formula may be altered as a result of current research; however, the general procedure as outlined should apply. (Sinha - OEIS)
W74-04967

RESIDENCE TIME OF SAND COMPOSING THE BEACHES AND BARS OF OUTER CAPE COD,
Woods Hole Oceanographic Institution, Mass.
J. M. Zeigler, S. D. Tuttle, G. S. Giese, and H. J. Tasha.

In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 26, p 403-446, 1964. 6 fig, 3 tab, 8 ref.

Descriptors: *Sediment transport, *Beaches, *Sand bars, *Erosion, Deposition(Sediments), *Massachusetts.
Identifiers: *Cape Cod(Mass), Residence time.

Residence time is defined as the average number of years a grain of eroded sediment is likely to spend in a specific area before it is transported elsewhere. Sediment seems to take a preferred path, some of it moving along the beach and some along the bars. The time scale is limited to the past seventy years, the time for which data were available. The geographical position is limited to a strip of the east coast of Cape Cod extending seaward to where water depth is about forty feet. The method used to compute residence time involves volume stability. In as much as there is neither gain nor loss of the average volume of sand built features, sand must be moving out of the study area at the same rate it is being introduced. Therefore, the residence time in years is the average volume of a beach or bar divided by the yearly volume of sediment added by erosion to the beach or bar. The east coast of Cape Cod is uniquely situated for a study such as this because sediment is introduced into the definition area only by erosion within the area of the cliffs or sea floor. No sediment or very little of it is introduced into the study area by means of littoral drift. (Sinha - OEIS)
W74-04968

THE ASH WEDNESDAY EAST COAST STORM, MARCH 5-8, 1962. A HINDCAST OF EVENTS, CAUSES, AND EFFECTS,
National Engineering Science Co., Washington, D. C.
C. L. Bretschneider.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 41, p 617-659, 1964. 28 fig, 1 tab, 31 ref.

Descriptors: *Storms, *Winds, *Waves(Water), *Tides, Coasts, Calibrations, *Storm surges, *Beaches, Dunes, Data.
Identifiers: Hindcasts, Gusts.

The material presented represents a hindcast of events during the March 6-8, 1962, storm along the east coast of the United States. Specifically the hindcasts include (1) deep water waves, waves over the continental shelf, waves in shallow water, and waves at the coastline; (2) total tide, including normal predicted tide, storm surge and wave setup; (3) wave run-up on the beach and an estimation of beach berm and dune erosion; (4) wind speeds over water, over the beach, and over the top of the dunes. The hindcasts were checked with available data for the storm. Numerous sources of information on the storm were available to improve the accuracy of the 'state of the art' in forecasting. The so-called 'calibrated methods' for hindcasting were quite suitable for the present storm conditions. (Sinha - OEIS)

Descriptors: Coasts, *Beaches, *Scour, Regression analyses, *Waves(Water), *Shallow water, *Sea walls.
Identifiers: Seawall beaches, Standing waves, Beach scour, Wave action.

The processes were investigated involved in the formation of beach scour, caused by wave action, on a natural beach and a seawall beach. Studies also took into account the determination of the reflection coefficient which characterized the wave reflected from both the seawall and the deformed beach profile. The standing wave, formed by the reflection of the waves, was found to be important in the analysis of beach scour phenomena. For the calculation of the reflection coefficient, two methods were used: the envelope method and the Coastal Engineering Research Center (CERC) method. The results showed excellent agreement. The linear standing wave theory was compared with the second order standing wave theory. The wave surface profile and the corresponding horizontal and vertical velocity components of the water particles at the designated points on the free water surface were calculated on the basis of the two theories. The results indicate that the linear standing wave theory gives good results as a first approximation.

To predict the scour depth on the natural beach and the seawall beach, regression analyses were performed. The results gave excellent correlation. (Sinha - OEIS)

WAVE PROPAGATION IN CONTINUOUS RANDOM MEDIA,
California Univ., Los Angeles. Dept. of Mathematics.
C. G. Lange.
Available from NTIS as AD-768 197, price $3.00 in paper copy, microfiche $1.45. Report, 1970. 32 p, 8 ref. ONR Contract N000-14-69-A-0200-4022.

Descriptors: *Waves(Water), Energy, *Stochastic processes, Mathematical studies, Statistics, *Gravity waves, Equations.
Identifiers: Wave propagation, Bottom topography, Random media.

The way in which small random inhomogeneities in a transmission medium affect the statistical properties of a system of waves was studied. Provided the spectral cumulants are sufficiently smooth at some initial time, a sequence of closures for the zeroth order spectral functions can be deduced which describe asymptotically the transfer of energy between wave numbers. Of particular importance is the fact that the closure equations are derived without the need to resort to ad hoc statistical assumptions. The general theory is applied to the problem of the propagation of water waves over an irregular bottom topography. (Sinha - OEIS)

SEDIMENTARY PROCESSES ON THE CONTINENTAL SLOPE OFF NEW ENGLAND,
Woods Hole Oceanographic Institution, Mass.
J. C. MacIlvaine.
NTIS as AD-768 284, $5.50 in paper copy. Technical Report No. WHOI-73-58, September 1973. 211 p, 51 fig, 4 tab, 64 ref. ONR Contract N00014-66-C0241.

Descriptors: New England, Massachusetts, *Sedimentation, *Continental slope, *Sediment transport, Geomorphology, *Turbidity currents, Creep, Hydrodynamics, Biology.
Identifiers: Cape Cod(Mass), Bottom currents, Quaternary, Oceanographic data, Gravitational processes, Slumping.

A small area of the continental slope south of Cape Cod, Massachusetts was studied. Gravitational processes (slumping, creep, and turbidity currents) are apparently the most effective erosional processes. Massive large-scale failure occurs where the slope steepens from a gradient of 1.5 deg to 7.6 deg, producing scarps hundreds of meters in relief. Smaller scale slumping occurs on the other parts of the continental slope. Material removed by slumping is emplaced at the foot of the continental slope as intact and disrupted blocks 1 to 100 m thick. Turbidity currents generated by slumping have apparently eroded V-shaped gullies in the lower continental slope. Bottom currents are most influential at the shelf break, where they produce sorting of surface sediments and suspension of fine material by erosion of the bottom. Laboratory flume experiments and observations of the bottom indicate that the sediments of most of the continental slope are not normally affected by bottom currents. Biological activity causes both roughening and smoothing of the sediment surface. Tracking of the bottom produces small-scale roughness, and reworking of the bottom reduces larger roughness elements. Biological production of fibrous structures help render the the sediment surface extremely resistant to erosion by bottom currents. (Sinha - OEIS)

INFLUENCE OF PARENT MATERIAL AND SLOPE EXPOSURE ON PROPERTIES OF SOILS RELATED TO ERODIBILITY IN NORTH CENTRAL ANATOLIA,
Forstliche Forschungsanstalt, Munich (West Germany). Institut fuer Bodenkunde.
A. N. Balci.
Z Pflanzenernaeh Bodenkd, Vol 131, No 1, p 42-45, 1972.
Identifiers: Clay, Gravel, *Organic matter, *Slope erosion, Soils, *Turkey(Anatolia), *Soil erosion.

The soils developed from 4 different parent materials in the study area were highly erodible. Parent material has strong influence on soil properties related to erodibility. Dispersion ratio as an index of erodibility and various other soil properties in relation to 4 different parent materials were found to be significantly different. The relative differences in inherent potential erodibility of soils developed from various parent materials may be ranked on the basis of dispersion ratio as follows: Neocene silt greater than Sandstone greater than Andesite greater than Conglomerate. The soils developed on southern slopes were found to be significantly more erodible than those on northern slopes. The relatively better soil stability on northern slopes may be attributed to the significantly higher contents of organic matter and clay fraction. Organic matter contents of surface soil layers (0-15 cm) were found to be significantly higher than those of subsurface (15-30 cm) soil layers. This relation was reserved for gravel content and particle density. Organic matter, gravel, and clay contents of soils showed highly significant inverse associations with dispersion ratio whereas electrical conductivity and silt content indicated significant positive correlation with the erodibility. Several useful relations were found between dispersion ratio and various other soil properties and the results are presented.--Copyright 1973, Biological Abstracts, Inc.

EXPERIMENTAL STUDY OF RIVER INCISION,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
R. G. Shepherd, and S. A. Schumm.
Geological Society of American Bulletin, Vol 85, No 2, p 257-268, February 1974. 20 fig, 3 tab, 29 ref. NSF Grant GA-27726.

Descriptors: *Erosion, *Stream erosion, *Channel erosion, Hydraulic models, Scour, Channel morphology, Flumes.
Identifiers: River incision.

River incision was studied in simulated bedrock, a mixture of sand and kaolinite. Slope, sediment feed, and water discharge were controlled during the development of four channels. After an increase of slope at constant discharge, the following sequence of erosion occurred: (1) development of longitudinal lineations, ripples, and potholes; (2) enlargement of the lineations into prominent grooves; (3) coalescence of the grooves into a single, narrow, and deep inner channel. The inner channel was incised below base level and a sequence of bedrock lows and highs formed. Bedrock scour lows had a weakly regular spacing during incision and a randomly clustered spacing following aggradation. Incision around stabilized alternate bars in a sinuous sand-bed channel resulted in destruction of the bars and maximum scour where the flow was locally constricted. In an initially sinuous bedrock channel, scour depth was greater at bends than at crossings. Provided all of the available sediment load was entrained, the bed was eroded more at convex banks of bends than at concave banks. However, after deposition occurred, the maximum erosion shifted to the concave bank. These results indicate that lateral or vertical incision at bends of incised meandering streams is controlled by the amount of available sediment load entrained by channel-forming discharges. Incised meanders superposed from an earlier pattern on a peneplain should rarely occur in nature, if epeirogenic tilting caused the incision. (Knapp-USGS)

WHAT FUTURE FOR NIAGARA FALLS,
Cornell Univ., Ithaca, N.Y. Dept. of Geological Sciences.
S. S. Philbrick.
Geological Society of American Bulletin, Vol 85, No 1, p 91-98, January 1974. 2 fig, 18 ref, append.

Descriptors: *Erosion, *Waterfalls, *New York, Gradients(Streams), Stream erosion, Geomorphology, Thalweg.
Identifiers: *Niagara River, *Niagara Falls.

The future recession of Niagara Falls up the thalweg of Niagara River is described. The fastest rate of recession occurs in the notched configuration when rock bursts result from high stresses in the rock, as they did several times during the nineteenth century. Conversely, the slowest rate of erosion is during the stable arch configuration such as has prevailed during the first three quarters of the twentieth century. Upstream migration of the Horseshoe Falls will lower the level of the Chippawa-Grass Island Pool below the bottom of the American Channel and unwater the American Falls. The level of Lake Erie may be lowered a few feet at this time. Because the top of the Lockport Formation dips beneath the surface and the Salina rocks appear, the upper part of the valley will cease to be a dolomite cliff and will become a much flatter-sloped outcrop of the less resistant Salina rocks. As the falls recede upstream, the continued upstream dip of the strata will lower the base of the Salina and increase the height of the Salina exposure to produce a distinctly broader, flatter gorge quite different in appearance from the Lockport Gorge. The Final Falls will be much lower than the preceding Horseshoes and may be so slow in recession as to be a quasi-stationary falls, without immediate change in the level of Lake Erie. (Knapp-USGS)

EFFECT OF AN EXCEPTIONAL STORM ON SOIL CONSERVATION AT SAMARU, NIGERIA,
Institute for Agricultural Research, Zaria (Nigeria).
J. Kowal.
Samaru Res Bull. 141, p 163-173. 1972.
Identifiers: Cultivation, *Nigeria(Samaru), Ridges, Runoff, *Soil conservation, *Storms(Severe), Corn(Field), *Erosion control.

An exceptionally heavy storm over the Samaru catchment basin was unevenly distributed. Rainfall ranged from about 6 to 2 inches over a distance of several miles. The peak intensity of the storm reached 11.4 inches/hr with intensities of between 4.7 and 8.5 inches/hour maintained for 25 min. The average rainfall received by the catchment basin was 2.8 inches of which 44% was accepted causing a rise in the water-table of about 14 inches. The remaining 1.6 inches were lost in run-off, about 80% of which drained in 12 hr. A cultivated bench terrace on a uniform slope of 1:320, 200 yards long and with a catchment area of about 0.3 acre, supporting maize on 3-foot ridges gave the highest run-off (57%), while from terraces planted with maize without ridges under similar conditions of slope and catchment area the run-off rate was only 29% to 44% of the rainfall. Soil conservation measures at Samaru farm were effective in rapidly removing a high volume of run-off and in preventing flooding without damage to the main watercourses. The storm considerably reduced the size of ridges often undermining the plant support and causing lodging of certain crops. On the few non-ridged terraces, no excessive erosion was observed and there was no lodging of crops. The safe spacing of graded terraces against rill erosion was tentatively assessed to be an interval of 180 ft at 1.4% slope. The merits of ridges and flat cultivation with and without effective soil conservation measures are discussed. With adequate soil conservation such as that afforded by graded or bench terraces, flat cultivation has many advantages over ridging under mechanized farming.--Copyright 1973, Biological Abstracts, Inc.

PREDICTION OF THE START OF EROSION IN THE LIGHT OF PRINCIPLES OF RELIABILITY THEORY, (IN RUSSIAN),
Ts. E. Mirtskhulava.
Dokl Adad S-Kh Nauk. 12, p 39-41. 1972.
Identifiers: *Erosion, *Model studies, *Prediction, River, Silt, Suspension, *Reliability theory.

The method proposed for predicting the start of erosion with the use of the principles of reliability is imperfect, but it led to the construction of a sufficiently simple model for estimating this important stage of erosion. The value of the study consists not so much in results obtained as in the proof of the possibilities opened by the principles of reliability theory for solving many analogous problems governed by stochastic parameters and overshoots of random functions (suspension, deposition and transport of silt, deformations of river beds, etc.).--Copyright 1973, Biological Abstracts, Inc.

RESULTS OF A SECOND STUDY OF WIND-ERODED SOILS IN THE PAVLODAR PRIIRTYSHYE (IN RUSSIAN),
E. D. Kuzmina.
Biol Nauki, Vol 15, No 10, p 117-121, 1972.
Identifiers: Clays, Sand, Silt, Soils, USSR, Winds, *Soil erosion, *Erosion control, *USSR(Pavlodar Priirtyshye), *Soil treatment.

Results from a 5-yr follow up experiment showed a 10-fold decrease in soil erosion due to application of certain soil protection measures--the increase of sand and clay and the decrease of small or fine sand and coarse silt. Other important factors responsible for controlling erosion were an increase in humus, moisture and annual cultivation of the soil.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *USSR(Moldavia), Mineralization.

Fluoride concentrations in alkaline waters of the Moldavian artesian basin are extremely high, reaching 20 mg/liter in waters of Riphean-Eocambrian rocks and 13.5 mg/liter in waters of Silurian, Cretaceous, and Lower Sarmatian rocks. On the basis of its high rate of migration in alkaline waters of the basin, fluoride belongs to the category of very mobile and readily mobile elements. A relation is established between groundwater mineralization and fluoride content. Maximum fluoride concentrations correspond to a mineralization of 2-5 g/liter for waters of sedimentary rocks and 1-2 g/liter for waters of metamorphic rocks. With a further increase in mineralization, the amount of fluoride in groundwater decreases sharply. The chemical composition of groundwater has a positive effect on the leaching of fluoride from rocks and on fluoride migration. An increase in Na2CO3 and NaHCO3 concentrations results in a higher fluoride content in groundwater and intensifies fluoride migration; an increase in CaCO3 content retards fluoride migration. A change in pH, Eh, and water temperature has little effect on the fluoride concentration in groundwater of the Moldavian artesian basin. (Josefson-USGS)

GRADIENT TITRATION-A NOVEL APPROACH TO CONTINUOUS MONITORING USING ION-SELECTIVE ELECTRODES,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
B. Fleet, and A. Y. W. Ho.
Analytical Chemistry, Vol 46, No 1, p 9-11, January 1974. 5 fig, 1 tab, 16 ref.

Descriptors: *Volumetric analysis, *Aqueous solutions, *Automation, Methodology, Monitoring, Flow rates, Sulfides, Ions, Automatic control, Chemical analysis, Pollutant identification.
Identifiers: *Ion selective electrodes, *Continuous monitoring, *Gradient titration, Reagents, Sulfied electrodes, Membrane electrodes, Accurary, Endpoint sensors.

A new approach to the automation of titration processes using ion-selective electrodes is described. Based on the gradient titration principle, the method involves the semicontinuous monitoring of a sample stream with a reagent stream where the concentration of the latter increases linearly in the form of a gradient. The flow rates of both sample and reagent streams are maintained constant, and a suitable ion-selective electrode monitors the approach to the equivalence point. The method is, in principle, the constant volume analog of conventional titrimetry. The results obtained for the determination of sulfide ion using mercuric nitrate as gradient reagent and a sulfide membrane electrode are presented. The initial study has shown that the gradient titration technique is experimentally feasible when an appropriate ion-selective electrode with a rapid response is available as the end-point sensor. No sophisticated potential measuring device is required; simple, inexpensive operational amplifier modules can be used for the potential readout. The procedure as described is not fully automatic, however, with part of the sample (and reagent titrant) handling step being done manually. Full automation, however, is possible by incorporating a modified Technicon Sampler into the system. (Holoman-Battelle)
W74-05303

INVESTIGATION OF THE FACTORS AFFECTING THE RESPONSE TIME OF A CALCIUM SELECTIVE LIQUID MEMBRANE ELECTRODE,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
B. Fleet, T. H. Ryan, and M. J. D. Brand.
Analytical Chemistry, Vol 46, No 1, p 12-15, January 1974. 4 fig, 3 tab, 40 ref.

Descriptors: Effects, Calcium, Cations, Selectivity, Lead, Magnesium, Strontium, Zinc, Cadmium, Copper, Sodium, Hydrogen, *Electrodes.
Identifiers: *Liquid membrane electrodes, *Calcium electrodes, *Ionic interference, Response time, Data interpretation, Ion selective electrodes, Ion activity, Barium.

Measurements on the response time of a Calcium Selective Liquid Membrane Electrode are reported and a new parameter t sub 95 is proposed as being a more representative measure of electrode performance than the more widely used t sub 1/2. The former value is of more importance in assessing the performance of an electrode in real analytical situations. The effect of various interfering ionic species on the response time of the electrode is investigated and ions tested have been divided into three groups according to their effect on the response time. An interpretation of this division is proposed on the basis of the kinetics of the reaction of the interferent ion with the membrane site species and conventional selectivity ratios. It has been shown that a calcium liquid membrane electrode responds rapidly and reproducibly to step changes in calcium ion activity, with response time of the order of a few seconds. Also interfering ions can have a marked effect on the electrode response time and this cannot always be predicted from a knowledge of the selectivity constant. Where the selectivity constant is very small, it may be assumed that no effect on response time will be observed. For interfering ions with moderate to large selectivity constants, an increase in electrode response time will be observed when the kinetics of the interferent ion reactions become rate limiting. THE EFFECTS OF HURRICANE CAMILLE ON THE MARSHES OF THE MISSISSIPPI RIVER DELTA,
Louisiana State Univ., Baton Rouge. School of Forestry and Wildlife Management.
R. H. Chabreck, and A. W. Palmisano.
Ecology, Vol 54, No 5, p 1118-1123, Late Summer 1973. 1 fig, 3 tab, 18 ref.

Descriptors: *Hurricanes, *Freshwater marshes, Aquatic plants, *Salt marshes, *Marine plants, *Environmental effects, Soil chemistry, Water chemistry, Mississippi River, Deltas, Water sampling, Marsh plants, Coastal marshes, Water analysis, Soil analysis, Brackish water, Organic matter, Alligatorweed, Floating plants, Willow trees, Water hyacinth, Vegetation, Amphibious plants, Rooted aquatic plants, Widgeon grass.
Identifiers: *Mississippi River Delta, Recovery, Macrophytes, Organic carbon, Phragmites communis, Myriophyllum spicatum, Alternanthera philoxeroides, Lemna minor, Eichhornia crassipes, Duckweed, Reed grass, Distichles spicata, Scirpus robustus, Spartina patens, Salix nigra, Balck willow, Bulrush, Species abundance, Vetch, Aster, Water hyssop, Southern swamplilly, Water pennywort, Common frog-fruit, Narrow-leaved cattail, Great duckweed, Chicken spike, Smooth cordgrass, Big cordgrass, Saltmeadow cordgrass, Goldenrod.

The active delta of the Mississippi River was sampled in August 1968 to determine plant species composition, plant coverage, and soil and water chemistry. Hurricane Camille struck this area in August 1969, with winds in excess of 200 km/h and tides ranging upward to 5.2 m above MSL. The delta was resampled 2 weeks following the hurricane to evaluate the immediate effects on vegetation, soil, and water, and again 1 year after the hurricane to determine the recovery rate of vegetation. The hurricane resulted in a drastic reduction of vegetation. Regrowth was rapid in the delta marshes and after 1 year plant coverage approached pre-hurricane levels of abundance; however, recovery was slower in ponds and lakes. The loss of vegetation was mainly a result of the sweeping action of wind and water, and plants were either uprooted or ripped apart and carried away by the current. Water salinity increased with the hurricane but declined by the following year and appeared to have only slight effect on marsh vegetation. Plant species varied in their response to the hurricane. Bacopa monnieri showed practically no effect, and Phragmites communis and Spartina alterniflora were reduced only slightly. Myriophyllum spicatum, Panicum repens, and Alternanthera philoxeroides were greatly reduced by the storm; and after 1 year, only Alternanthera philoxeroides showed significant recovery. W74-04926

EFFECT OF WAVE ACTION ON TIDAL STAGES ALONG THE COAST OF FLORIDA, MARCH 1962,
Army Engineer District, Jacksonville, Fla.
M. Lazarus, and C. L. Nowlin.
In: CERC Bulletin and Summary Report of Research Progress for Fiscal Years 1965-66, Vol II, p 1-10, 1965-66. 5 fig, 2 tab, 5 ref.

Descriptors: *Florida, *Storms, Wind tides, Tidal effects, *Atmospheric pressure, Energy, *Waves(Water), Coasts, Beaches.
Identifiers: United States East Coast, Swells, Wave action, Barometric pressure, Long-period waves.

The northeast storm of 5-9 March 1962 was one of the more severe storms which have battered the east coast of the United States in recent times. It caused very severe damage from Long Island to the Outer Banks of North Carolina and significant damage from Maine to Florida. The entire Florida coastline was affected by long-period swells, although it was far from the center of the storm and the winds which generated them. Unusually high tides which could not be attributed entirely to the effect of local winds were observed during this period. Some instances are discussed of observed tidal behavior where the departures from predicted values are attributed to the effect of long-period waves. Examination of tidal data from stations distributed along the Florida coast during this storm incident shows a definite increase in tidal stage due to energy absorbed from wave action - i.e., wave effect - rather than wind set-up or barometric pressure. (See also W74-04926) (Sinha - OEIS)

LONGSHORE CURRENTS AT NAGS HEAD, NORTH CAROLINA,
Army Coastal Engineering Research Center, Washington, D.C. Research Div.
C. J. Galvin, Jr., and R. P. Savage.
In: CERC Bulletin and Summary Report of Research Progress for Fiscal Years 1965-66, Vol II, p 11-29, 1965-66. 7 fig, 4 tab, 7 ref.

Descriptors: *North Carolina, *Beaches, *Slopes, *Currents(Water).
Identifiers: Outer banks(NC), *Longshore currents, *Breakers, Surf zone, Velocity measurement.

Longshore current velocity and associated wave and beach conditions were measured during 5 days in March 1964, along a beach on the Outer Banks of North Carolina. Velocity measurements, obtained by repeatedly timing the travel, over a 200-foot distance, of free-floating balloons filled with fresh water, did not indicate a pulsating flow for the longshore current during the time of measurement and over the distance traveled by the floats. Breaker angle, the variable most closely correlated with current velocity, was measured by Brunton compass, by triangulation on a buoy at the breaker line, and by measurement of the velocities of the crest and plunge point of the breaking wave. Wave height and wave period were measured from wave gage records and by visual estimation. Beach slopes beneath the surf zone, measured from profiles supplied by the Louisiana State University field station at Nags Head, varied from 0.026 to 0.030. In four of the five sets of data obtained, the measured velocity (1.3 to 4.3 feet per second) differed by 0.1 and 1.0 foot per second from that predicted by two very different equations for longshore current velocity. (See also W74-04926) (Sinha - OEIS)
W74-04928

A REVIEW OF ESTUARINE MODELING,
New York Univ., Bronx. Dept. of Meteorology and Oceanography.
J. E. Overland.
In: Proceedings 18th Annual Technical Meeting, Institute of Environmental Sciences, May 1972. p 178-185 (1972). 2 fig, 2 tab, 21 ref.

Descriptors: *Simulation analysis, *Model studies, Equations, Friction, Turbulence, *Estuaries, *Water quality, Hydrodynamics, *Reviews, Path of pollutants.

Some of the current hydrodynamic and water quality estuarine models and the physical assumptions associated with them are reviewed. Technically, there is a distinction between modeling and simulating a physical system. Simulation implies correlating a large amount of data for a curve of best fit and to use this functional dependence for prognostication. Modeling implies starting from basic physical principles and deducing the behavior of more complex processes. Representation of estuaries is usually a combination of both techniques; one usually proceeds as far as possible on physical grounds, but finally fits the model to the prototype by judicious choice of unknown parameters in the equations, usually those associated with friction or turbulence. NEARSHORE PROCESSES,
Scripps Institution of Oceanography, La Jolla, Calif.
D. L. Inman.
In: Encyclopedia of Science and Technology. McGraw-Hill Book Company, Inc., 1971. 8 p, 8 fig, 10 ref.

Descriptors: *Coasts, *Beaches, *Waves(Water), Reviews, *Sediment transport, *Currents(Water).
Identifiers: Surf zone, *Nearshore processes, Circulation cells, Biological effects, Longshore currents, Beach cusps.

The establishment and persistence of natural sand beaches are often the result of a delicate balance among a number of factors, and any changes, natural or man-made, tend to upset the equilibrium. Explanations are given on waves, currents in the surf-zone, the formation of circulation cells, beach types, beach cycles, beach cusps, the mechanics of beach formation, longshore movement of sand, and the source of beach sediments. The rigor of wave action and the continually shifting substrate make the sand beach a unique biological environment. Since the beach-forming processes and the trapping of material by currents and sand are much the same everywhere, the animals found on sand beaches throughout the world are similar in aspects and habits. SEA SURFACE TEMPERATURE AND SALINITY CONDITIONS IN 1969 AT AGATE BEACH AND YAQUINA BAY, OREGON,
Oregon State Univ., Corvallis. Dept. of Oceanography.
J. J. Gonor, and A. B. Thum.
Available from NTIS as AD-703 662 for $6.00 paper copy, $1.45 microfiche. Data Report No. 39, prepared for Office of Naval Research, Reference 70-1, February 1970. 24 p, 1 fig, 3 tab. N00014-67-A-0369-0001.

Descriptors: *Oregon, Coasts, *Temperature, *Salinity, *Upwelling, Tides, *Seasonal, *Estuaries.
Identifiers: Agate Beach(OR), Yaquina Bay(OR), Sea surface temperature.

Daily temperature and salinity conditions measured in the surf at Agate Beach, Oregon are summarized by 15 day periods for 1968 and 1969. For each period the number of observations, the high, the low, the mean and the standard deviation of the temperature and salinity measurements are tabulated. Daily data for 1969, derived from afternoon measurements are also given. A map indicating the stations is included, and the data are briefly discussed with the differences between the two years emphasized. The late occurrence of upwelling in 1969 accounts for the major differences between the two years. A water surface temperature station approximately 3 miles inside the mouth of Yaquina Bay was maintained in 1968 and 1969 by use of continuously recording thermographs. Daily data are given, starting in April, 1968, of surface temperature at higher high, lower low, lower high, and higher low waters. The influence of the state of the tide on bay temperatures, as well as that of other seasonal hydrographic phenomena are evident in the tabulations. (Sinha-OEIS)

DIFFUSION EXPERIMENTS IN COASTAL WATERS USING DYE TECHNIQUES,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
T. Ichiye.
In: Symposium on Diffusion in Oceans and Fresh Waters, Lamont Geological Observatory, Palisades, New York, Aug/Sept 1964. T. Ichiye (editor), p 54-67, December 1965. 4 fig, 18 ref. AEC-AT(30-1)2663, Nonr 266(48).

Descriptors: Dyes, Tracers, *Diffusion, Coasts, *New Jersey.
Identifiers: Shearing currents, Bahama Banks, Long Island, Langmuir circulation, Ekman spiral, *Wind current, *Drift current, *Eddy viscosity.

The data obtained from dye experiments off New Jersey coast, on the Bahama Banks and south of Long Island since 1961 are analyzed. The areas of a visually demarcated dye patch are determined from concentration measured with fluorometers and compared with the mean square separation of a two-particle theory of diffusion, yielding t(2) and t(3) law for small and large time t respectively. Elongation of dye patches is interpreted as vertically differential advection due to a shearing current. Striations are discussed as caused by helical vortices which may be also a cause of Langmuir circulation. The curvature of the tail part of a dye patch is attributed to the Ekman spiral in a pure wind current, because, in most cases, curved tails were observed for moderate winds and in waters deeper than 20 m and because the curvature is clockwise from head to tail in the northern hemisphere. A modified theory of a drift current with eddy viscosity decreasing exponentially with depth is developed and compared with patterns of dye patches. (Sinha-OEIS)
W74-04938

COASTAL CIRCULATION NEAR KAKINADA BAY DURING MONSOON PERIOD,
Andhra Univ., Waltair (India). Dept. of Meteorology and Oceanography.
R. Ramanadham, B. S. Reddy, and K. R. G. K. Murty.
Pure and Applied Geophysics, Vol 89, p 183-191, 1971. 6 fig, 1 tab, 3 ref.

Descriptors: Bays, Coasts, *Waves(Water), *Currents(Water), *Tides, *Monsoons, *Circulation, Sea breezes, Land breezes, Sand bars, Geomorphology.
Identifiers: *India(Kakinada Bay), Bay of Bengal.

An intensive study was made of currents in the coastal vicinity of Kakinada Bay and Godavari Point on the east coast of India. The circulation has high variability in both magnitude and direction related to the three current components namely wind currents, tidal currents and wave currents. The circulation pattern rapidly changes with the change in the phase of the tide and local winds of land and sea breeze. The littoral currents directed up-coast during premonsoon and monsoon seasons have insignificant effect across the bay opening due to the sheltering effect of the sand bar. The study is helpful for understanding the geomorphological changes of the shoreline in this region. (Sinha-OEIS)
W74-04941

A STUDY ON MIXING AND CIRCULATION IN THE ST. LAWRENCE ESTUARY UP TO 1964,
Bedford Inst., Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
H. J. A. Neu.
AOL Report 1970-9, December 1970. 31 p, 21 fig, 7 ref.

Descriptors: *Estuaries, *St. Lawrence River, *Mixing, *Circulation, Salinity, Temperature, Ice.

The salinity and temperature distributions in the St. Lawrence Estuary during fresh water inflows in Feb. and in May of 1963 are reported and analyzed. The mixing character of the Estuary varied from being well mixed at the head to moderately mixed in the section below the head to Tadoussac. In the deep section below the mouth of the Saguenay River, stratified conditions prevailed. The water was appreciably fresher on the south side of the channel than on the north side except off the mouth of the Saguenay River. Progressing seaward, the depth of the fresh upper layer decreased along the north shore and increased along the south shore. Temperatures in the surface layer during Feb. were higher on the north side than on the south. In May, this trend was reversed. The primary motion in the system is a longitudinal two-layer circulation in which the surface layer deviates toward the south shore and the deep layer toward the north shore. There is a net seaward flow of lower-salinity water on the south side and a compensatory flow of higher-salinity water on the north side. The Gaspe Current is a high-velocity surface stream that forms below Tadoussac and grows seaward with the entrainment of the water from the rivers of the north shore. Upwelling of the deep warmer water to the surface maintains a nearly ice-free channel along the north shore through most of the ice season. The intensity of the estuarine circulation in the St. Lawrence Estuary is determined primarily by the quantity of fresh water entering the system. (Sinha-OEIS)

ESTUARY AND COASTLINE HYDRODYNAMICS.
Engineering Societies Monographs. McGraw-Hill Book Co., Inc., New York, 1966. 756 p. A. T. Ippen, editor.

Descriptors: *Estuaries, Coasts, *Hydrodynamics, *Beaches, *Shores, *Waves(Water), *Currents(Water), *Coastal engineering, Oceanography.

The fundamentals of water waves are logically and comprehensively developed to the point where practical problems become accessible to systematic interpretation by existing theory. The presentation is directed towards the needs of those working with coastal engineering problems. Limiting boundary conditions are emphasized while general mathematical developments are limited to those essential to understand the significance of the results. COASTAL PROCESSES,
California Univ., Berkeley. Dept. of Civil Engineering.
J. W. Johnson, and P. S. Eagleson.
In: Estuary and Coastline Hydrodynamics. Engineering Societies Monographs. McGraw-Hill Book Co., Inc., Chap 9, p 404-492, 1966. 46 fig, 4 tab, 76 ref.

Descriptors: Coasts, *Beaches, Sediments, *Sediment transport, Beach erosion, Equilibrium, *Coastal structures, *Ocean currents, *Tidal effects, Wind, Rip currents, Profiles, Particle size, *Harbors, *Littoral, Breakwaters, Shore protection, Reviews.
Identifiers: Nearshore processes, Tidal currents, Longshore currents, Wave induced currents, Breaking waves, Sand by passing.

A review is presented of the state of knowledge of coastal processes. The review is presented under the following headings: sources and characteristics of beach material; modes of transport and losses of material; quantitative analysis of transport processes; characteristics of beach deposits; characteristics of the equilibrium beach; and sediment problems at coastal structures. (See also W74-04950) (Sinha - OEIS)

TIDAL DYNAMICS IN ESTUARIES. PART I: ESTUARIES OF RECTANGULAR SECTION,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
A. T. Ippen.
In: Estuary and Coastline Hydrodynamics. Engineering Societies Monographs. McGraw-Hill Book Co., Inc. Chap 10, Part 1, p 493-522, 1966. 9 fig, 2 tab, 22 ref.

Descriptors: *Friction, *Sedimentation, Diffusion, *Tidal effects, *Estuaries, Coasts, Reviews.
Identifiers: *Cooscillating tides.

This review is limited to the development of understanding of those processes of tidal flows in estuaries which are of primary importance in dealing with diffusion and sedimentation problems. The subject is reviewed under the following headings: general review of engineering problems in tidal estuaries; general characteristics of estuaries; mathematic description of tides without friction and tides with friction; and experimental results on cooscillating tides. (See also W74-04950) (Sinha - OEIS)
W74-04952

TIDAL DYNAMICS IN ESTUARIES. PART II: REAL ESTUARIES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
D. R. F. Harleman.
In: Estuary and Coastline Hydrodynamics. Engineering Societies Monographs. McGraw-Hill Book Co., Inc. Chap 10, Part 2, p 522-545, 1966. 8 fig, 3 tab, 19 ref.

Descriptors: *Estuaries, *Friction, *Tidal effects, *Equations of motion, Coasts, Reviews.
Identifiers: Tidal wave propagation, *Cooscillating tides, *Harmonic analysis.

Analysis of tidal motion in real estuaries necessarily involves a degree of approximation, since it is never possible to specify boundary conditions by exact analytical expressions. For relatively narrow estuaries it is generally permissible to neglect the effect of the earth's rotation; however, it is rarely possible to ignore the effect of friction on tidal wave propagation in real estuaries. The subjects reviewed are physical concepts of tidal motion in estuaries; methods of analysis; numerical integration methods; harmonic method; damped cooscillating tide; and Delaware Estuary. W74-04953

SALINITY INTRUSION IN ESTUARIES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
A. T. Ippen.
In: Estuary and Coastline Hydrodynamics. Engineering Societies Monographs. McGraw-Hill Book Co., Inc. Chap 13, p 598-629, 1966. 12 fig, 3 tab, 18 ref.

Descriptors: *Estuaries, *Salinity, *Tidal effects, Gravity, Fresh water, Mixing, Diffusion, *Coasts.
Identifiers: *Salinity intrusion, *Tidal prism.

The flow regime in estuaries is governed by four distinct dynamic influences, which determine the direction and magnitude of velocities at different elevations and at different distances from the mouth. The primary dynamic factors listed in order of their importance for the flow are as follows: (a) the effect of the tide throughout the salinity intrusion length as a function of the forcing tide at the entrance; (b) the effect of gravitational forces due to density variations between fresh water from upland sources and saline water entering from the sea; (c) the gravitational forces needed to produce a net seaward transport of fresh water; and (d) the Coriolis forces and centrifugal forces inducing transverse fluid motion due to rotation of the earth and due to the curvature of the estuary channel, respectively. W74-04954

SEDIMENTATION IN ESTUARIES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
A. T. Ippen.
In: Estuary and Coastline Hydrodynamics, Engineering Societies Monographs. McGraw-Hill Book Co., Inc. Chap 15, p 648-672, 1966. 6 fig, 1 tab, 22 ref.

Descriptors: *Estuaries, *Sedimentation, *Sediment transport, *Diffusion, Shoals, Sediment load, Flocculation, Sands, Mud - water interface, Hydraulic transportation, Flow.

Following a review of the state of knowledge of factors related to estuarine sedimentation, summaries are presented of the properties of estuarine sediments; the interaction of sediment and water flow; and diffusion characteristics and sedimentation in real estuaries. Specific aspects considered are: general flow phenomena; bed load and its source; properties and sources of mud; shoaling; flocculation; transport of granular sediments; flow of water-mud mixtures; differences in hydraulic transport between granular and flocculating materials; and consequences of human activities. W74-04955

FIELD EXPERIENCE IN ESTUARIES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
H. B. Simmons.
In: Estuary and Coastline Hydrodynamics. Engineering Societies Monographs. McGraw-Hill Book Co., Inc. Chap 16, p 673-690, 1966.

Descriptors: *Estuaries, *Sediment transport, Dredging, Navigation channels, Tidal effects, Salinity, *Mixing, *Sedimentation, *Coasts, *Currents(Water).
Identifiers: Shoaling, *Tidal currents.

This review of field experience in estuaries discusses: tidal currents, their origin, effects of tidal range, effects of diurnal inequality in tides, and phase relationships between tide and currents; salinity generated currents; estuary mixing types; sedimentation in estuaries; sedimentation in navigation slips; and dredging and spoiling practices in estuaries. (See also W74-04950) (Sinha - OEIS)
W74-04956

MODEL LAWS FOR COASTAL AND ESTUARINE MODELS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. H. Keulegan.
In: Estuary and Coastline Hydrodynamics, Engineering Societies Monographs. McGraw-Hill Book Co., Inc. Chap 17, p 691-710, 1966. 11 ref.

Descriptors: *Estuaries, *Mixing, *Model studies, Density, Dimensional analysis, *Salinity, *Rivers, Flow, *Diffusion.
Identifiers: Similarity.

Model laws for coastal and estuarine models are reviewed. Subjects discussed are: dynamical approach to similarity; dimensional analysis for density flow; method of differential equations; necessity of distortion; models of unsalinated rivers; models of mixed estuaries; and mixed approaches to models. (See also W74-04950) (Sinha - OEIS)
W74-04957

TIDAL AND SALINITY MODEL PRACTICE,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
H. B. Simmons.
In: Estuary and Coastline Hydrodynamics. Engineering Societies Monographs. McGraw-Hill Book Co., Inc. Chap 18, p 711-731, 1966. 12 fig.

Descriptors: *Estuaries, *Model studies, *Tides, *Salinity, Diffusion, Hurricanes, Storms, New Jersey, South Carolina, Louisiana, Texas, Rhode Island.
Identifiers: Absecon Inlet(NJ), Charleston Harbor(SC), Vermilion Bay(LA), Delaware Estuary, Matagorda Bay(TX), Narrogansett Bay(RI), *Salt water intrusion, Flushing.

What estuary models are like and what they can and cannot contribute to the solution of estuarine problemsis discussed, rather than the technical aspects of model construction, instrumentation, and operation. The hydraulic estuary model is an engineering and scientific tool which, in the hands of those well versed in its use and in the interpretation of model test data, can contribute greatly to the solution of complex problems. The hydraulic estuary model should not be looked upon as a substitute for field and analytical studies but rather as an aid in such studies by contributing information which cannot be obtained accurately by other means. As demonstrated by specific examples, hydraulic models of estuaries are extremely useful tools in studies leading to a more complete understanding of estuarine phenomena, as well as for predicting the effects of proposed physical and other changes in estuaries on the hydraulic, salinity, shoaling, and flushing characteristics of these complex systems. However, such model studies must still be classified as art rather than science, and for this reason estuary models should be entrusted to those who have experience in the field and are thoroughly familiar with the uses and limitations of the models involved. W74-04958

CNOIDAL WAVES IN SHALLOW WATER,
Texas Univ., Austin. Dept. of Civil Engineering.
F. D. Masch.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 1, p 1-22, 1964. 7 fig, 25 ref.

Descriptors: *Shallow water, *Waves(Water), Energy.
Identifiers: *Cnoidal waves, *Wave transformations, Shoaling, Power transmission, Long waves.

The propagation of long waves of finite amplitude in water with depth to wavelength ratios less than about one-tenth and greater than about one-fiftieth can be described by cnoidal wave theory. To date little use has been made of the theory because of the difficulties involved in practical application. The theory necessary for predicting the transforming characteristics of long waves based on cnoidal theory is presented. Basically the method involves calculating the power transmission for a wave train in shallow water from cnoidal theory and equating this to the deep water power transmission assuming no reflections or loss of energy as the waves move into shoaling water. The equations for wave power have been programmed for the range of cnoidal waves, and the results are plotted in non-dimensional form. (Sinha - OEIS)
W74-04959

THE COASTLINE OF RIVER-DELTAS,
Rijkswaterstaat-Deltadienst, The Hague (Netherlands). Coastal Research Dept.
W. T. J. N. P. Bakker, and T. Edelman.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 13, p 199-218, 1964. 10 fig, 1 tab, 4 ref.

Descriptors: Coasts, Mathematics, *Waves(Water), *Rivers, *Deltas, *Sediment transport, *Shallow water.
Identifiers: Coastal configuration.

The purpose is to investigate the shape of the coastline of a river delta on a coast, along which sediment is transported by waves only. In order to make the problem suitable to a mathematical treatment it is necessary to simplify to a large extent the processes occurring in nature. Instability along the circular part of the delta (all other parts are always stable) probably means, that 'spits' occur. The shape of spits is not dealt with. If the quantity of river sediment exceeds a certain amount, the delta becomes partly unstable and erosion on the lee side of the delta begins; the delta grows so large, that is acting as a partly circular 'groin' with erosion on its lee side and accretion on the weather side. (Sinha - OEIS)
W74-04961

THEORETICAL FORMS OF SHORELINES,
Rijkswaterstaat-Deltadienst, The Hague (Netherlands). Coastal Research Dept.
W. Grijm.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers. Chap 14, p 219-235, 1964. 13 fig.

Descriptors: *Shores, *Waves(Water), Bays, Coasts, *Sediment transport.
Identifiers: *Shoreline configuration, Littoral transport, Capes, Cusps, *Wave action, Nearshore.

Theoretical studies suggest that maximum littoral transport takes place when waves approach shore obliquely. Discussed is the question of the type of shoreline to be expected when the littoral transport is ruled by the function sin 2 alpha when alpha equals 45 degrees and alpha represents the angle between the wave front and the shoreline. Shoreline configuration is theoretically expected to vary as the angle of approach varies. Correspondence between configuration and angle of approach is illustrated. When littoral transport is at a maximum cusp formation takes place. (Sinha - OEIS)
W74-04962

QUASI-WEEKLY AND DAILY PROFILE CHANGES ON A DISTINCTIVE SAND BEACH,
Naval Postgraduate School, Monterey, Calif.
J. D. Rohrbough, J. E. Koehr, and W. C. Thompson.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 16, p 249-258, 1964. 4 fig, 9 ref.

Descriptors: *California, *Beaches, *Refraction(Water waves), Profiles, *Sediment transport, Intertidal areas, *Bays, Coasts, *Shallow water.
Identifiers: *Monterey Bay(Calif), Nearshore processes, Onshore-offshore transport, Daily variations.

Del Monte Beach, because of its sheltered location in Monterey Bay, California, provides a natural laboratory for the study of beach profile changes and other nearshore phenomena by virtue of the relative simplicity of the natural conditions that prevail there. Extreme wave refraction results in a prevalence of swell of low height and breaker angle, but having a wide range of period. Coastal currents, tidal currents, and meteorological tides are negligible. There is no significant net littoral drift, accordingly, changes in the beach profile appear to involve only onshore-offshore transport of sand grains. A breaker-height gradient occurs along the beach, so that two beach profiles were established. Gradients also occur along the beach in sand texture, beach slope, and beach curvature. The two profiles, restricted to the intertidal zone, were measured quasi-weekly and then daily over a period of nine months. The changes in sand level at both were quite similar in magnitude in spite of the wave height gradient along the beach. No clear-cut seasonal cycle and no fortnightly spring-neap tidal cycle was detected in the data. The concurrent nature of the daily variations of both sand level and waves recorded immediately off the beach leave no doubt that changing wave conditions were the primary cause of the changes observed in Del Monte Beach, even though no clear-cut relationship between the two factors was apparent. W74-04964

NUMERICAL PREDICTION ON TYPHOON TIDE IN TOKYO BAY,
Central Research Inst. of Electric Power Industry, Tokyo (Japan).
T. Ito, M. Hino, J. Watanabe, and K. Hino.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 43, p 686-712, 1964. 15 fig, 9 ref.

Descriptors: Hurricanes, *Typhoons, *Storm surges, *Dikes, *Tides, *Forecasting, *Bays, Coasts, Equations, Winds, Coastal structures.
Identifiers: *Japan(Tokyo Bay), Prediction.

Mathematical problems on the numerical calculation of storm surges are discussed. The partial differential equations of motion adopted take into account the Coriolis force and the non-linear terms such as the inertial terms and a quadratic form of bottom friction. As a result, special care must be taken in order to obtain stable forms of finite-difference equations. Inadequate forms accumulate errors to cause divergence of the step by step calculations. A set of stable forms of the finite-difference equations of motion and continuity has been derived. Japan coasts are frequently damaged by severe storm surges (Typhoon Tides). To protect the metropolitan area from storm surges, a proposal has been made to construct a dike across Tokyo Bay. A numerical calculation has been made by means of IBM 7090 to estimate for several opening widths of the proposed dike, its effects on the reduction of surges. Interactions between daily tides (astronomical tide) and surges are also discussed. (Sinha-OEIS)

POTENTIALS OF TIDAL POWER ON THE NORTH ATLANTIC COAST IN CANADA AND UNITED STATES,
Windsor Univ. (Ontario). Dept. of Civil Engineering.
J. T. Laba.
In: Proceedings of Ninth Conference on Coastal Engineering, Lisbon, Portugal, June 1964, American Society of Civil Engineers, Chap 49, p 832-857, 1964. 10 fig, 5 tab, 2 ref.

Descriptors: Canada, United States, Tides, *Powerplants, *Bays, Coasts, *Tidal powerplants, Tidal energy, Maine, *International waters.
Identifiers: *Power sources, Passamaquoddy Bay, New Brunswick(Canada), Shepody Bay, Cobscook Bay(ME).

The most suitable locations for erection of tidal power plants on the North Atlantic Coast are reviewed and classified in respect to the possible pool arrangement. The harnessing of the tides to produce power in various layouts is described. The output from two proposed tidal power projects, Passamaquoddy Bay and Shepody Bay are compared and some auxiliary power sources to supplement the varying output of tidal power are discussed. The tide producing forces and the effect of the coastline on the tide height is also briefly described. (Sinha-OEIS)
W74-04972

APPLICATION OF BOUNDARY-LAYER THEORY TO DISPERSION IN NON-STRATIFIED TWO-DIMENSIONAL ESTUARIES,
Nielsen Engineering and Research, Inc., Mountain View, Calif.
J. N. Nielsen, and G. D. Kuhn.
Available from the National Technical Information Service as PB-228 852, $9.25 in paper copy, $1.45 in microfiche. Technical Report NEAR TR 45, (1973). 117 p, 17 fig, 3 tab, 17 ref, 1 append. OWRR C-3189(No 3698) (1). 14-31-0001-3698.

Descriptors: *Estuaries, *Dispersion, *Turbulent boundary layers, Mixing, Stratification, Flow, *Water pollution sources, Momentum equation, Fluid friction, Open channel flow, Convection, *Diffusion, *Path of pollutants.

An analytical formula representing the law of the wall and the law of the wake of turbulent boundary-layer theory has been found to represent the vertical velocity profiles of both laboratory channels and field data from real estuaries. The formula is used in an integral boundary-layer calculation method to calculate the detailed time-dependent flow field of two-dimensional estuaries. For given tidal information, only the integrated continuity and momentum equations are necessary to calculate the two parameters of the formula. The unique solution is found to pass through one or more singular points between the ends of the estuary. An analytical expression for the concentration profile is derived based on an analogy between turbulent exchange of momentum and mass. Good comparisons between theory and experiment were obtained for the flow field of a laboratory flume. Examination of data for dispersion indicates that the dominant terms of the governing equations are not diffusive in nature but are convective.

LONGSHORE CURRENTS AND SEDIMENT MOTION IN THE COASTAL ZONE OF THE SEA OF AZOV,
Rostov-on-Don State Univ. (USSR).
V. A. Mamykina.
Fluid Mechanics--Soviet Research, Vol 2, No 5, p 166-170, September-October 1973. 2 fig, 3 ref. (Originally published in Gidromekhanika, No 18, p 42-46, 1972.)

Descriptors: *Currents(Water), *Sediment transport, *Deposition(Sediments), *Coasts, Shores, Sand spits, Sand bars, Waves(Water), Water circulation, Movement, Velocity, Winds, Slopes.
Identifiers: *USSR(Sea of Azov), *Longshore currents.

Longshore currents near Belosarayskaya sandspit on the northern shore of the Sea of Azov were investigated in July-August 1966-67 for their effects on sediment transport. Currents in the intermediate layer are most stable and depend little on changes in wind and bottom relief. Bottom-layer currents play an important role in erosion and sediment deposition in the coastal zone. Currents in the Belosarayskaya Bay are characterized by their low velocity--2 to 5 cm/sec. The tip of the bar (1 m from the surface, 2 m station depth, and 500 m from the water edge) is characterized by an extremely complex circulation. Sediment deposition results in the formation of underwater extensions of the bar which in time reach the surface. Prevailing bottom current velocity along the seacoast of the bar is 6-8 cm/sec at a distance of 300-500 m and 8-11 cm/sec at 1,000 m from shore, corresponding to wind speeds of 3-4 m/sec. With wind speeds of 5 m/sec or more, a current velocity of 17-20 cm/sec was observed. Maximum bottom current velocities of 30-32 cm/sec were noted after 8-12 m/sec storm squalls. Bottom deposits on the underwater slope of the Belosaraysk bar are composed of fine-grained sand (80%), whose movement begins with velocities of 8-11 cm/sec. At current velocities of 15-20 cm/sec, corresponding to yearly average wind speeds of 5 m/sec above the Sea of Azov, the transported material includes silt particles and fine- and medium-grade sand. Bottom velocities of 30-40 cm/sec suffice for transport of sediment of all fractions found on the coast and bottom of the Sea of Azov. (Josefson-USGS)
W74-05024

VARIATIONS IN THE HEIGHT OF WAVE RUN-UP ON A SANDY BEACH,
Akademiya Nauk URSR, Kiev. Inst. of Hydromechanics.
E. S. Tsaits, and V. V. Khomitskiy.
Fluid Mechanics--Soviet Research, Vol 2, No 5, p 152-156, September-October 1973. 2 fig, 2 tab, 8 ref. (Originally published in Gidromekhanika, No 18, p 31-35, 1971).

Descriptors: *Waves(Water), *Beaches, *Sands, Height, *Variability, Wavelengths, Slopes, Measurement, Equations.
Identifiers: *USSR(Crimea), *Wave runup.

Measurements were made of wave runup height in the western part of the Crimea on a beach composed of medium- to coarse-grained sand containing rolled shell fragments. A stretch of straight beach was selected as the observation site. Periodic measurements and leveling operations were performed during calm periods on each leveling line to assess the state of the coastal slope and beach between storms. Pickups of the marine wave gage (GM-16) were fastened to piles and connected via cables to the EPP-09 potentiometer to measure wind-wave height at various points along the underwater slope. The first recording of waves approaching from the sea was made at a depth of 7-8 m, 350-400 m from shore; the second was made at a depth of 4-5 m, 200-250 m from shore. The height of wave runup was fixed visually from a reading on a decimeter tape laid out on the surface of the beach for each of the 100-150 waves and recorded in a logbook. A total of 17 storm seconds were processed. Wave height of 1% expectation was 0.35-1.8 m; average wavelength was 10-41 m; and the angle of approach was 4-65 deg. The coefficient of variation of wave runup height ranged from 0.18 to 0.4. Formulas are given for estimation of wave height on flat slopes. (Josefson-USGS)

W74-05025

MOVEMENT OF WATER ALONG THE SHORE AND NORMAL TO IT IN THE NEAR-SHORE ZONE OF A SHALLOW-WATER COAST,
Akademiya Nauk SSSR, Kaliningrad. Institut Okeanologii.
A. I. Filimonov.
Oceanology, Vol 6, No 4, p 530-534, 1966. Trans. from Okeanologiya, Vol. 5, No. 3, 1965. 1 fig, 3 tab, 5 ref.

Descriptors: *Currents(Water), Topography, *Sediment transport, *Shallow water, Coasts, *Storms, *Winds, Beaches, Slopes.
Identifiers: *Longshore currents, Nearshore processes, *Water transport asymmetry.

From an evaluation of experimental studies of storm-generated movements of water made with recording current meters, it has been possible to trace the distribution of near-bottom velocities in the longshore movement on the profile of the submarine beach slope and to consider movements parallel to and normal to the shore in their interaction. The stretch of coast examined in 1963 had two submarine ridges, whereas in the summer of 1962 there were three ridges on the same stretch. This indicates considerable reconstruction of the profile of the submarine beach slope. Alternating movements of water normal to the shore take place against a background of prevailing longshore flow. The amount of water transported by the longshore flow is 60-80% of the discharge through a section perpendicular to the total current vector, and the magnitude of this transport is related to the wind direction relative to the shoreline. There is a fairly marked asymmetry of water discharge in the bottom longshore flow. The return flow ranges between 1 and 17%. The asymmetry of water transport is less pronounced in bottom flow to the shore, and the ratio may be unity. (Sinha-OEIS)
W74-05028

COMPOSITE ENERGY FLUXES AS FACTORS IN COASTAL FORMATION,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
I. A. Pravotorov.
Oceanology, Vol 5, No 3, p 66-68, May 1966. 12 ref. Trans. from Okeanologiya, Vol. 5, Nol 3, 1965.

Descriptors: *Waves(Water), *Currents(Water), Shores, Winds, Meteorology, Hydrology, Topography, *Eddies, *Storms, *Energy, *Shallow water.
Identifiers: Beach cusps, Scalloping, Bottom topography, Nearshore processes, *Longshore currents.

A number of phenomena taking place in the nearshore zone are not satisfactorily explained purely in terms of wave processes and the currents associated with them, or in terms of the currents accompanying surges. Among these phenomena are the wave-associated 'rhythmic' medium scale formations. Beach cusps are evidently another formation whose 'rhythmic' inception is not readily explainable by the effect of the energy flux of waves alone. The 'rhythmic' windings of the isobaths in a zone of ridges on the submarine slope of accumulation features in the form of 'harmonics' of various scales is reminiscent of similar phenomena occurring below water. Scalloping is also a feature of hydrological fronts in the presence of wind, whereas waves approaching the front are greatly attenuated, and at the front break and are destroyed. Many phenomena observed in the nearshore zone are not solely due to wave action. The formation of sand ridges and ridges of algae at an angle to the coast is reminiscent of the action of Langmuir eddies generated by the wind and, it must be supposed, interacting with the waves as they are destroyed on approaching the shore. When eddies which have developed over deep water areas during an intense storm enter shallower water they begin to affect the sea floor. Smaller eddies induced by the larger eddies and maintained by wind energy continue to advance towards the shore until they are completely destroyed in interaction with the bottom and with the waves; this affects the material-moving capacity of the waves and is reflected in coastal dynamics. NONLINEAR DEVELOPMENT OF THE RAYLEIGH-TAYLOR INSTABILITY IN THE 'SHALLOW-WATER' APPROXIMATION,
Naval Research Lab., Washington, D.C.
D. L. Book, E. Ott, and A. L. Sulton.
Available from NTIS as AD-768 296, $2.75 in paper copy. NRL Memorandum Report 2642, September 1973. 17 p, 4 fig, 12 ref.

Descriptors: *Shallow water, Gravity, *Interfaces, Fluid mechanics, Dynamics.
Identifiers: Riabouchinsky formulation, Gas-dynamic analogy, Rayleigh-Taylor instability, Fluid layers.

The nonlinear evolution of the Rayleigh-Taylor instability in the long wavelength limit is investigated for an incompressible fluid supported against gravity (or inertial forces) by a massless fluid and bounded above by a rigid wall. In plane geometry, the equations are identical with those of shallow water theory, but with the sign of the gravitational acceleration reversed. They are rewritten in the Riabouchinsky (gas-dynamic analogy) formulation and solved numerically. The shallow water approximation permits a solution for the motion of the interface without reference to the detailed motion of fluid in the interior. There is a range of parameters in which the nonlinear development of the Rayleigh-Taylor instability in an ideal fluid can be simply described in terms of the motion of the interface, that is, essentially one-dimensionally. The resulting equations have been solved numerically to yield a universal functional form of this motion. The time over which this solution can be expected to hold depends on the parameters with which it is scaled. The solution found here is only valid until vertical displacements become of the order of the wavelength. Thereafter the flow is essentially two-dimensional and the shallow water description is not applicable. The results given will be useful in liner stability analyses, however, if the fastest growing wavelength observed experimentally is of the order of or larger than the the minimum radius the liner is designed to reach, or if the growth rates are such that the 'dwell time' of the liner is comparable to that required to reach the breakdown point of the model. Descriptors: *Estuaries, *Delaware, *Water circulation, Water quality, Water pollution, Saline water intrusion, Dissolved oxygen, Tides, Turbidity, Mixing, Hydrography.
Identifiers: *Broadkill River(Del).

The hydrography of the Broadkill River, a narrow, shallow estuary in southeastern Delaware, was studied from July 1966 through February 1971. Measurements of current velocity, tide stage, salinity, water temperature, dissolved oxygen, pH, and turbidity were made at several stations along the course of the estuary. The Broadkill River has characteristics of both a partially-mixed and well-mixed estuary. During normal runoff the system discharges 130,000 cu m of freshwater per tidal cycle. The flushing time of the entire system increases from 10.3 tidal cycles during high runoff to 24.2 tidal cycles during low runoff. The lower estuary, the most seaward 25% of the system, is sectionally homogeneous during 90% of each tidal cycle. Homogeneity is maintained by strong tidal currents. The flushing time of the lower estuary is relatively constant and increases from 0.6 to 0.9 tidal cycle with decreasing freshwater runoff. The tidal river, the farthest upstream 40% of the system, is rarely invaded by saline water from the upper estuary. This section is polluted through the discharge of organic wastes into the river at a point 0.5 km downstream from the river's source. Downstream from the source of pollution, anoxic conditions are present from spring through autumn and are relieved only during the coldest months of the winter. (Knapp-USGS)

RHODE ISLAND'S BARRIER BEACHES: VOLUME I, A REPORT ON A MANAGEMENT

PROBLEM AND AN EVALUATION OF OPTIONS,
Rhode Island Univ., Kingston. Coastal Resources Center.
S. B. Olsen, and M. J. Grant.
Marine Technical Report No 4, 1973. 118 p, 3 fig, 19 ref, 3 append.

Descriptors: *Barrier islands, *Beaches, *Water resources development, *Rhode Island, Management, Reviews, Evaluation, Recreation facilities, Erosion control, Beach erosion, Hurricanes, Shore protection, Ocean waves, Environmental effects, Marshes, Ecology, Social aspects.
Identifiers: *Barrier beaches.

Information is summarized and evaluated on management problems of the barrier beaches along Rhode Island's ocean coast. A barrier beach is a narrow strip of land made of unconsolidated material that extends roughly parallel to the general coastal trend and is separated from the mainland by a relatively narrow body of water. In the great majority of cases Rhode Island barriers are the seaward boundaries of coastal ponds, many of which are salt or brackish. The barriers have been formed by longshore currents and waves that have deposited sediments, chiefly sand and pebbles, across shallow embayments. The barriers are low in profile and are highly vulnerable to hurricane damage. (Woodard-USGS)

ECONOMIC ASPECTS OF A NUCLEAR DESALINATION AGRO-INDUSTRIAL PROJECT IN THE UNITED ARAB REPUBLIC,
New York State Coll. of Agricultural and Life Sciences, Ithaca. Dept. of Agricultural Economics.
D. Chapman.
American Journal of Agricultural Economics, Vol 55, No 3, p 433-440, August 1973. 6 tab, 24 ref, 1 append.

Descriptors: *Financial feasibility, *Cost-benefit analysis, *Irrigation programs, *Desalination, *National income, *Investment, Operating cost, Governments, Systems analysis, Optimization.
Identifiers: *Agro-industrial projects, *Social benefits, *United Arab Republic(El-Hamman-Egypt).

In recent years, the possibility of desalting sea water to produce irrigation water for large-scale commercial agriculture and industry has been considered as a means of stimulating cooperation and economic development in the Middle East. This study investigates the financial feasibility and the social benefits and costs of nuclear desalination agro-industrial projects. Financial feasibility and national income benefit analyses are performed. The financial analysis determines project investment and operating costs, revenues, cash flows, and profitability with likely market prices and government policies. The benefit-cost analysis examines the effect of the project on macroeconomic goals such as employment, foreign trade, capital scarcity, and national income. The project site is El-Hamman, 30 miles west of Alexandria and chosen because of its soil characteristics, present unsettles status, and nearness to market and port facilities. Project design was carried out in three simultaneous phases: selection of agricultural and livstock commodities for maximum profit from use of project water; examination for maximum profit of industries having electric-intensive production processes; and engineering examination of 500-megawatt electric power plants operated in association with desalination plants to determine least costly methods of production. As presently designed, such a complex appears to require deficit financing, provide little employment, retard national income growth compared to other investment opportunities, and increase the foreign exchange deficit. Identifiers: *USSR(Golodnaya Steppe).

Experiments in rice paddies showed that strongly saline soils can be desalinized in a single season by using deep permanent drains and closely spaced shallow temporary drains. Investigations were conducted on Meadow-Sierozem soil in the Golodnaya Steppe where total toxic salt content of the soil ranged from 0.5% in the upper layer of the zone of aeration to 2.5% in the lower layer, and permeability in these layers ranged from 0.5 m/day to 0.03 m/day, respectively. Deep permanent drains spaced 330 m apart and shallow temporary drains spaced 20 m apart desalinized the soil to a depth of 120-130 cm within 72 days using 5,000 cu m of water/ha and to a depth of 150 cm within 112 days using 8,300 cu m of water/ha. Under the same conditions but with more frequent application of deep drains during this time, the soil was desalinized to a depth of 4.5 m. (Josefson USGS)

Descriptors: *Irrigation, *Dry farming, *Agriculture, Arid lands, Cereal crops, Soils, Irrigation systems, Irrigation canals, Irrigation design, Irrigation programs, Irrigation wells, Groundwater, Groundwater recharge, Groundwater resources, Water resources, Water resources development, Water supply development.
Identifiers: *Iran(Garmsar area).

The garmsar area of Iran is an arid zone of approximately 50,000 hectares on the edge of the great salt desert of central Iran. A very dry climate prevails in the area, offering insufficient water to irrigate all the arable lands. High temperatures and soil-drying winds characterize the climate. The Hablehrud River and its tributaries are the principal source of agricultural water in the region with an annual flow of 247.7 mcm. which is fairly saline. Groundwater extraction offers only an additional 35 mcm. of similarly saline water. These water quality conditions contribute to the cause of the salty and calciferous soil of the region. Current irrigation development includes a canal system of about 920 km total which diverts the flow of the Hablehrud. This system irrigates barley and wheat primarily, but some cotton is also cultivated. The regional development plan includes increased use of groundwater, saline soil reclamation, additional surface water development and recharge augmentation. These steps are expected to greatly improve the agricultural productivity of Garmsar. (Muller-Arizona)

ver 90 percent of Iran receives less than 500 mm precipitation annually. Peculiarities in omorphology and land degradation have led to e development of saline soils in the region. The tural processes of salinization of soils are scussed, including geology and geochemical fac-rs, wind effects, geomorphology, biological fac-rs, and surface water effects. The high salinity surface waters is determined to be a significant ctor in soil salination during periods of extensive nual flooding. Manmade or secondary saliniza-on is also found to be a significant factor, usually king the form of irrigation and soil mismanage-ent. A decrement in groundwater quality is also oted. The application of saline groundwater in ir-gation enhances soil salination. These saline soils fer crop yields under the optimum production vels. Salination effect studies are proposed as e studies in salt-tolerant crop breeding. Salinity ntrol measures are proposed, including land ainage, irrigation management, and leaching. armer awareness of both salinity problems and ntrol methods is emphasized. (Muller-Arizona) 74-05218

tion, Crop production, Growth rates, Growth stages, Height, Productivity, Soil-water-plant relationships, Climatic data, Testing, Productivity, Crops, Cultivation.

The cotton production system is defined by a multi-component flow-chart model. The principal component of the system is the actual cotton plant. A digital computer simulation of a cotton plant is developed. This model uses hourly input data of air temperature, water vapor pressure gradient, incident short wave radiation, carbon dioxide concentration, soil moisture tension, soil temperature, soil impedance to elongation of the hypocotyl, sun altitude and acute angle between sun azimuth and cotton rows to generate hourly water content weight percentage in the seed during the preemergence growth stage and to generate hypocotyl length, change in hypocotyl length, percent of seed that have emerged and percent of seed energy that has been expended during the post emergence growth stage. This model is validated with actual data. Five appendices are included which deal with model input estimation, program variable identification, program use, sample input and output and field monitoring techniques. (Muller-Arizona)

Identifiers: *Turkey.

While rainfall is too limited to permit annual cropping in many arid and semi-arid areas, such regions including parts of Turkey and the United States, do lend themselves to both partial year cropping and fallow. Such a procedure was found to give a higher total production than annual cropping for winter wheat. The primary purpose of the fallow system is to accumulate moisture in the soil root zone area during no-production periods for the crop to consume during growing periods. The maximum accumulation will occur when proper weed control reduces unwanted evapotranspiration, when the soil has a high infiltration rate to incident rainfall, when the surface of the field is sloped such that surface movement of water is sufficiently slow for proper infiltration, when irregular tillage is avoided which increases soil evaporation surfaces and when a moisture barrier such as mulch is introduced to store accumulated moisture. Such fallow procedures are found optimal in the summer months during which only about 25 percent of the annual rain falls. Summaries are presented for the testing of 80 different treatment combinations over a two-year experimentation period for a study area in Turkey. These studies offer the additional conclusion that treatment timing is important in the fallow process and that mechanization is necessary for the proper timing to be realized. (Muller-Arizona)

Identifiers: *Iran.

Seventy-three percent of Iran is arid or semi-arid land, and much of the remainder is mountainous. If Iran is to keep pace with its rapidly growing population, it must expand its agriculture. In attempting is determine the optimal land usage, maps classifying land resources with respect to agriculture (both dry land and irrigated), range, forests and recreation were constructed. Development is planned in light of the recommendations of these surveys. Irrigation and drainage techniques, field leveling and grading, crop water demand, and soil fertility-irrigation interaction are additional technological considerations in the planning process. Four areas of research offer Iran improvements in agricultural yield. Dryland farming, saline soil reclamation, use of water of impaired quality and fertilization are being explored for this purpose. The overall priorities of national research coordination, support of research institutions, integration of activities on the farm level, and regional, national and international exchange of experience are the underlying factors that will lead to the eventual success of Iran's agricultural planning. Identifiers: *Turkey.

Hydrological and related activities in Turkey, including the definition of climatic zones, the classification used for defining the arid and semi-arid zones, and hydrological activities which have been carried on in Turkey, are discussed. Agricultural drought studies with respect to hydrology and a proposal for drought studies in the agricultural areas of arid and semi-arid zones are summarized. An arid zones research institute should be established to study the problems of the area. Hydrologic surveys are proposed to gather data on climate, land classification, water requirements, water utilization and drought frequency. Studies in evaporation control, usage of water of impared quality, soil-water-plant-energy relationships, and irrigation are proposed. These studies are expected to furnish the necessary data for the evaluation of dryland regions with respect to hydrology and agricultural potential. (Muller-Arizona)

Identifiers: *Turkey.

Wheat is the principal agricultural commodity Turkey. The production of this commodity has i creased an average of 33 percent per annum ov the last 20 years to a level where little land remai for agricultural expansion. Much of the land cu rently in cultivations is in arid areas with insuf cient water for optimal production. Curre research is aimed at augmenting the quantities water used in irrigation and improving irrigati methods to increase wheat production. This adc tional irrigation water is to be obtained by wat conservation practices on available precipitati water. These practices include weed control, inf tration encouragement through tillage practice and fallow processes. New varieties of wheat al offer some possibilities in increased productio The Wheat Research and Training Center in A kara, Turkey, is conducting research in the fields. (Muller-Arizona)

Land and water resources, the existing level of development and problems associated with it, and new approaches to such problems on the Turkish peninsula are reviewed. Turkey has a total land area of 78.1 million hectares, of which about 35 percent of this is cultivated, 26 percent is in grass and pastureland and the remaining 39 percent is forest and unproductive land. The agricultural portion has expanded greatly in recent years, in part due to reclamation projects of swamps and wild olive groves. A survey of the available water resources in Turkey shows that the 26 principal drainages in the country have an annual potential of 166 billion cubic meters. Of this about 80 billion cubic meters can be feasibly developed. An additional 8 billion cubic meaters of safe yield groundwater make the annual total available water resources of Turkey 88 billion cubic meters. Existing levels of cropland expansion and irrigation development are discussed. An additional expansion of 25.5 million hectares of agricultural land may be developed from dry lands and supported by the available water resources. (Muller-Arizona)

In: Agricultural Aspects of Arid and Semi-arid Zones, CENTRO seminar, 1972, p 12-24. 1 tab.

Descriptors: *Dry farming, *Water harvesting, *Rain water, Water conservation, Agriculture, *Arid lands, Farm management, Precipitation(Atmospheric), Soil water, Runoff, Water yield improvement, Water storage, Water supply, Soil-water-plant relationships, Soil moisture, Water management(Applied), Infiltration, Land use, Land management.

Arable land in dry regions is normally irrigated to make it agriculturally productive. Such irrigation is usually done with nearby water supplied. When such water supplies are not availabl, these lands are forced to produce with the limited amount of precipitation water available. These conditions lead to the necessity of dry land farming: the conservation of the limited available precipitation water and its optimal use in agriculture. The first aspect of dryland farming entails runoff loss minimization, soil water storage, crop yield incrementation with increased water supply, snow conservation, and optimal use farming methods. The second aspect involves water harvesting, the increase of available water through collection and redistribution systems. If these aspects are realized, it remains to employ the stored water in the most efficient method possible. This must be done by evaluating the optimal use to which the water and associated land may be put (grazing, cultivation, etc) and the optimum technique by which this use may be realized. These dry land farming procedures, when practiced within an overall development plan, lead to the maximum production of lands with otherwise insufficient water supply. (Muller-Arizona)

THE ARID ZONE PROBLEMS IN TURKEY,
Ankara Univ. (Turkey). Faculty of Agriculture.
S. Elci.
In: Agricultural Aspects of Arid and Semi-arid Zones, CENTRO seminar, 1972, p 45-51.

Descriptors: *Agriculture, *Dry farming, *Forages, Pastures, Pasture management, Crop production, Forage grasses, Grazing, Irrigatin practices, Range management, Soil management, Regional development, Irrigable land, Irrigation, Land development, Land management, Arid lands, Arid climates, Asia.
Identifiers: *Turkey.

The population growth rate of Turkey indicates that if its people are to be fed in the future the agriculture of that country must be greatly expanded. Several limiting factors exist concerning such expansion. Much of Turkey's agricultural land is arid. Precipitation is both little and poorly distributed through the growing year. An analysis of agricultural development priorities shows the development and exploitation of pasture lands is a desirable course of action. Several good forage crops which would be useful to this end are not grown in Turkey, although their origin is there. The cultivation of plants for optimal forage production should be based on rotation, soil and climatic conditions for plant production in the region. Twenty-four points of consideration are presented which must be examined to this end. An additional 16 long-term research topics are presented which should be examined for long-range effective agriculture development. The rapid development of arid zone agriculture, such as that required by Turkey, should be conducted along these study guidelines for solid planning bases. (Muller-Arizona)

The encroachment of velvet mesquite on the grass-covered rangeland of the semiarid southwestern United States has become a significant problem to grazing in the last half century. It has been shown that as few as 25 mesquite trees per acre can reduce the available perennial grass production by fifty percent. This study examined several grassland plots at two locations in southern Arizona in an attempt to determine the invasion rates of mesquite into the grassland environment. Stem diameter, plant height, and crown width were the plant parameters considered and plant density was the plant community parameter employed. Four samplings over a 20-year period of record were made and mesquite occurrence data analyzed. Velvet mesquite was found to increase significantly in the study areas during the period of observation. Plots which remained undisturbed during the entire observation period showed dramatic reductions in grass productivity due to mesquite encroachment. Bulldozing and burning of plots interrupt mesquite invastion only temporarily, indicating persistent periodic control measures would be required for proper control. Herbaceous vegetation was not influenced by mesquite population changes as was the perennial grass. Early and repeated control measures are optimum. (Muller-Arizona)

SANTA RITA EXPERIMENTAL RANGE: YOUR FACILITY FOR RESEARCH ON SEMIDESERT ECOSYSTEMS,
Forest Service (USDA), Tucson, Ariz., Rocky Mountain Forest and Range Experiment Station.
S. C. Martin, and H. G. Reynolds.
Journal of the Arizona Academy of Science, Vol 8, No 2, p 56-67, June 1973. 5 fig, 1 tab, 179 ref.

Descriptors: *Desert plants, *Deserts, *On-site laboratories, *Research facilities, Pastures, Climates, Grasslands, Ecology, Range management, Semiarid climates, Arid lands, Ranges, Range grasses, Forage grasses, Brush, Vegetation regrowth, Land use, Sites, Habitats, *Arizona.

The Santa Rita Experimental Range, a 50,000-acre experimental facility 30 miles south of Tucson, Arizona, is a research site for semidesert ecosystems that has been used continuously for 70 years. Rainfall averages from 10 inches per year at the lower elevations to almost 20 inches per year in the uplands. The area is predominantly grass and brushland with a great variety of semiarid land wildlife. To date studies include grazing, range seeding, grass-shrub ecology, wildlife, and desert biomes. Because of its location, the area lends itself to a variety of arid and semiarid land studies associated with hydrology and water resources. Since the Range is purely a study site, the natural environment has been distrubed to a minimum, making Santa Rita Experimental Range an ideal outdoor laboratory. (Muller-Arizona)

DENSITY OF GROWTH AND LEVEL OF FERTILIZATION AS INFLUENCING THE WATER CONSUMPTION OF MAIZE, (IN BULGARIAN),
Academy of Agricultural Sciences, Chirpan (Bulgaria). Inst. of Cotton.
G. Nikolov.
Rasteniev'd Nauki. Vol 9, No 4, p 69-82. 1972. Illus. (English summary).
Identifiers: *Fertilization, *Growth, *Corn(Field), Water consumption, *Bulgaria, Irrigation.

The water consumption of maize grown under irrigation on leached chernozem smolnitsa soil was studied in 1966-1969 at crop stands of 32,000, 44,000 and 58,000 plants/ha, at row spacings of 70 and 90 cm and at levels of fertilization in kg/ha of N100P80K10 and N200P160K80. The consumptive use of water of maize varies comparatively a little with increasing the number of plants per hectare and with raising the level of fertilization and does not vary in dependence on the inter-row spacings. A rectilinear relation exists between the 24-hr values of the consumptive use of water, the leaf area, the increment in the biological yield and net productivity of the photosynthesis which determines the correlation between the rhythm of water consumption during the crop-season and the related productivity of organic substance. Water withdrawn from the upper 50 cm soil layer accounts for 66.8-68.9%. from the 51-100 cm layer for 23.8-25.0%, and from the 101-200 cm soil layers

for 7.2-8.5% of the water consumption of maize. The total amount of irrigation water given to the crop accounts for 37.0-37.5%, rainfall during the crop-season for 37.1-39.3% and the withdrawal from the water stored in the soil accounts for the least percentage. The consumptive use of water of maize grown in South-Bulgarian chernozem smolnitsa soils, at a crop density of 44,000 plants/ha and at fertilizer level of N200P160K80 in kg/ha amounts to 523 mm and its 24-hr values average 3.96 mm. The biological coefficient of water consumption after A. M. Alpatev varies between 0.46 and 0.51 and has a mean value of 0.50.--Copyright 1973, Biological Abstracts, Inc.

IN VITRO INTERACTIONS OF FUSARIUM AND VERTICILLIUM WILT FUNGI WITH WATER, PH AND TEMPERATURE,
J. B. Manandhar, and G. W. Bruehl.
Phytopathology. Vol 63, No 3, p 413-419. 1973. Illus.
Identifiers: *Cotton diseases, *Fungi, *Fusarium-Oxysporum-F.-Sp.-Vasinfectum, Growth, In-vitro interactions, Soils, Temperature, *Verticillium-Albo-Atrum, Wilt, Hydrogen ion concentration.

Fusarium oxysporum f. sp. vasinfectum and the microsclerotial form of Verticillium albo-atrum pathogenic to cotton grew progressively slower in soil as the predominantly matric water potentials in soil were lowered below 0. In contrast, both fungi grew optimally at about -10 to -30 bars at 25C in either agar media or in soil when water potential was regulated osmotically. The osmotic stimulation of both fungi was independent of the solute used and occurred in agar media when water potentials were adjusted with NaCl, KCl, CaCl2, MgCl2, a salt mixture, or sucrose, and on straw in sterile soil when water potentials were osmotically adjusted. At water potentials below the stimulatory range, growth decline linearly and was zero at near -100 bars for V. albo-atrum and at near -115 bars for F. oxysporum. A water stress of -40 to -60 bars reduced the growth of both to about half the maximum rate. Both fungi grew well at pH values ranging 5.2-8.6, and no significant interactions of pH and water potential were observed. A highly significant temperature X water interaction occurred in both wilt fungi: the magnitude of growth stimulation with slightly reduced osmotic water potential increased with rising temperature. No new in vitro responses to water, pH, temperature, or to interactions of these were observed that explain the different distributions of these wilt fungi in nature.--Copyright 1973, Biological Abstracts, Inc.

WATER PROPERTIES AND WATER REGIME OF SOD PODZOLIC SOILS AND MEANS OF THEIR IMPROVEMENT (IN RUSSIAN),
K. I. Baltyan.
Tr Vses Nauchno-Issled Inst Udobr Agropochvoved. 47. p 193-202, 1970.
Identifiers: Cereal crops, Frost, Grass, Perennial grasses, Plowing, Potato, Pulses, *Sod podzolic soils, Soils, Spring, Water supply, Winter, *Root zone, *USSR(Moscow region).

The water supply for crops on sod podzolic soils in the Moscow region, USSR, may be improved by a single meliorative plowing, whereby the humus horizon is left on the top and the underlying podzolic and illuvial horizons are intermixed. Thus, the depth of the root zone may be extended to 30 cm in the northern and eastern regions and to 40 cm in the southern and western regions of the non-chernozem zone for perennial grasses and winter crops that complete their growth before the onset of autumn frosts. For spring cereal crops, pulses, potatoes and other crops of low resistance to frost, the root zone can be deepened to 20 and 30 cm.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Beet, Clover, *Fertilizers(Mineral), Fodder, Grass, Irrigation, Liquid manure, Minerals, Nutrition, Potato, Pure, *Sewage, Sugar, Nitrogen, *Farm wastes, *Nutrients, *Phosphorus.

More nutrients, especially P, are extracted by the field crops irrigated with plain water than without irrigation. The N doses and irrigation rates for sugar and fodder beets, potato, grasses and clover recommended in the German Democratic Republic are given. The amount of nutrients in sewage cannot compensate the large uptake by the crops (on the average, 100 mm communal sewage contains 60 kg N, 76 kg P2O5 and 42 kg K2O). Sprinkling with sewage is supplemented with P 70-90 and K 80-100. N fertilizers are especially important. The doses of liquid manure and its application dates for field crops and hay cutting pastures are given. Liquid farmyard manure contains 0.45% N, 0.08% P and 0.23% K. Assimilation of nutrients from liquid manure amounts to 40-80% N, 55-90% K, depending upon the dates of application. The utilization factor for P is 50%.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF CROPS AND THEIR PREDECESSORS ON THE AGGREGATE COMPOSITION OF MEADOW SIEROZEM SOILS, (IN RUSSIAN),
P. S. Bulakhova.
Tr Kaz S-Kh Inst. Vol 13, No 2, p 117-121. 1970.
Identifiers: Barley, Beet, Corn, *Crops, Meadow, Peas, *Sierozem soils, Wheat, *Soil aggregates.

The aggregates were separated on sieves in water after preliminary capillary saturation of the soil sample. Observations indicated that the meadow sierozem soils possess good water-stable structure. The total aggregates larger than 0.25 mm in the top 60-cm layer make up from 65-79%, of which the most valuable aggregates, 5-1 mm, amount to 26%. The effect of different crops on the aggregate composition of the soil varies. Under corn the total aggregates exceeded by 6-8% the amount under wheat, down to a depth of 40 cm; it was higher by the same amount under wheat at the depth of 40-60 cm, and mainly on account of aggregates measuring 2-1 mm. The content of aggregates was markedly lower under barley following wheat after beet, down to 45-28%, while aggregates measuring 5-1 cm dropped to 19-25%. The decline was marked in particular among aggregates 2-1 mm, being only 11% in the upper horizon under barley, as against 32 and 20% under corn and wheat, respectively. The effect of pea crops on soil structure proved to be most favorable.--Copyright 1973, Biological Abstracts, Inc.

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

THE APPLICATION OF BINARY TREE STRUCTURES TO HYDROLOGIC NETWORK SIMULATORS,
Nebraska Univ., Lincoln. Dept. of Computer Science.
G. McManis.
Available from National Technical Information Service as PB-228 698 $8.00 in paper copy, $1.45 in microfiche. MS Thesis, May 1972. 94 p, 28 fig, 3 tab, 10 ref, 5 append. OWRR B-016-NEB(1).

Descriptors: *Simulation analysis, *Hydrographs, Storms, *Computer programs, *Drainage systems, Channels, *Networks, Runoff, Systems analysis, Mathematical models, *Nebraska, City planning, *Urban drainage, Storm drains.
Identifiers: Lincoln(Neb).

Dynamic simulation techniques can provide urban water planners with needed hydrologic response information. Such techniques for modeling the interactions between (1) a storm bounded by a generalized polygon, and (2) any arbitrarily distributed network over which the storm passes are described and demonstrated. A simulator for the hydrologic response of any encoded channel network has been designed and implemented in FORTRAN. The network is represented by a binary tree structure within which the topologic connections, geometric and other attributes of its segments can be introduced, altered, and retrieved by a set of programmed functions. The comprehensive computer package can model either the behavior of existing drainage systems or the expected performance changes from modification of drainage systems. The simple, yet detailed distributed model has the potential of revealing worst-case velocities or patterns for moving storms. The model has been applied to an existing drainage system, simulating both the runoff at any point and the cumulative behavior in relation to a given storm description. (Bell-Cornell)

THE IDENTIFICATION AND QUANTIFICATION OF THE NET EFFECTS OF MULTIPLE-PURPOSE RIVER BASIN DEVELOPMENT,
Georgia Univ., Athens. Inst. of Natural Resources.
R. M. North, and J. Sellers.
Available from National Technical Information Service as PB-228 588 $11.50 in paper copy, $1.45 in microfiche. Environmental Resources Center, Georgia Institute of Technology, Atlanta, Report ERC-0773, June 1973. 155 p, 5 fig, 16 tab, 189 ref, 2 append. OWRR A-040-GA(2). 14-31-0001-3810.

Descriptors: *Evaluation, *Project feasibility, *River basin development, *Cost benefit analysis, *Social aspects, *Economic feasibility, Project planning, Water control, *Appalachian Mountain Region, Alternative costs, Flood control, Water quality, Tennessee Valley Authority, North Carolina.
Identifiers: Upper French Broad River basin(N.C.), Multiple objective planning.

A methodological and pragmatic basis is presented from which to measure and evaluate future river basin development projects within the framework of multiobjective principles and standards. The Upper French Board River Basin and a proposed 14-reservoir TVA project within the basin were selected for a case study of traditional benefit-cost analysis and subsequent multiple-objective comparisons with the national economic development, environmental, social, and regional economic development analyses. The areas of economic theory and public finance were integrated with the environmental aspects to develop a systematic process for evaluation of benefits and costs considering resources displaced as well as environmental and social costs imposed. The benefits claimed and views held for public investments in water resources by various interest groups were explored for the region. No significant relationship between the presence of water resources projects and economic activity was found for a region in which water resources is not the limiting factor in the economic mix. Specific methodological and field level improvements are suggested for future water resources project evaluation to insure consideration of the complete range of alternative solutions to flood control, recreation, water supply and other problems while minimizing adverse economic, environmental, and social impacts.
W74-04854

OPTIMIZATION OF OPERATION OF A SYSTEM OF FLOOD CONTROL RESERVOIRS,
Missouri Univ., Columbia. Dept. of Civil Engineering.
A. T. Hjelmfelt, Jr., and N. X. Tsiourtis.
Available from National Technical Information Service as PB-228 606 $9.75 in paper copy, $1.45 in microfiche. Missouri Water Resources Center Completion Report, July 1973, 122 p, 37 fig, 8 tab, 9 ref, 2 append. OWRR B-065-MO(1). 14-31-0001-3607.

Descriptors: *Flood control, *Probability, *Linear programming, *Optimization, *Reservoir operation, *Reservoir releases, Time series analysis, Computer program, Hydrographs.
Identifiers: *Kansas River basin.

Probabilistic methods of hydrology and optimization techniques were used to determine an optimal sequence of releases from a system of reservoirs during a flood emergency. The operation schedule for a reservoir was determined from estimated inflow to the reservoir, current reservoir contents and downstream conditions. Linear programming was used to establish the optimal operating procedure. The duration of the flood producing storm was divided into a series of equal time increments, an inflow into each reservoir estimated for each time increment and a release made from each reservoir during each time increment. The objective function (to be maximized) was taken to be the sum of all reservoir releases during the duration of flood inflow to the reservoirs.

A STOCHASTIC SNOW MODEL TO EVALUATE RESERVOIR OPERATION,
Arizona Univ., Tucson. Dept. of Watershed Management.
M. M. Fogel, L. Duckstein, and C. C. Kisiel.
Paper presented at 54th Annual Meeting of American Geophysical Union, April 16-20, 1973, Washington, D.C. 20 p, 5 fig, 10 ref. OWRR B-032-ARIZ(4).

Descriptors: *Snowmelt, *Runoff forecasting, *Reservoir operation, *Statistical models, *Stochastic processes, Melting, Temperature, Rainfall, Snowpacks, Water equivalent.

A methodology is given to forecast snowmelt to allow managers of water resources systems to regulate reservoir releases to minimize expected losses. Using an event-based precipitation model, a distribution function of water available for runoff is obtained. The amount of water available for runoff is the sum of the water equivalent of snow on the ground at the time the forecast is made, and the predicted amount of precipitation during the forecast period. A melt coefficient, a random variable, is a function of predicted temperature. The distribution function of snowmelt runoff is the product of the two random variables involving the predicted precipitation and temperature. A one-period objective function is defined to determine a reservoir release rate which would minimize expected losses. (Knapp-USGS)

HYDROLOGIC CHARACTERISTICS OF ALDER CREEK, IRON COUNTY, WISCONSIN,
Geological Survey, Madison, Wis.
B. K. Holmstrom, W. A. Gebert, and R. G. Borman.
Open-file report, June 1973. 10 p, 9 fig, 8 tab, 6 ref.

Descriptors: *Streamflow, *Sedimentation, *Wisconsin, *Reservoirs, Floods, Peak discharge, Low flow, Sediment yield, Hydrologic data, *Pre-impoundment.
Identifiers: Alder Creek(Wisc).

The hydrologic characteristics of Alder Creek, Iron County, Wisconsin, were studied so that water-resource planners could evaluate a reservoir site. The hydrologic characteristics estimated were the mean flows, low flows, flood peaks, suspended-sediment discharge, and depth to bedrock. Also included is an estimate of the time required to fill the proposed reservoir. The probable maximum flood (PMF) at the damsite of the proposed reservoir has a peak of 41,000 cfs and a 24-hour volume of 19,700 acre-feet. A full reservoir reduces the time of concentration of storm runoff, which results in a higher peak discharge than under preimpoundment conditions. The estimated filling times ranged from 18 months for an elevation of 1,410 feet to 76 months for an elevation of 1,430 feet. Sediment deposition was estimated to be 220 tons per year. (Knapp-USGS)
W74-04920

REASONABLE STATE REGULATION OF THE INTERSTATE TRANSFER OF PERCOLATING WATER,
Cornell Univ., Ithaca, N.Y.
M. D. White.
Available from the National Technical Information Service as PB-229 087, $4.50 in paper copy, $1.45 in microfiche. Technical Report 64, Cornell University Water Resources and Marine Sciences Center, Ithaca, N.Y., May 1973. 24 p. OWRR A-027-NY(3). 14-01-0001-1852.

Descriptors: *Water supply, Water resources, *Water transfer, *Interstate, *Water law, *State jurisdiction, *Percolating water, Federal jurisdiction, New York, Regulation, Water pollution control, Groundwater.
Identifiers: Property rights.

Recently, Federal and State agencies have instituted water management and programs to prevent and/or clean up water pollution for purposes of maintaining the availability of adequate water supplies. Significant problems in water supply, however, result in transferring quantities of water between states. In view of the present national water crisis, Federal government regulation of interstate water transfer is often advocated. But in the absence of Federal action, the states must protect and manage their own groundwater resources. States can protect their percolating water resources only by valid conservation laws, not by antiexport statutes which discriminate against out-of-state users. (Bell-Cornell)

DETAILED PROJECT REPORT, DYERSBURG, TENNESSEE, FINLEY STREET AREA.
Army Engineer District, Memphis, Tenn.
July 1972. 19 p, 6 plates, 2 tab, 4 append.

Descriptors: *Levees, *Flood control, *Sumps, *Institutional constraints, *Project planning, Flood protection, Drainage, Pumping, Drainage programs, Cost-benefit analysis, Project purposes, Channel improvement, Hydraulics, Environmental effects, Recreation, *Tennessee.
Identifiers: *Urban renewal, Gravity outlets, Dyersburg(Tenn), North Fork, Forked Deer River(Tenn), Environmental impact.

The purpose of the project is to provide flood protection to the southwestern sector of Dyersburg, Tennessee, north of the North Fork, Forked Deer River. The area, adjacent to th central business district, contains both commercial and residential land uses, as well as being the site for an urban renewal program under the Department of Housing and Development. Plans were formulated with a primary objective of providing the 50 and 100 year flood protection requirements of the Federal Housing Administration for the urban renewal area. Construction of a levee is proposed. This necessitates provisions for interior drainage of the area. Drainage is primarily through two small channels tributary to the Forked Deer River. Several project features are designed to provide protection for all interior areas above elevation 269 feet mean sea level: (1) gravity outlets, which will discharge runoff through culverts under the levee; (2) excavated sump on the landside of the levee to provide approximately 148 acre feet for storage of interior runoff; (3) pumping station and outlet structure, when the excavated sump does not provide sufficient storage; and (4) interior channeling to transition flows into the excavated sump. A cost-benefit analysis is included. (Hoffman-North Carolina)
W74-04989

FLOOD PLAIN INFORMATION: BIG BUFFALO CREEK-LITTLE BUFFALO CREEK--CITY OF SANFORD, NORTH CAROLINA.
Army Engineer District, Wilmington, N.C.
Prepared for the City of Sanford, North Carolina. June, 1973. 24 p, 10 fig, 5 tab, 22 plates.

Descriptors: *Flood data, *Peak discharge, *Overflow, *Flood plains, Flood recurrence, Maximum probable flood, Flood profiles, Flood damage, Hydrograph analysis, Streams, *North Carolina.
Identifiers: *Big Buffalo Creek(N.C.), Little Buffalo Creek, Sanford(N.C.), Intermediate Regional Flood, Standard Project Flood.

Areas of Sanford subject to flooding from Big Buffalo Creek between McNeil Road and Wicker Steet Extension (3.11 miles), and from Little Buffalo Creek, between Northview Road and Rose Street (4.6 miles) are identified. Total drainage area of Big Buffalo Creek is 20.8 square miles; while the total drainage area of Little Buffalo Creek is 11.5 square miles. Property within flood plains, primarily residential and commercial, has been damaged by previous floods in 1945, 1952, and 1954. Development of the extensive open spaces along the creeks, expected with the expansion of the City of Sanford, would increase the severity of flood damage. Flood impact assessments are based upon estimated peak flows of the Intermediate Regional Flood, defined as one that could occur once in 100 years on the average, and the Standard Project Flood, defined as a major flood culminating from a severe combination of meterological and hydrological conditions. Peak discharges are given for selected locations. For Big Buffalo Creek at McNeil Road, peak discharges are estimated at 6,400 cubic feet per second for the Intermediate Region Flood and at 12,340 cubic feet per second for the Standard Project Flood. For Little Buffalo Creek at Northview Road, peak discharges are estimated at 2,600 cubic feet per second for the Intermediate Regional Flood and at 5,170 cubic feet per second for the Standard Project Flood. Discharge hydrographs are included. The relative water surface elevations for the Intermediate Regional Flood and the Standard Project Flood are graphed. Overflow limits for both Big Buffalo Creek and Little Buffalo Creek are detailed on contour maps. (Hoffman-North Carolina)
W74-04993

FLOOD PLAIN INFORMATION; ROANOKE RIVER-CHOCOYOTTE CREEK; CITY OF ROANOKE RAPIDS AND TOWN OF WELDON, NORTH CAROLINA.
Army Engineer District, Wilmington, N.C.
Prepared for the City of Roanoke Rapids and the Town of Weldon. June, 1973. 34 p, 10 fig, 7 tab, 16 plates, glossary.

Descriptors: Floods, *Flood data, *Flood profiles, Flooding, *Flood frequency, Flood damage, Flood control, Flood plain zoning, Flood plain, Historic floods, *North Carolina, Land use, Flood recurrence interval, Maximum probable flood.
Identifiers: Roanoke River(N.C), Chocoyotte Creek(N.C.), Roanoke Rapids(N.C.), Intermediate Regional Flood(IRF), Standard Project Flood(SPF), Weldon(N.C.).

Flooding from Roanoke River and Chocoyotte Creek has severely damaged the towns of Roanoke Rapids and Weldon in 1912, 1940, 1944, and 1945. To aid flood plain utilization and flood damage reduction, areas subject to possible future floods are identified. Factors affecting the flood intensity in these areas include floodflow obstruction, floodflow reduction measures, evacuation plans, and material storage on the flood plain. The Intermediate Regional Flood (IRF) is defined as a flood that could occur once in 100 years, while the Standard Project Flood (SPF) is a major flood expected to occur from the most severe meteorological and hydrological conditions. The extent of flooding, velocity of flow, and rates of rise and duration of flooding are calculated for both bodies of water and types of floods. Floods on the Roanoke River are characterized by slow rates of rise and long duration above flood stage, while floods on Chocoyotte Creek rise to a peak quickly, but with shorter duration. Areas covered by both flood types would be extensive and include commercial, industrial, and residential areas, but due to wider extent, greater depth of water, higher velocity of flow, and longer duration of flooding, damage Standard Project Floods is more severe than during Intermediate Regional Floods. (Grden-North Carolina)

Identifiers: *Nile River Valley Plan.

Computer simulation was used to determine the best way to control the Nile River and its tributaries in order to maximize water available for irrigation. Possible sites for control works on the Nile and its tributaries were identified, and working arrangements between them specified. These then took the form of algebraic control equations. Assumed quantities of water to be abstracted at various points in the Sudan and at Aswan in Egypt were stated as proportions of the net volume available. River behavior between 1905 and 1952 was used in the analysis. Time lags, transmission and evaporation losses, and the initial content of reservoirs were taken into account. Flow diagrams summarize the logic. The final result, the Nile River Valley Plan, is the product of successive improvements in the control equation. It gives maxima and minima for reservoir contents and controlled discharges, evaporation losses, benefits from certain conservation works, volumes of water available for irrigation, and figures for hydro-electric power. ECONOMETRIC MODEL FOR RIVER BASIN PLANNING,
M. Borlin.
Organization for Economic Cooperation and Development, Paris. Series: Problems of Development. 1971. 94 p, 5 fig, 9 tab, 86 ref, 2 append.

Descriptors: *River basin development, *Simulation analysis, *Econometrics, Benefit-cost analysis, Forecasting, Decision-making, Methodology, *Alternative planning.

A simulation model that would enable the policymaker to analyze the effects of alternative river basin development schemes on target variables, such as total population, employment rate, and income per head of household is presented. Final selection of the best development project can then be determined by cost-benefit analysis. The model attempts to internalize as many variables as possible, so that the model is nearly closed. It is modular in form, with submodels being concerned with the agricultural sector, the demographic sector, the employment sector, the income sector, and the water sector. The river basin is divided into subregions. Although the model of each subregion incorporates all the different subsectors, the subregions themselves are only linked through the water subsector. The water outflow of the upstream subregion is the inflow of the downstream subregion. The model is dynamic in that it includes explicit feedbacks, loops, delays, and time-relate variables. Results are given year by year. (Hoffman-North Carolina)

WATER MANAGEMENT,
Netherlands Universities Foundation for International Co-Operation, The Hague.
M. Klasema.
Planning and Development in the Netherlands, Vol 4, No 1, p 8-27, 1970. 8 fig, 5 photos.

Descriptors: *Water management(Applied), *Reclamation, *Land reclamation, *Water quality, *Salinity, Land management, Flood control, Dikes, Lakes, Water, Reservoirs, Drainage systems, Water level, Sluices, Water demand, Water policy, Water supply, Sea water.
Identifiers: *Netherlands(Zuiderzee), Act for Enclosure and Partial Reclamation of the Zuiderzee, North Sea, Polders.

Water management has played an importent role in the Netherlands way of life. As early as the twelfth century, the Dutch built dikes to discourage flooding. However, it was not until the nineteenth century that technology provided the tools for reclaiming polders from the sea. A plan suggested fifty years ago by engineer Cornelis Lely forms the basis of the Act for the Enclosure and Partial Reclamation of the Zuiderzee. It specified separating the Zuiderzee from the North Sea with a closed dike, laying out polders around the Zuiderzee, and maintaining large fresh water basins within the enclosure. Border lakes are now being created between the polders and the mainland. These lakes are divided into reservoirs to improve the quality and level regulation of the water. Water quality, especially with regard to salt content, is important since the water washes through the reservoirs and is used for irrigation and for consumption. Such reservoirs also serve as a safeguard for water quality in the event of calamity in the enclosure. In the future, the water supply of the Netherlands may be centralized, using the Zuiderzee area as the largest source of storage. (Grden-North Carolina)

THE ZUIDERZEE WORKS WITHIN THE FRAME OF PHYSICAL PLANNING,
Netherlands Universities Foundation for International Co-Operation, The Hague.
L. Wijers.
Planning and Development in the Netherlands, Vol 4, No 1, p 42-61, 1970. 26 fig.

Descriptors: Reclamation, *Land reclamation, *Optimum development plans, *Comprehensive planning, *Area redevelopment, *Water control, *Land farming, Drainage systems, Sea water, Land use, Urbanization, Long-term planning, Gulfs, Land management, Vegetation establishment, Regional economics, Dikes.
Identifiers: *Netherlands(Zuiderzee), Landscape development, Open plan, Polders, Conurbation, Wieringermeer(Neth), Noordoostpolder(Neth), Oostelijk Flevoland(Neth), Zuidelijk Flevoland(Neth), Markerwaard(Neth).

The reclamation from the sea of the Netherlands' Zuiderzee area adds one-fifth of the country's total surface and shortens the distance between the northern and western parts by one-third. Four polders have been reclaimed sequentially since 1930, with the fifth to be ready by 1980. Through this time sequence, each polder acquires a function determined by the social and economic conditions at its construction time. Using knowledge obtained with each previous polder, State authorities lay dry polders with regard for an optimum physical plan. For example, the recently reclaimed polders provide additional space for urbanization. While plans to build a given number of villages in each polder were drawn up, most were modified by unpredictable conditions. Modifications included reduction in number of villages created, erection of service centers and shifting of agricultural areas. Thereefore, an 'open plan,' concerned with structure, or 'the way in which the parts are arranged with respect to one another' is used. The plan is not static, and while each part will develop a distinct form, this form will not inhibit future development. Course of development is more important than pinpointing the future. Coordination and communication among those dealing with physical planning is also essential for planning a well balanced environment. (Grden-North Carolina)

AGRICULTURAL ASPECTS,
Netherlands Universities Foundation for International Co-Operation, The Hague.
H. Smits.
Planning and Development in the Netherlands, Vol 4, No 1, p 62-78, 1970. 9 photos, 1 tab.

Descriptors: *Agriculture, *Reclamation, *Land reclamation, Land management, *Farm management, Dikes, Canals, Vegetation establishment, Drainage systems, Crops, Evaporation, Permeability, Land use, Soil management, Soil structure, Soil structure, Soil environment.
Identifiers: *Netherlands(Ijsselmeer polders), Block parcelling system, Soil mapping, Lease holding, Tenant farmers, Cooperative farmers, Land allotment, Marine soils, Agricultural Holding Act, Ministry of Agriculture and Fisheries(Neth).

The agricultural aspects of reclaiming the IJsselmeer polders in the Netherlands are integrated with the drainage process of the polder. A dike is erected, and pumping stations are installed. Reeds are sown to promote evaporation. Over a ten-year period, networks for water channels and roads are laid out, subdividing the land into tracts. Optimum lot size is determined by costs of land use and layout. Reclamation begins two to twelve years later with destruction of reed vegetation and preparation of the soil for sowing. The State then farms the land for five years. During this period, soil is improved, farm dwellings are constructed, and electric and telephone cables are installed. Later, the agricultural destination of the land is determined to be grassland farming, arable farming, mixed farming, fruit growing, or horticulture, depending on the soil profile. Land is then allocated to private enterprises of one to four workers. Size of enterprises have been increasing as technical potential and wages have risen. Enterprises growing vegetables and flower bulbs vary in size from 7.4 to 19.7 acres, fruit growing farms from 14.8 to 37 acres. Land is leased for a term of years or on a perpetual long lease. Enterprises may be sold outright in the future. The relationship between gross yield and costs causes reasonable income to be earned. While farmers may manage their lands as they desire, cooperation between enterprises exists with respect to large farming implements and fertilizers. Financial matters are handled mainly by cooperative farmers loan banks. (Grden-North Carolina)

NORTH SLOPE - CONSTRUCTION CRITERIA FOR ROADS AND FACILITIES,
Atlantic Richfield Co., Dallas, Tex.
W. P. Stokes.
Journal of Petroleum Technology, Vol 23, No 10, p 1209-1214, October 1971. 4 fig, 3 tab, 8 ref.

Descriptors: *Arctic, *Cold regions, Construction, *Road construction, *Alaska, Permafrost, Foundations, Drainage, Thawing, Snow, Wind pressure, Gravels, Piles(Foundation), Buildings, Ice.
Identifiers: *North Slope(Alas), Prudhoe Bay(Alas), Sag River(Alas).

The North Slope of Alaska is located in a continuous permafrost zone where the subsurface soils are permanently frozen to depths as great as 2000 feet. The top foot or so of soil - called the active layer - thaws in summer and refreezes in winter. Permanent road construction requires that the road be built in such manner that the insulating tundra cover is preserved intact and undamaged. Consequently, surface grading and side ditching are ruled out. Culverts are installed above the tundra surface. Adequate quantities of gravel are available in the vicinity of Prudhoe Bay. The gravel should be fairly well graded with sufficient fines to act as a binder; yet it must contain less than 3 percent of material finer than 0.02 mm. A 5-ft.-thick gravel fill usually is adequate, although a somewhat thicker layer may be needed to prevent the thaw from extending into the active zone. Buildings, structures, and other facilities must be designed to meet government regulations and operational requirements. Local conditions of wind velocity and snowfall must be considered. Permanent, heated structures are supported on pile foundations with several feet of free air space under the building. Drill sites are covered with a 5-foot layer of gravel. Skid-mounted rigs are used and the skid rails are supported on timbers to allow circulation of air under the drilling rig. All utility lines that are subject to freezing are protected by insulation, heat tracing, or are placed in heated utilidors. (Gray-NWWA)

Identifiers: *USSR, Heat exchange, Traveltime, Hydrometric stations.

Development of river-forecasting procedures is examined in this collection of 9 papers published by the State Hydrologic Institute in Leningrad. Methods are presented for preparation of long-range forecasts of duration of ice phenomena on the Danube River, severity of winters in Central Europe, maximum ice-jam levels of the Severnaya

Dvina River at Arkhangel'sk, maximum flood levels of the Dniester River, and of storm runoff based on precipitation for the Dnieper River. Procedures are described for estimating inflow to reservoirs and for using precipitation data in the preparation of operational forecasts. (See W74-05142 thru W74-05145) (Josefson-USGS)

VEGETATION OF CENTRAL ANATOLIA AND ITS ECOLOGY,
Ankrana Univ. (Turkey). Dept. of Botany.
R. Cetik.
In: Agricultural spects of Arid and Semi-arid Zones, CENTRO seminar, 1972, p. 109-128. 6 fig, 2 tab.

Descriptors: *Vegetation, *Arid climates, *Arid lands, Geomorphology, Grasslands, Orography, Rain, Rainfall, Temperature, Evaporation, Winds, Precipitation(Atmospheric), Rainfall disposition, Snowfall, Plant groupings, Shribs, Riparian plants, Grazing, Grasses.
Identifiers: *Turkey(Anatolia).

The geomorphology of central Anatolia is described as being diverse, with some mountainous regions and intermountain plains. These plains have an arid climate, caused by the deflection of the moisture-bearing winds of Western Anatolia by the surrounding mountains. Temperature distribution in the area is fairly uniform, with significant low temperature extremes in winter and corresponding high temperature extremes in summer months. Winds are associated with annual cycles, often with two predominant directions. Evaporative water loss from the area is found to be from three to four times in excess of the local precipitation. Central Anatolia has a cold and snowy winter, a mild and rainy spring, a less rainy autumn, and a hot and dry summer with a severe arid period. These climatic conditions are mainly responsible for the floral and vegetation of the central plains. Vegetation may be roughly grouped into classes associated with valleys and the steppe. The more moist environment of the valleys lends itself to shrub vegetation, which is thoroughly cataloged, as is the grassland vegetation of the drier steppe. (Muller-Arizona)

Investigations were made on the effect of precipitation, temperature, relative humidity, and wind velocity on the humidity and combustibility of the ground cover of dying-off needles in pine forests (site class V, age class VI, density 0.5) on a glade with grass cover. The effect of each factor is evaluated by a 3-mark scale. The complex effect of meteorological factors and the appearance of fire sources on the territory under guard are also evaluated by 3-mark scales. Results are presented of experimental verification of different methods of determination of fire danger under the conditions of the Kazakh Hills, USSR.--Copyright 1973, Biological Abstracts, Inc.

DENSE LOCAL PLANTATIONS OF PINES IN THE NORTHERN KAZAKHSTAN (IN RUSSIAN),
V. A. Dikorov.
Tr Kaz Nauchno-Issled Inst Lesn Khoz. 7. p 213-223, 1970.
Identifiers: Moisture, Nutrition, *Pines, Plantations, *USSR(Kazakhstan).

Studies were conducted on pine plantations established in 1939-1962 by seed sowing and seedling planting on small plots from 0.2-0.3 x 0.2-0.3 to 3 x 3 m on dry stony soils of the hillocky areas and clearings turned into steppe in the Kustanai, Tselinograd and Kokchetav (USSR) regions. Dense plantations, established by sowing were most practical in places requiring much clearing. Nutrition and moisture reserves were utilized by the biological group (stands) more completely than by single trees. With age, the growth of pine in dense biological groups weakened. Optimum density was 3-5 trees/m2 in a dry pine forest. The spacing of plots at distances of 3 x 5, 5 x 5, 4 x 8 m did not result in a stable biocenosis; the size of the plots should not exceed 1 m2, the optimum size being 0.5 x 0.5 m with 1000 plots/ha. Natural root grafting in the biological groups was a frequent phenomenon but it did not affect tree growth.--Copyright 1973, Biological Abstracts, Inc.

THE ECONOMIC EFFICIENCY OF INTER-BASIN AGRICULTURAL WATER TRANSFERS IN UTAH: A MATHEMATICAL PROGRAMMING APPROACH,
Water Research Lab., Logan.
J. E. Keith, J. C. Anderson, and C. G. Clyde.
PRWG100-3, Utah Water Research Laboratory, College of Engineering, Utah State University, Logan, Utah, June 1973. 51 fig, 16 tab, 40 ref, 5 append, 136 p.

Descriptors: *Water supply development, *Economic efficiency, *Inter-basin transfers, *Water allocation(Policy), *Utah, *Agriculture, *Water demand, Computer models, Optimization, Linear programming, Marginal costs, Value, Municipal water, Industrial water, Wetlands, Water requirements, Systems analysis.

Identifiers: *Central Utah Project, Jordan River Basin(Utah).

The efficient allocations of agricultural water in Utah in time frames up to 2020 under several alternative assumptions are examined, and the costs of alternative policies are calculated. Using mathematical programming techniques, a computer model is developed to determine the supply (marginal cost) and demand (value of marginal product) relationships for agricultural water, given depletions for municipal and industrial (M and I) and wetland requirements. The model maximizes net profit per acre to an average agriculturalist in each of ten study areas in Utah. Proposed interbasin transfers and their costs are included in supply. The optimal solution generated is an efficient allocation, since maximization of net profits occurs only when value of marginal product equals marginal cost. Requirements for M and I water are projected into the future, using trending and probable industrial development. Timing of investments in water distribution systems can be determined from the model solutions. Using alternative assumptions about policies, several optional temporal distributions are determined. The effect of restrictions on groundwater pumping is examined. Costs to users in higher supply curves (marginal costs) are approximated by areas between supply curves. Losses to agricultural users from diminished efficient new production can be approximated. The critical factors in large proposed water transfers in Utah appear to be the growth of M and I requirements along the Wasatch Front, particularly in the Jordan River Basin. (Bell-Cornell)

MODELS OF WATER SUPPLY SYSTEMS,
Karlsruhe Univ. (West Germany). Institut fuer Siedlungswasserwirtschaft.
R. G. Cembrowicz.
In: Models for Environmental Pollution Control (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Mich., p 157-179 (Chapter 7), 1973. 1 fig, 2 tab, 51 equ, 30 ref.

Descriptors: *Water supply development, Projects, *Design, *Optimization, *Alternative planning, *Mathematical models, Cost-benefit analysis, Linear programming, Networks, Hydraulics, Water distribution(Applied), Water treatment, Systems analysis.
Identifiers: *Cost minimization, Geometric programming, Nonlinear programming, Capacity expansion, Unit processes, Tree networks, Decomposition techniques.

The optimal design of water supply systems is considered, with several specific parts of the overall water supply system treated in detail. Inherent difficulties exist in comparing costs of water supply systems to the benefits of ample and safe supply; the problem of a cost-benefit analysis for water supply projects is discussed. Next, if fresh water is scarce or water demands exceed accessible resources, an investigation of all possible supply alternatives in an entire region becomes necessary. Mathematical programming techniques for selecting different sources and the least-cost combination of alternate sources are considered. Next, the focus is on the optimization of unit processes in a water treatment plant; geometric programming is introduced and applied to the hydraulic design of sedimentation tanks. Then, the economically optimal design of the water distribution system is investigated; discussed is the tree principle, and the transformation of the nonconvex capital cost function of a hydraulic network to subsets of nonlinear convex functions by a decomposition position principle from graph theory is described. Finally, a model for the capacity expansion of a water supply system is presented. (Bell-Cornell)

4B. Groundwater Management

SYSTEMATIC DESIGN OF LEGAL REGULATIONS FOR OPTIMAL SURFACE-GROUNDWATER USAGE--PHASE 1,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
H. J. Morel-Seytoux, R. A. Young, and G. E. Radosevich.
Available from National Technical Information Service as PB-228 649 $7.50 in paper copy, $1.45 in microfiche. Colorado State University Environmental Resources Center, Completion Report Series No 53, August 1973, 81 p, 3 fig, 3 tab, 53 ref. OWRR B-076-COLO(2).

Descriptors: Groundwater, *Surface-groundwater relationships, *Regulations, Law, *Optimization, *Water management(Applied), *Conjunctive use.

The purpose is to model the legal restrictions and the hydrologic constraints imposed by conjunctive use, and develop criteria for legal rules that utilize information on aquifer parameters, snowmelt runoff, etc. Legal and institutional methods and limitations concerning the conjunctive and integrated use of ground and surface water resources are examined. Legal schemes developed by the states of Colorado and New Mexico for conjunctive use are discussed, together with a cursory examination of the situations in Texas and California. The doctrine of prior appropriation is discussed in relation to its initial development in the western states for the purpose of controlling the appropriation of surface water to its evolution and modification to control conjunctive use. The Colorado system places more stress upon the concept of establishing some common basis for surface and groundwater rights while the New Mexico procedure makes the existence of one dependent upon the retirement of the other. Both systems are characterized by a singular absence of specific requirements; instead broad regulatory powers are created. California has devised a different solution to integrated use due to its complex dual system of water rights. Texas will be faced with a highly complex situation due to adherence to the English rule that a landowner owns the water under his land and cannot be denied the right to produce his groundwater even if it infringes upon neighboring rights. Western states are finally recognizing the need for integrated use of ground and surface water; the Fellhauer case required the integration of vested rights with maximum utilization.

ENVIRONMENTAL GEOLOGY AND HYDROLOGY, MADISON COUNTY, ALABAMA: WATER RESOURCES,
Geological Survey, University, Ala. Water Resources Div.
K. E. Vanlier, R. C. Christensen, R. J. Faust, and W. F. Harris, Jr.
In: Geological Survey of Alabama Atlas Series 1, p 13-28, 1971. 13 ref.

Descriptors: *Water resources, *Alabama, Groundwater, Surface waters, Urbanization, Karst hydrology, Water demand, Water supply, Geology, Maps.
Identifiers: *Huntsville(Ala).

The demands of the increased population upon the natural resources of Madison County, Alabama, are at an all-time high; so is the volume of waste produced. Informed use of the land, water, and mineral resources, based on scientific facts, is necessary for Alabama's third-largest urban area and its environs. This study has been directed at supplying basic facts about the resources of the area and their conservation to aid in adequate city and urban planning for the future. Water, oil and gas and minerals such as limestone, sand, gravel, and clay for construction are the most important raw materials for industrial development in the area. In general, Alabama has great and unexplored reserves of these resources that are relatively undeveloped. In Madison County, a thick sequence of limestone beds underlie the area. Some of these formations are relatively pure limestone that has been gently folded and fractured. Fracture openings in limestones are enlarged by solution, forming large storage reservoirs underground for water and an extensive labyrinth of channels along which groundwater can move. These groundwater reservoirs, when tapped effectively by wells and managed properly, are capable of supplying many billions of gallons of water to the area to meet its water needs. Wells are an important source of water supply. The yields from these wells range from about 5 to more than 100 gpm. Most wells in the quadrangle supply household needs, which require only a few gallons per minute. Several wells yielding 100 gpm or more are used for industrial, agricultural, and public supply. (Knapp-USGS)

WATER-RESOURCES APPRAISAL OF THE BIG SANDY AREA, MOHAVE COUNTY, ARIZONA,
Geological Survey, Phoenix, Ariz.
E. S. Davidson.
Arizona Water Commission Bulletin 6, December 1973. 40 p, 4 fig, 2 tab, 17 ref.

Descriptors: *Water resources, *Arizona, *Groundwater, *Surface waters, Alluvial channels, Hydrologic data, Hydrogeology, Aquifers, Water yield.
Identifiers: *Big Sandy River(Ariz).

The central valley of the Big Sandy River, Arizona, is underlain by several hundred to a few thousand feet of semiconsolidated to unconsolidated deposits that store large amounts of groundwater; the principal water-yielding units are stream and flood-plain alluvium, the upper basin fill, the lower basin fill, and the arkosic gravel. The depth to groundwater below the land surface ranges from less than 1 foot in places along the Big Sandy River to 750 feet in the northern part of the area. The mean annual precipitation ranges from 10 inches in the central valley to 20 inches in the mountains and is equivalent to about 1 million acre-feet of water in the 1,770-square-mile drainage basin of the Big Sandy River upstream from the granite gorge near Wikieup. About 4.6% of the precipitation leaves the area as surface-water and groundwater outflow; the rest of the precipitation is lost to evaporation or is transpired by vegetation. In general streamflow is intermittent and occurs only in response to precipitation or snowmelt. Groundwater and surface water generally are of good chemical quality except for the high fluoride content. The average surface-water outflow is about 24,900 acre-feet per year. The total groundwater outflow--which comprises evapotranspiration in an area of dense riparian growth, consumptive use for irrigation and public supply, and underflow--is about 21,500 acre-feet per year. Only a few thousand acre-feet of water per year is used by the inhabitants in the area, and the available water resources will support considerable additional development. (Knapp-USGS)

WORTH OF DATA USED IN DIGITAL-COMPUTER MODELS OF GROUND-WATER BASINS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
J. S. Gates.

Available from the National Technical Information Service as PB-228 854, $15.00 in paper copy, $1.45 in microfiche. Technical Report No. 8, June 1972. 214 p, 11 fig, 16 tab, 40 ref, append. OWRR B-007-ARIZ(26) and A-010-ARIZ(22). 14-01-0001-1876, 14-31-0001-3708.

Descriptors: *Groundwater, *Computer models, Recharge, Statistical models, *Forecasting, Network design, *Risks, *Well data, Pumping.
Identifiers: Bayesian decision theory, Groundwater pumping, Model evaluation, Uncertainty analysis.

The worth of additional data to a digital model of the Tucson basin, Arizona was computed using a basic form of statistical decision theory (Bayesian). The model variables for which additional data were hypothesized included the aquifer coefficients of storage and transmissivity, initial water levels, discharge, and recharge. The worth of data was evaluated in terms of the expected reduction in error in predicted water levels associated with collection of more data on one variable at one point in the model. A limited number of tests suggested that the Tucson basin model could be improved most by obtaining more data on discharge and recharge in areas where these variables were large, and by obtaining more data on transmissivity where it was uncertain. More data on initial water levels and storage coefficient commonly were less helpful. The sensitivity of the results to the assumptions made in postulating discrete frequency distributions with largely subjectively-determined parameters for the model variables was estimated. These tests indicated that the numerical values for worth of data were sensitive to the assumptions, but that the relative rankings of variables in terms of worth of added data remained constant.

GROUND-WATER RESOURCES OF THE SAN ANTONIO AREA, TEXAS: A PROGRESS REPORT ON STUDIES, 1960-1964,
Geological Survey, Austin, Tex.
S. Garza.
Texas Water Development Board, Report 34. November, 1966. 31 p, 11 fig, 4 tab, 33 ref.

Descriptors: *Aquifer characteristics, *Limestones, Surface-groundwater relationships, Water sources, Water table, Saline water intrusion, Reservoirs, Streams, Wells, *Texas.
Identifiers: *Edwards Aquifer(Tex.), *San Antonio(Tex.), Aquifer head-water movement relationships, Edwards Plateau(Tex.).

This report updates through 1964 hydrologic data on the Edwards and associated limestones, which is the principal ground-water reservoir (aquifer) for the San Antonio area. Records of precipitation, streamflow, and water level are included, as well as estimates of recharge to and discharge from the aquifer. The base flow of the streams that drain the Edwards Plateau is spring flow from a water-table aquifer in the plateau. Recharge is primarily from stream seepage, and through direct infiltration of precipitation on the outcrop of the aquifer. Between 1934-1964, average annual recharge was estimated to be almost 500,000 acre-feet. Most of the 1934-1964 discharge from the aquifer was from springs, exceeded by discharge from wells only between 1954-1957 and 1963-1964. In 1964 discharge from springs was nearly 214,00 acre-feet, while discharge from wells exceeded 267,000 acre-feet. Low water levels prevailed between 1947-1956, due to drought and increased withdrawals from wells throughout the San Antonio area. Recharge from heavy rains between 1957-1961 increased water levels to approximately pre-drought levels. Also included are analyses on the relation of the aquifer head to changes in water movement and storage and a summary of studies on water quality in the zone of transition between water of good quality and saline water in the aquifer. PULSE-TEST RESPONSE OF A TWO-ZONE RESERVOIR,
Esso Production Research Co., Houston, Tex.
E. G. Woods.
Society of Petroleum Engineers Journal, Vol 10, No 3, p 245-256, September, 1970. 12 fig, 5 tab, 15 ref.

Descriptors: *Transmissivity, *Storage coefficient, *Aquifer characteristics, *Mathematical models, Diffusivity, Drawdown, Flow Permeability, Porosity.
Identifiers: *Pulse test, *Well pair, *Two-zone reservoir, Cross flow, Skin factor, Buildup.

A mathematical study was undertaken to determine what errors could be caused by interpreting pulse tests in a multi-zone reservoir with a single-layer model. The investigation of the pressure response of two-zone reservoirs indicates the apparent transmissibility obtained by pulse testing is always equal to or greater than the total transmissibility of the zones. Apparent storage is always equal to or less than the total storage of the zones. These apparent zone properties approach total properties as vertical fluid communication between zones increases. The presence of non-uniform wellbore damage in the zones alters the division of flow between zones, and consequently, alters their apparent transmissibility ratio. The flow-rate ratio is a good estimator of the transmissibility ratio of the zone in the absence of wellbore damage. A numerical example is given of the use of a procedure, based on the differences of reservoir properties determined by single-well tests and pulse tests, to describe flow properties of two-zone reservoirs. CHEMICAL ASPECTS OF UNDERGROUND WATER,
Commonwealth Scientific Industrial Research Organization, North Ryde (Australia). Div. of Mineralogy.
D. J. Swaine.
In: NWWA International Groundwater Symposium on 'Groundwater-the Forgotten Resource', November 20-22, 1973, held at Macquarie University, Sydney, Australia. 5 p, 4 ref.

Descriptors: Groundwater, *Groundwater movement, *Geochemistry, *Trace elements, Chemical properties, Exploration, Mining, *Water quality, Salinity, Organic wastes, Solid wastes, *Sulfur bacteria, *Australia.
Identifiers: Perth(Aust.), Interstitial water.

The assumption is made that groundwater is a resource which will be used in increasingly large amounts in the future. There is at present insufficient knowledge of the trace-element composition; of the processes determining the composition; and of the causitive physical and chemical processes of underground waters. Discussed in some detail are: Origin of salts in groundwater, reactions between rocks and saline solutions, the relevance of underground waters to mineral exploration, and groundwater in the geochemical cycles of trace elements. Also discussed are processes which if operative could be instrumental in determining groundwater quality, such as the decomposition of organic matter and the action of sulphate-reducing bacteria. GROUNDWATER IN PAPUA NEW GUINEA,
Geological Survey of Papua New Guinea, Port Moresby.
G. Jacobson, and C. H. Kidd.
In: NWWA International Groundwater Symposium on 'Groundwater-the Forgotten Resource', November 20-22, 1973, held at Macquarie University, Sydney, Australia. 16 p, 6 fig, 1 tab, 8 ref.

Descriptors: *Groundwater, *Aquifer characteristics, Water resources development, Springs, Wells, *Groundwater availability, Dug wells, *Water pollution sources.
Identifiers: *Papua New Guinea, Total dissolved solids, Bacterial contamination.

Groundwater makes a significant contribution to the urban and rural water supplies of Papua New Guinea. Eight hundred water bores and dugwells have been recorded, and there are spring developments throughout the country. Increased future usage of groundwater is necessary because of bacterial contamination of surface waters and the seasonal nature of the rainfall in some areas. Groundwater availability is largely unknown, and the need for reconnaissance surveys and detailed aquifer evaluations is discussed with the aid of a groundwater potential map. Finance is at present a major limiting factor to groundwater development, with government drilling programs appearing to be the only workable solution. (Staplin-NWWA)

PRESSURE INTERFERENCE EFFECTS WITHIN RESERVOIRS AND AQUIFERS,
Standard Oil Co. of California, San Francisco.
T. D. Mueller, and P. A. Witherspoon.
Journal of Petroleum Technology, Vol 17, No 4, p 471-474, April, 1965. 4 fig, 5 ref.

Descriptors: *Aquifers, Groundwater reservoirs, *Diffusivity, *Reservoirs, *Pressure, Flow, Head loss, Theis equation.
Identifiers: *Mortada equation, Point source, Well interference.

The solutions of Theis and of Mortada to the Calculation of pressure conditions within a reservoir or aquifer are reviewed. Graphs were prepared of dimensionless pressure drop vs. dimensionless time for radius ratios from one to infinity to afford solutions to the diffusivity equation for the infinite radial case at constant terminal rate. The Theis, or point source, solution can be used for radius ratios greater than 20, with little error (as shown by ex-

amples). For low radius ratios, the solution of the diffusivity equation given may be preferred. A chart provides a means of determining the order of the errors that will result through the use of the Theis equation. In the calculation of interference effects in an aquifer, a substantial error can occur when the Theis solution is used, although in oil-reservoir calculations the error is often negligible. BOREHOLE GEOPHYSICS AS APPLIED TO GROUNDWATER,
Geological Survey, Denver, Colo.
W. S. Keys.
In: Proceedings of the 2nd Annual Water Well Seminar for Professional Engineers, March 22, 1973, Columbia, S.C.: South Carolina Water Resources Commision, p 46-73, 1973. 6 fig, 1 tab.

Descriptors: *Borehole geophysics, *Data collections, Hydrologic data, Hydrogeology, Electrical well logging, Radioactive well logging, Subsurface investigations.

Borehole geophysics or well logging includes all techniques of lowering a sensing device in a well to make a record which may be interpreted in terms of the rock characteristics, contained fluids, and the construction of the well. The single most important factor in the present minor use of geophysical logging in water wells in cost. As a result of recent developments in electronics, small and relatively inexpensive logging units that can be operated by one man are now available. A second basic deterrent to the widespread use of geophysical well logs in groundwater is that few professional geologists, hydrologists, or engineers are working on water well drilling projects. In addition, most drillers, municipal water engineers, or hydrologists do not have the experience necessary to interpret geophysical logs. Therefore interpretation must be provided along with logs, if logging is to have much practical application to the solution of hydrologic problems. (Knapp-USGS)

EVALUATION OF GROUND-WATER DATA,
Geological Survey, Atlanta, Ga.
A. N. Turcan, Jr.
In: Proceedings of the 2nd Annual Water Well Seminar for Professional Engineers, March 22, 1973, Columbia, S.C.: South Carolina Water Resources Commission, p 18-28, 1973. 3 tab, 8 ref.

Descriptors: *Data collections, *Hydrologic data, *Hydrogeology, Water resources development, Planning, Water management(Applied), Conferences, *Groundwater managment.

In design and evaluation of a groundwater data system, thinking must not be limited to one part of the hydrologic system. The line between ground and surface water is indistinct; it is not a line, but a continuum that varies in relation to time and space. Groundwater becomes surface water and vice versa. The hydrologic system is dynamic, thus network design must be flexible and always subject to change based upon the changes in economy, available manpower, and new thrusts or problems, such as storage of waste in the deep zones as well as the shallow zones of the underground part of the system. (Knapp-USGS)

COLLECTION OF GROUNDWATER DATA,
Georgia Inst. of Tech., Atlanta.
P. G. Mayer.
In: Proceedings of the 2nd Annual Water Well Seminar for Professional Engineers, March 22, 1973, Columbia, S.C.: South Carolina Water Resources Commission, p 12-17, 1973.

Descriptors: *Data collections, *Hydrologic data, *Hydrogeology, Water resources development, Planning, Water management(Applied), Conferences, *Groundwater management.

A local data base is needed for groundwater development as well as an appreciation of regional implications that may exist either as limiting to the desired engineering results or as an undesirable consequence of an engineering project. The usual purposes to which engineers and planners address themselves in connection with groundwater resources are water supply wells, infiltration galleries, groundwater recharging wells, and infiltration ponds. In larger industrial developments it may also be necessary to develop groundwater observation wells and groundwater monitoring systems, by means of which the fate of potential pollutants can be monitored and which, in the case of an unforeseen accident, provide the basis for remedial measures. GROUNDWATER CONDITIONS OF THE TARAI REGION,
Pant Coll. of Tech., Pantnagar (India).
A. K. Bhar, H. S. Seth, and A. K. Ghosh.
Indian Geohydrology, Vol 9, No 1, p 19-30, June 1973. 1 fig, 3 tab, 6 ref.

Descriptors: *Water balance, *Groundwater, *Water yield, Irrigation water, Infiltration, Discharge(Water), Water resources development, Hydrogeology, Artesian aquifers, Water table.
Identifiers: *India(Tarai region).

In the groundwater of the Tarai region of India, every year a surplus of water accumulates in the upper unconfined aquifers, whereas the inflow to the confined aquifers just balances the outflow from them. This suggests that further exploitation of water from confined aquifers should be stopped at least for the time being, and additional water required for irrigation can be safely tapped from the unconfined aquifers. SPACING OF HARD ROCK SHALLOW WELLS,
Osmania Univ., Warangal (India). Regional Engineering Coll.
N. T. Zhdankus.
Indian Geohydrology, Vol 9, No 1, p 1-9, June 1973. 2 fig, 4 ref.

Descriptors: *Water wells, *Water yield, *Hydrogeology, Economics, *Water costs, Hydraulic conductivity, Transmissivity, Data collections.
Identifiers: *India.

Optimum spacing and number of wells depend on hydrogeological conditions. Suitable methods for the determination of optimum spacing of shallow hard rock wells and selection of suitable pumps for them were developed on the basis of hydraulic and economical considerations. Shallow aquifers in hard rock areas of India are characterized by low hydraulic conductivity and transmissivity. Location of each well should be determined individually on the basis of geophysical data and interpretation of local topographical and geological conditions. Sharp variation of productivity of even closely situated wells in hard rock areas shows that hydrogeological parameters of such formations are inconsistent, varying within broad limits without any pronounced order. GEOTHERMAL RESOURCE INVESTIGATIONS, IMPERIAL VALLEY, CALIFORNIA: SPECIAL REPORT TEST WELL MESA 6-1.
Bureau of Reclamation, Denver, Colo. Lower Colorado Region.
February 1973. 44 p, 17 fig, 3 photo, 7 tab, 3 ref.

Descriptors: *Geothermal studies, *Water wells, Thermal water, *California, Thermal powerplants, Water yield, Wells.
Identifiers: *Geothermal energy, *Imperial Valley(Calif).

The Bureau of Reclamation and the Office of Saline Water are exploring the geothermal resources under Reclamation-withdrawn lands in Imperial Valley, California. A deep geothermal test well was drilled in Imperial Valley, California. Total depth of 8,030 feet was reached on August 16, 1972. The well began to flow geothermal liquid and steam on August 25, 1972 and flowed for an aggregate total of 66 days to January 24, 1973. A series of temperature, pressure, quality, and flow measurements were made during that period. Surface plumbing facilities, including a separator, silencer, and weir, were installed to separate the steam and liquid and to accurately determine the thermodynamic characteristics of the geothermal fluid. The water is typical geothermal fluid. It is predominantly sodium-potassium and chloride water, with the amount of silica being at the saturation point for the prevailing temperature. In the interval between 2,500-7,150 feet in Mesa 6-1, it would be possible to screen potential producing zones having intergranular permeabilities in excess of 100 millidarcys over an aggregate thickness of 1,232 feet. (Knapp-USGS)

GROUNDWATER RESOURCES OF THE VALE OF CLWYD.
Water Resources Board of England and Wales.
Publication No 20, 1973. 58 p, 32 fig, 10 tab, 15 ref, 3 append.

Descriptors: *Conjunctive use, *Hydrogeology, Aquifer characteristics, Aquifer testing, Water yield, Drawdown, Surface-groundwater relationships, Water balance.
Identifiers: *Wales(Vale of Clwyd).

The hydrogeology of the Vale of Clwyd, Wales, and the relationship between the surface hydrology and groundwater conditions are described. Up to 20,000 cu m per day could be made available by continuous direct supply from boreholes, but any such perennial abstraction would in the long term reduce flows in the river Clwyd; at least 30,000 cu m per day could be made available for supply if the groundwater storage were to be used to regulate the river Clwyd, and such a development would enhance the low flows in summer and autumn over much of the river. (Knapp-USGS)
W74-05168

WATER RESOURCES OUTLOOK FOR THE MINNEAPOLIS-SAINT PAUL METROPOLITAN AREA, MINNESOTA,
Geological Survey, St. Paul, Minn.
R. F. Norvitch, T. G. Ross, and A. Brietkrietz.
Metropolitan Council of the Twin Cities Area, St. Paul, 1973. 219 p, 59 fig, 27 tab, 64 ref, append.

Descriptors: *Groundwater, *Hydrogeology, Aquifer characteristics, *Minnesota, Hydrologic data, Aquifers, Water resources development, Cities, Water management(Applied), Water wells, Water yield, Urbanization.
Identifiers: *St. Paul(Minn), *Minneapolis(Minn).

The water resources of St. Paul and Minneapolis were studied within an area whose natural groundwater flow is largely towards the center of the

metropolitan area. This area coincides with the extent of the Hinckley Sandstone aquifer. Greater emphasis is placed on the area underlain by the Prairie du Chien-Jordan aquifer (about 2,000 square miles), from which approximately 75% of the groundwater for the metropolitan area is pumped. The surface-water resources of the Twin Cities metropolitan area are used to such an extent that a supply adequate for domestic and industrial needs as well as powerplant and sanitary effluent assimilation will not be available during severe drought. Groundwater is obtained primarily from two aquifer systems: The Prairie du Chien-Jordan and the Mount Simon-Hinckley. In 1970, these aquifers supplied about 90% (175 mgd) of the groundwater used in the metropolitan part of the study area. The probable level of development that can be sustained by these two aquifers in the metropolitan area is estimated to be 1,100 mgd; thus, substantial additional groundwater supplied could be developed. However, considerable management and planning would be needed to sustain this level of development. Maps in this report can be used to select general well-field locations based on consideration of (1) aquifer, (2) depth needed for completion, (3) head availability, (4) location of natural recharge and discharge boundaries, and (5) distance from areas where over-development of groundwater resources is imminent. GROUNDWATER IN THE NORTHERN WISO BASIN AND ENVIRONS, NORTHERN TERRITORY,
Bureau of Mineral Resources, Geology and Geophysics, Canberra (Australia).
M. A. Randal.
Bulletin 123, 1973. 141 p, 23 fig, 1 plate, 15 tab, 65 ref, 7 append.

Descriptors: *Groundwater, *Hydrogeology, *Australia, *Aquifers, Water yield, Geomorphology, Water quality, Groundwater movement.
Identifiers: Wiso Basin(Australia).

Groundwater resources were studied in the northern Wiso Basin in the central part of the Northern Territory of Australia. Because of seasonal and sparse rainfall the surface water resources of the region are meager, and both pastoral and community development are largely dependent on the availability of groundwater of reasonable quality. The region comprises three Palaeozoic basins of mainly carbonate rocks and their surrounding Lower Cambrian and Precambrian basement rocks. From a groundwater point of view the most important of the basement rocks are Lower Cambrian volcanics, which crop out in the west and extend subsurface considerable distances eastward. Most of the groundwater is obtained from the carbonate sequences. Over large parts of the region these sequences are overlain by flat-lying Lower Cretaceous rocks which have a profound effect on the groundwater regime. Geomorphology also is important to the groundwater regime. The region is a gently undulating plateau which slopes northward and is bounded by the dissected country of the main coastal river system; depth to economic quantities of water is governed by the depth below the surface of suitable aquifers, and throughout the plateau these are generally deeper than on its dissected margins. Throughout the entire region the known groundwater reserves are suitable for stock; only in a few places is the quality below domestic standards. The groundwater resources are more than adequate for the present pastoral and community development. Although rainfall is low in the southern parts the probable recharge areas are very large and the withdrawal rate is very low. In the north rainfall is high and recharge situations extensive. (Knapp-USGS)
W74-05331

EXTENSIVE PUMPING FROM UNCONFINED AQUIFERS,
Birmingham Univ., (England). Dept. of Civil Engineering.
K. R. Rushton.
Water Resources Bulletin, Vol 10, No 1, p 32-41, February 1974. 5 fig, 2 tab, 5 ref.

Descriptors: Water resources development, *Water yield, *Groundwater movement, *Numerical analysis, Drawdown, *Withdrawal, Mathematical models, Water table, Recharge, *Pumping.

Heavy pumping of an aquifer to remove a significant proportion of the stored water is considered using a numerical method which permits the analysis of radial flow to a well in an unconfined aquifer and allows for the reduction in the saturated depth. The analysis is restricted to extensive unconfined aquifers of constant thickness which are initially full of water with wells positioned on a square grid. When the aquifer is recharged with the recharge equaling the discharge, it is possible that a steady state will be reached with the heads remaining constant with time. Withdrawal of a large proportion of the available water from an unconfined aquifer requires carefully controlled pumping. If the discharge rate is too high, the pump will quickly run dry and only a very small proportion of the water will be withdrawn. (Knapp-USGS)

COMPARATIVE COSTS OF EROSION AND SEDIMENT CONTROL, CONSTRUCTION ACTIVITIES.
Engineering-Science, Inc., Berkeley, Calif.
Copy available from GPO Sup Doc as EP1.23:430/9-73-016, $2.20; microfiche from NTIS as PB-229 480 $1.45. Environmental Protection Agency, Washington, D.C., Office of Water Program Operations, Report EPA-430/9-73-016, July 1973. 205 p, 60 fig, 140 ref. EPA Contract 68-01-0755.

Descriptors: *Erosion control, *Sediment control, *Comparative costs, *Construction costs, *Soil erosion, *Estimated costs, Erosion rates, Cost analysis, Rainfall intensity, Water pollution, Water pollution sources, Water clarification, Soil conservation, Dredging, Desilting, California, Virginia.
Identifiers: *Universal soil loss equation, Occoquan Creek Basin(Virginia), Walnut Creek Basin(California), Rainfall erodibility index, Debris basins.

Cost information on erosion and sediment control measures was developed for over 25 methods in current widespread use in both the humid Eastern and arid Western United States. Most of the data presented were developed for the Walnut Creek Basin in California and the Occoquan Creek Basin in Virginia, but the detailed cost estimates presented provide a basis for estimating local costs elsewhere for similar control methods using three principal cost elements: labor, equipment and materials. Soil losses were estimated by using the improved universal soil loss equation. The rainfall erosion index in the soil loss equation was intensively studied, and simplified procedures for its computation were developed and presented. Cost data were applied to theoretically-predicted soil losses in both of the selected watersheds to obtain comparative costs per cubic yard of soil retained for conservation measures, and similar costs for various sediment removal methods. Control effectiveness parameters and economic life of each method were used to determine comparable annual cost figures. A central conclusion of the study was that costs of preventing erosion are, in many instances, lower than the direct costs of removing sediments from downstream areas or from water supplied. (EPA)

A SUMMARY REPORT ON THE STUDY OF LAND AND WATER RESOURCES IN NORTHEAST GREENWICH, CONNECTICUT.
Conservation Foundation, Washington, D.C.
Prepared for the Town of Greenwich, Connecticut, May, 1973. 22 p, 14 fig.

Descriptors: *Water supply, *Connecticut, *Conservation, Environmental effects, *Watershed management, Planning, *Water demand, Ecology, Geology, Hydrology, Soils, Connecticut, Urbanization, Zoning, Natural resources.
Identifiers: Open space, *Greenwich(Conn.), Natural processes.

Part of the town of Greenwich which is of vital concern in terms of protection from urban development pressures is the water supply watershed representing most of the remaining open area within the town. The aqueduct from the Mianus River Reservoir in Stamford is the other major source of water. Intended to provide information needed to make recommendations and decisions concerning the use and development of this area, this study focuses on a corridor of wetlands and streams within the watershed and covers bedrock geology, surficial geology, ecology, hydrology, and soils. Emphasis is placed on identifying natural conditions and processes and the interrelationships among these processes or environmental subsystems. The findings of the study are grouped according to those relating to water supply, to water demands, and to the protection of resources. The town's demand for water has increased 50% in the past 10 years and the watershed, especially the central corridor, is a critical element in meeting the demand. It is proposed that in the central corridor area no residential development be allowed on poor soils, on steep slopes, or within 200 feet of streams, lakes, and wetlands. Recommendations include the use of zoning ordinances, the State Inland Wetlands Act, and the Town Plan. (Elfers-North Crolina)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

TRACE SOLUABLE ORGANIC COMPOUNDS IN POTABLE WATER SUPPLIES,
Iowa State Univ., Ames. Dept. of Chemistry.
H. J. Svec, J. S. Fritz, and G. V. Calder.
Available from National Technical Information Service as PB-228 523 $4.50 in paper copy, $1.45 in microfiche. Iowa Water Resources Research Institute, Ames, Report ISWRRI - 54, January 1974. 23 p, 2 fig, 3 tab, 11 ref. OWRR A-046-IA(1).

Descriptors: *Organic compounds, Aqueous solutions, *Potable water, *Analytical techniques, Resins, *Solvent extractions, Gas chromatography, *Water analysis, Mass spectometry, Iowa, Nebraska.
Identifiers: Macroreticular resins, *Trace organic analysis.

An analytical method has been developed for concentrating, extracting, separating, and identifying natural organic compounds present in sub parts-per-million quantities in potable water. The developed technology consists of extracting trace organic compounds from water by means of macro-reticular resins, eluting them by simple and rapid solvent methods, separating the mixtures by gas chromotography, and identifying and quantifying the various pollutants by combination gas chromotography mass spectometry. The experimental XAD-2 method was compared to the standard EPA approved solvent extraction method for determining chlorinated pesticides in water and showed it to be more effective, even at parts-per-trillion levels, in recovering dieldren from river water. More than 150 compounds were identified (in about half of these cases even the specific isomer was identified) in the raw and/or treated water from fifteen Iowa and Nebraska communities. In several cases the raw water had fewer contaminants than the treated water. Presumably the additional contamination resulted from contact with treatment equipment or organic coatings (tar or asphalt) used to prevent corrosion of the iron conduits used to transport the water to consumers. (Cecil-Iowa)

SELECTIVE CHROMATOGRAPHIC SEPARATION OF URANIUM(VI) ON DEAE-CELLULOSE LAYERS IN DILUTE ACETIC ACID MEDIA,
Chiba Univ. (Japan). Lab. for Analytical Chemistry.
R. Kuroda, K. Oguma, and H. Watanabe.
Journal of Chromatography, Vol 86, No 1, p 167-172, November 1973. 1 fig, 2 tab, 19 ref.

Descriptors: *Cellulose, *Separation techniques, Ions, Acids, Chromatography, Beryllium, Magnesium, Aluminum, Calcium, Titanium, Chromium, Zinc, Cadmium, Manganese, Iron, Cobalt, Nickel, Copper, Strontium, Lead, Molybdenum, Gold, Mercury, Ion exchange.
Identifiers: *Uranium, *Thin layer chromatography, Acetic acid, DEAE-cellulose, Indium, Vanadium, Gallium, Ruthenium, Scandium, Barium, Yttrium, Thallium, Thorium, Zirconium, Tin, Antimony, Tellurium, Bismuth, Rhodium, Arsenic, Germanium, Columbium, Silver, Tungsten, Iridium, Rhenium, Platinum, Selenium, Elution.

In dilute acetic acid solutions, U(VI) shows a useful chromatographic distribution on DEAE-cellulose layers, while most other metals ions migrate upwards to the solvent front or remain at or near the start. This chromatographic behavior of U(VI) enables a selective method for the separation of U(VI) by thin-layer chromatography to be developed. The R sub f values on DEAE-cellulose and Avicel SF are quoted for 34 metal ions as a function of acetic acid concentration in the range 1-6 M. Results for two- and three-component separations by elution with 1 M acetic acid are given in order to illustrate the effectiveness and utility of the present method. (Mortland-Battelle)

Journal of Chromatography, Vol 86, No 1, p 159-165, November 1973. 1 fig, 2 tab, 8 ref.

Descriptors: *Chromatography, *Aromatic compounds, Acids, *Organic acids, *Pollutant identification, Organic compounds.
Identifiers: *Nitriles, *Paper chromatography, Dinitriles, Diamides, Carboxylic acid, Cyanobenzoic acid, Dicarboxylic acid, Tricarboxylic acid.

A procedure involving reaction paper chromatography for the determination of the number of nitrile groups in molecules from the shift in the R sub M values of the substance before and after reaction has been developed. A technique for the detection of substances with a nitrile group, which can be used with advantage even for other substances, has been devised. To 1 ml of 15-20 percent hydrogen peroxide, 1-2 drops of 15 percent aqueous NaOH solution and several milligrams of a sample of a substance containing a nitrile group were added. The mixture was shaken and filtered after 2-3 min, and the residue on the filter was dissolved in either dimethyl sulphoxide or ethanol. The solution obtained was applied directly on to the chromatographic paper as a 5 percent solution. The substances were chromatographed on Whatman No. 3 paper using n-propanol-ammonia (2:1) as the solvent. The detection was carried out by spraying with two reagents. The first reagent was prepared by mixing 5 g of hydroxylamine hydrochloride with an equivalent amount of anhydrous sodium carbonate and adding 200 ml of 96 percent ethanol. After stirring, the solution was filtered and the filtrate was used for spraying. The second reagent was a saturated aqueous solution of copper(II) acetate. The chromatogram was sprayed with the first reagent and, after drying either freely in the air or in an oven at 80C, it was sprayed with the second reagent. The coloration of the spots was observed immediately under UV light. Some substances fluoresced brightly in various colors, and some were visible even under normal light. (Mortland-Battelle)

INTERFACING A PROGRAMMABLE ELECTRONIC CALCULATOR WITH AN AUTOMATIC AMINO ACID ANALYZER,
Richard B. Russell Agricultural Research Center, Athens, Ga.
M. L. Fishman, L. M. Landgraff, and D. Burdick.
Journal of Chromatography, Vol 86, No 1, p 37-51, November 1973. 5 fig, 10 ref.

Descriptors: *Amino acids, *Chemical analysis, *Data processing, Interfaces, Electronic equipment, Costs, Instrumentation, Automatic control.
Identifiers: *Data interpretation, Automatic amino acid analyzer, Programmable electronic calculator, Chemical recovery, Kjeldahl nitrogen.

The rapid calculation of data from an automatic amino acid analyzer by a programmable electronic calculator is now possible. The programmable electronic calculator offers a less expensive and more flexible alternative to large computers. Typically, data in the form of retention times and peak areas are read from a punched tape and converted into final values with a minimum of data handling. A digital integator, teletypewriter with tape punch and reader, tape editor and printer also are required. A mathematical program is described that has been devised to convert raw data from a 4-h protein hydrolyzate run into final values. The final printout presents in tabular form each amino acid as a percentage of the sample dry weight and crude protein. The total weight percentage of amino acids and percentage recovery of protein based on Kjeldahl nitrogen are also calculated. Other features of the program include the ability to eliminate up to 20 extraneous peaks from the sample and to correct for sampling errors with the aid of internal standards. Amino acid molecular weights and color constants, which are also calculated, are stored without destruction so as to permit the calculation of an unlimited number of samples from the same set of standards. COULOMETRIC DETERMINATION OF IRON(II)-1,10-PHENANTHROLINE WITH CERIUM(IV),
Maryland Univ., College Park. Dept. of Chemistry.
S. W. McClean, and W. C. Purdy.
Analytica Chimica Acta, Vol 67, No 1, p 113-118, November 1973. 2 tab, 8 ref.

Descriptors: *Iron, *Electrochemistry, *Pollutant identification, Methodology, Chemical analysis, *Volumetric analysis, Heavy metals, Electrodes.
Identifiers: *Coulometric titration, Cerium, *Ferroin, Precision, Accuracy, Metal complexes, 1 10-Phenanthroline, Chemical concentration, End-point detection system.

Iron bound to 1,10-phenanthroline (ferroin) was determined by coulometric titration with electrogenerated cerium(IV). Titrations were performed in which generation was stopped from 1 min after about 80 percent of the sample had been titrated. No significant differences were observed between these titrations and those run with no delay. Those iron samples in the range 0.1-130 micrograms were titrated with a relative standard deviation of 0.7-5.0 percent and a relative error of

0-4.0 percent with the greatest inaccuracies and imprecision being at the lower end of the range, where titration times were shortest. The end-point detection system consisted of a platinum and a saturated calomel electrode across which a constant voltage is impressed. This voltage is such that the platinum electrode is 1.025 V vs N.H.E. The current between the indicating electrodes is monitored with a current-sensing device possessing a sensitivity of 0.0001 microA/mm. (Holoman-Battelle)

DETERMINATION OF EIGHT METALS IN THE INTERNATIONAL BIOLOGICAL STANDARD BY FLAMELESS ATOMIC-ABSORPTION SPECTROMETRY,
Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg bei Munich (West Germany).
P. Schramel.
Analytica Chimica Acta, Vol 67, No 1, p 69-77, November 1973. 10 fig, 3 tab, 6 ref.

Descriptors: *Trace elements, Calcium, Potassium, Sodium, Phosphorus, Aluminum, Cadmium, Copper, Chromium, Iron, Manganese, Lead, Sulfur, *Metals, Pollutant identification, *Spectrophotometry.
Identifiers: Flameless atomic absorption spectrophotometry, *Biological samples, Wet ashing, Human tissue, Vanadium, Tissue, Muscle, Plancenta, Sample preparation, Chemical interference.

Flameless atomic-absorption spectrometry was used to measure the concentration of trace elements (Al, Cd, Cr, Cu, Fe, Mn, Pb, and V) in biological material prepared by a wet-ashing procedure. The final wet-ashing procedure, applied in the present work, was as follows: cover 100-150 mg of dry sample with 100 microliters of concentrated sulphuric acid, and heat until fumes of sulphur trioxide appear. Then add dropwise 1.5-2 ml of 50 percent hydrogen peroxide until a clear solution is reached. Cool and dilute to 10 ml with twice-distilled water. Solutions prepared in this way were suitable for all the elements studied. All calibration curves were obtained with 10-microliter amounts of each 'pure' standard solution prepared in 0.18 M sulphuric acid. Subsequently, the effects of the matrix elements, calcium, potassium, sodium, and phosphorus were investigated. The interference of sulphur was taken into consideration by applying a 0.18 M sulphuric acid standard solution. The results showed that there were no interferences for the elements Al, Cd, Cu, Cr, Fe, and Mn; for all these metal ions, the calibration curves found were the same as with 'pure' standard solutions. There are very strong interferences with the absorbance signal in the case of lead. The 'pure' standard solutions of this element gave absorbance signals which were about three times higher than the signals in the case of the IBS matrix. Interferences were less significant in the case of vanadium. The results verified the usefulness and speed of the wet-ashing procedure for destroying biological materials and of the flameless atomic absorption procedure for analyzing particular trace elements in these materials. VOLTAMMETRIC BEHAVIOUR OF COPPER(III) AND ITS ANALYTICAL APPLICATIONS,
Siena Univ. (Italy). Istituto di Chimica Generale.
G. Raspi, P. Zanello, A. Cinquantini, and P. Corti.
Analytica Chimica Acta, Vol 66, No 3, p 435-442, October 1973. 2 fig, 3 tab, 19 ref.

Descriptors: *Copper, *Electrochemistry, *Chemical analysis, Aqueous solutions, Heavy metals, Methodology, Hydrogen ion concentration, Cations, Anions, Pollutant identification.
Identifiers: *Voltammetry, *Metal complexes, *Ligands, Reproducibility, Periodates, Tellurates, Amperometric titration, Ionic interference, Detection limits.

The voltammetric behavior of diperiodatocuprate(III) and ditelluratocuprate(III) complexes was investigated in aqueous solution at a platinum microelectrode for which the diffusion layer was periodically renewed. The voltammetric determination of Cu(II) was also investigated. The copper(II) and copper(III) complexes with periodate or tellurate ligands are electroactive at a smooth platinum electrode, giving an anodic, cathodic or cathanodic wave in the presence of alkaline hydroxide solutions containing copper(II), copper(III), or copper(II)-copper(III) species, respectively. The following analytical applications are proposed: (a) amperometric titration of copper(III) solutions; (b) voltammetric determination of copper. Results of amperometric titrations of copper(III) were similar to those by an established procedure. Voltammetry of copper(II) allows the metal to be determined down to concentrations of 0.00001 M, even in the presence of different ions; the procedure can be applied to such heat-transfer media for nuclear reactors as sodium and potassium metals and their hydroxides. CONFIRMATION OF HEXACHLOROBENZENE BY CHEMICAL REACTION,
Institut National de la Recherche Agronomique, Versailles (France).
B. E. Baker.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 5, p 279-284, November 1973. 4 fig, 4 ref.

Descriptors: *Chemical reactions, *Pollutant identification, *Methodology, Organic compounds, Separation techniques, Chlorinated hydrocarbon pesticides, Fungicides.
Identifiers: *Hexachlorobenzene, Chlorinated hydrocarbons, Lindane, Monoethoxypentachlorobenzene.

When hexachlorobenzene (HCB) is treated with sodium ethoxide, monoethoxypentachlorobenzene is formed. This chemical reaction can be used to identify and confirm the presence of HCB. That this same derivative can be used to identify HCB in the presence of isomers of lindane has been confirmed. A hexane solution of 1 microgram each of HCB and lindane was treated with sodium ethoxide and mixed with water. Sufficient HCl was added to give an acid reaction, the mixture extracted with hexane, dried over sodium sulfate, and analyzed by GC. After heating under reflux for 1 hr, product analysis showed the presence of unreacted HCB, MEPCB, and an unidentified peak X. (Holoman-Battelle)

OXYCHLORDANE RESIDUES IN HUMAN ADIPOSE TISSUE,
Environmental Protection Agency, Perrine, Fla. Primate and Pesticides Effects Lab.
F. J. Biros, and H. F. Enos.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 5, p 257-260, November 1973. 1 fig, 1 tab, 8 ref.

Descriptors: *Pesticide residues, *Gas chromatography, *Mass spectrometry, DDE, DDT, Separation techniques, Monitoring, *Pollutant identification.
Identifiers: *Adipose tissue, *Oxychlordane, Beta-HCH, Biological samples, Heptachlor epoxide, Sample preparation, Thin layer chromatography, Chlordane.

Twenty-seven specimens of adipose tissue collected from post-mortem examinations and therapeutic surgery were analyzed for a series of organochlorine residues by gas and thin-layer chromatography. Results were confirmed using mass and infrared spectral analyses. Two column were employed for gas chromatography: 1.5 percent OV-17/1.95 percent QF-1, RRT subaldrin of oxychlordane, 1.38 at 200 C and 5 percent OV-210 RRT subaldrin of oxychlordane, 1.56 at 180 C. The tissue was extracted with petroleum ether. Results showed the presence of beta-HCH, oxychlordane, p,p'-DDE, o,p'-DDT, p,p'-DDT, and heptachlor epoxide. The occurrence of storage of oxychlordane residues in general population human adipose tissue may indicate consistent previous exposure to chlordane insecticide and/or oxychlordane from many possible sources. THE CHARACEAE OF SOUTHEASTERN UNITED STATES,
Rhode Island Univ., Kingston. Dept. of Botany.
M. C. Choudhary, and R. D. Wood.
The American Midland Naturalist, Vol 90, No 2, p 413-446, October 1973. 1 tab, 93 ref.

Descriptors: *Chara, *Chlorophyta, *Southeast U.S., *Speciation, Varieties, *Systematics, Aquatic algae, Marine algae.
Identifiers: *Nitella, Chara vulgaris, Chara canescens, Chara globularis, Chara zeylanica, Chara braunii, Chara fibrosa, Chara hornemannii, Nitella flexilis, Nitella acuminata, Nitella clavata, Nitella cernaua, Nitella capillata, Nitella furcata, Nitella tenuissima, Nitella gracilis, Nitella hyalina, Nitella translucens, Chara globularis var. virgata, Chara globularis var. leptosperma, Nitella clavata var. dilatata, Nitella gracilis var. leptosoma, Nitella gracilis var. asagrayana, Nitella gracilis var. capitellata.

A study was made of characeae of the 10 southeastern states based upon preserved and herbarium specimens. The findings are compiled in a floristic report containing a key to species, notes on each species and variety - a brief synonymy, list of published records, sources of illustrations and exsiccatae and remarks on the taxa. The Characeae of the Southeast comprise two genera, Chara and Nitella, and 17 species which represent a large proportion of the three genera and 22 species treated for North America. The frequency of occurrence of Characeae was 5 percent, far lower than the 19 percent in Fiji and 28 percent in Australia. A new taxon, N. flexilis var. americana, from Florida, resembles N. flexilis but has distinct mueus. Taxa newly reported for the region are C. globularis var. virgata, var. leptosperma, N. clavata var. dilatata, and N. gracilis var. leptosoma and var. asagrayana. Particular attention is paid to the infraspecific variation of C. zeylanica, and a number of varieties and forms previously recorded from other areas were found to be represented in the Southeast. Mohr's (1884) unusual collections from Mobile were re-examined, and for the most part the original identifications were confirmed. (Holoman-Battelle)

SCANNING ELECTRON MICROSCOPY OF BACTERIAL COLONIES,
Agricultural Research Service, Peoria, Ill. Northern Regional Research Lab.
E. G. Afrikian, G. St. Julian, and L. A. Bulla, Jr.

Applied Microbiology, Vol 26, No 6, p 934-937, December 1973. 3 fig, 14 ref.

Descriptors: *Pollutant identification, *Cytological studies, Methodology, Electron microscopy, Cultures, Bacteria.
Identifiers: *Scanning electron microscopy, *Bacterial colonies, Reproducibility, Sample preparation, Culturing techniques, Bacillus cereus, Bacillus subtilis, Bacillus cereus var. mycoides, Culture media.

A technique is described for observing bacterial colony growth. Bacillus cereus, B. subtilis, and B. cereus var. mycoides were grown on strips of dialysis membrane layered on nutrient agar. Microcolonies of the organisms on strips were fixed in Formalin vapor in situ; the strips then were removed from the agar and secured to scanning microscope specimen stubs without markedly disturbing the cellular arrangement. Scanning electron micrographs clearly depict morphology of individual cells, as well as the spatial orientation of cells within the colony. This technique is reproducible, adaptable, and simple. RECOVERY AND IDENTIFICATION OF ANAEROBES: A SYSTEM SUITABLE FOR THE ROUTINE CLINICAL LABORATORY,
Columbia-Presbyterian Medical Center, New York. Diagnostic Microbiology Service.
P. D. Ellner, P. A. Granato, and C. B. May.
Applied Microbiology, Vol 26, No 6, p 904-913, December 1973. 4 fig, 8 tab, 16 ref.

Descriptors: *Anaerobic bacteria, *Pathogenic bacteria, *Pollutant identification, *Isolation, Methodology, Laboratory tests, Antibiotics(Pesticides).
Identifiers: Culture media, *Culturing techniques, *Recovery, Selective media, Gas liquid chromatography, Gram-negative bacteria, Gram-positive bacteria, Clostridium cadaveris, Clostridium histolyticum, Clostridium lentoputrescens, Clostridium subterminale, Clostridium tetani, Clostridium cochlearium, Body fluids, Blood, Biochemical tests, Bacteroides serpens, Bacteroides spp, Drug resistance, Fusobacterium nucleatum, Fusobacterium spp, Eubacterium spp, Arachnia propionica, Peptococcus magnus.

A system is described in which clinical specimens to be cultured for anaerobes are plated on reducible media and incubated in Gas Pak jars for 24 h. Clinical specimens were carfully selected for culture using this system. Generally those specimens originating from body sites harboring normal commensal flora were not cultured. Several experimental formulations of the prereduced anaerobically sterilized (PRAS) transport media were compared with Amies transport medium without charcoal. Using Clostridium novyi B, no significant advantage was observed with the experimental media over Amies medium. Selective and nonselective formulations of reducible media were used for primary isolation. The isolates were identified according to the Gram stain of the pure chopped meat glucose (CMG) culture in combination with gas-liquid chromatography. Pure, undiluted 24-h CMG culture was used to inoculate anaerobic blood agar (anBAP) for antibiotic susceptibility testing. Antibiotic disks of penicillin, ampicillin, carbenicillin, chloramphenicol, tetracycline, erythromycin and clindamycin were used. The methods have been tested in a high-volume routine microbiology laboratory (more than 700 specimens per day), but are also suitable for smaller laboratories. The system permits improved recovery and identification of the majority of anaerobes within a time period commensurate with clinical practice. Preliminary reports with presumptive identification are often available within 48 h, and the final report with complete identification and antibiogram is usually available within 4 days. (Holoman-Battelle)

METHOD FOR RADIORESPIROMETRIC DETECTION OF BACTERIA IN PURE CULTURE AND IN BLOOD,
Biospherics, Inc., Rockville, Md.
J. R. Schrot, W. C. Hess, and G. V. Levin.
Applied Microbiology, Vol 26, No 6, p 867-873, December 1973. 6 fig, 2 tab, 21 ref.

Descriptors: Methodology, *Bacteria, *Pollutant identification, *Radioactivity techniques, Testing procedures, Laboratory tests, Laboratory equipment, Carbon radioisotopes, Instrumentation, Time, E. coli, *Cultures, Streptococcus, Detergents.
Identifiers: Pure cultures, *Blood, *Radiorespirometry, Trace levels, Carbon dioxide evolution, Culture media, Body fluids, Biological samples, Pseudomonas aeruginosa, Klebsiolla, Staphylococcus aureus, Salmonella paratyphi B, Salmonella typhi, Salmonella dysenterae, Haemophilus aphrophilua,Enterobacter aerogenes, Serratia marcescens, Proteus vulgaris, Cardiobacterium, Rhozyme, Triton X-100.

Methods are described for the detection of low numbers of bacteria by monitoring C-1402 evolved from C-14-labeled substrates. Cell suspensions are filtered with membrane filters, and the filter is then moistened with 0.1 ml of labeled medium in a small, closed apparatus. Evolved C-1402 is collected with Ba(OH)2-moistened filter pads and assayed with conventional radioactivity counting equipment. The kinetics of C-1402 evolution are shown for several species of bacteria. Fewer than 100 colony-forming units of most species tested were detected in 2 h or less. Bacteria were inoculated into blood and the mixture was treated to lyse the blood cells. The suspension was filtered and the filter was placed in a small volume of labeled medium. The evolved C-1402 was trapped and counted. A key development in the methodology was finding that an aqueous solution of Rhozyme and Triton X-100 produced lysis of blood but was not detrimental to bacteria. (Holoman-Battelle)

UREASE ACTIVITY OF ENTEROBACTERIACEAE: WHICH MEDIUM TO CHOOSE,
Ghent Rijksuniversiteit (Belgium). Lab. for Pharmaceutical Microbiology.
A. Vuye, and J. Pijck.
Applied Microbiology, Vol 26, No 6, p 850-854, December 1973. 1 fig, 4 tab, 11 ref.

Descriptors: *Pollutant identification, *Enteric bacteria, Coliforms, Shigella, Salmonella, Aerobic bacteria, Pathogenic bacteria.
Identifiers: *Culture media, *Urease, *Biosynthesis, *Selective media, Biochemical characteristics, Enzyme activity, Solid media, Liquid media, Biological samples, Proteus spp, Yersinia, Escherichia, Edwardsiella, Arizona, Citrobacter, Klebsiella pneumoniae, Klebsiella ozoenae, Klebsiella rhinoscleromatis, Enterobacter cloacae, Enterobacter aerogenes, Enterobacter hafniae, Enterobacter liquefaciens, Pectobacterium, Serratia, Providencia, Elek medium, Christensen urea agar, Fecal coliforms, Stuart media, Proteus mirabilis.

Detection and intensity of urease activity in enterobacteriaceae greatly varies as a function of the media or techniques used, or both. A comparative investigation on several solid and liquid media led to the following conclusions. (1) Detection of Proteus spp. can be adequately performed with the highly selective solid medium described by Cook (1948), as well as with the different liquid media described (Stuart standard and rapid media; Elek medium). (2) Detection of Klebsiella should be based upon urease production on solid media with low buffer capacity (Christensen, 1964). (3) For the identification of Yersinia, either the solid Christensen urea agar or the rapid Elek technique gives optimal results. (Holoman-Battelle)

ESTIMATING THE DENSITY OF INDIVIDUAL BACTERIAL POPULATIONS INTRODUCED INTO NATURAL ECOSYSTEMS,
Cornell Univ., Ithaca, N.Y. Lab. of Soil Microbiology.
S. K. A. Danso, M. Habte, and M. Alexander.
Canadian Journal of Microbiology, Vol 19, No 11, p 1450-1451, November 1973. 2 fig, 1 ref.

Descriptors: *Bacteria, *Soils, *Cultures, Ecosystems, Growth rates, Inhibitors, Antibiotics(Pesticides), Pollutant identification, Methodology, Cultures, Measurement.
Identifiers: Xanthomonas campestris, Erwinia carotovora, Rhizobium trifolii, Rhizobium meliloti, Mutants, Streptomycin, Neomycin, Polymyxin, Penicillin, Tetracycline, Chloramphenicol, Crystal violet, Congo red, Culture media.

The abundance of individual strains of Xanthomonas, Erwinia, and Rhizobium added to soil was determined by a method that allows for the enumeration of surviving cells on the introduced population in the presence of many other soil microorganisms. The method should be useful for measuring numbers of other bacteria in heterogeneous communities. The method involves using mutants of the species of interest which are resistant to antibacterial agents that prevent the growth of nearly all other populations in the environment. The bacteria used were Xanthomonas campestris, Erwinia carotovora, Rhizobium trifolii, and Rhizobium meliloti. Streptomycin was selected as the chemical of choice since Rhizobium mutants could be obtained easily by growing the cultures in yeast extract - mannitol broth containing about 50 micrograms streptomycin sulfate/ml and transferring the survivors to the same medium containing higher antibiotic concentrations. By these means, isolates resistant to 1000 micrograms streptomycin sulfate/ml were obtained. Spontaneous mutants of X. campestris and E. carotovora were obtained by inoculating large numbers of the cells into trypticase soy broth containing 800 micrograms streptomycin sulfate/ml, incubating the broth until growth was observed, plating the suspension on a solid medium of the same composition. It should not be too difficult to obtain mutants of other species which grow in media containing antibacterial compounds in concentrations sufficiently high to prevent the replication of large percentages of the residents of natural ecosystems. (Mortland-Battelle)

THE EFFECT OF THYROXINE AND TRIIODOTHYRONINE ON BACTERIAL GROWTH,
Bar-Ilan Univ., Ramat Gan (Israel). Dept. of Life Sciences.
N. Garber, and B. Lupowitz-Donenfeld.
Canadian Journal of Microbiology, Vol 19, No 11, p 1401-1405, November 1973. 7 fig, 21 ref.

Descriptors: E. coli, *Growth rates, *Bacteria, Pseudomonas, Salmonella, Streptococcus, Bioindicators, Cultures, Iron, Calcium, Chelation, Turbidity, Inhibitors, Separation techniques, Isolation.
Identifiers: *Thyroxine, *Triiodothyronine, EDTA, Hormones, Bacillus cereus, Bacillus licheniformis, Streptococcus faecalis, Staphylococcus albus, Serratia marcescens, Shigella boydii, Pseudomonas aeruginosa, Salmonella typhi, Aerobacter aerogenes, Potassium iodide, Differential media, Gram-negative bacteria, Gram-positive bacteria, Bacterial physiology.

The effects of L-thyroxine, D-thyroxine, and 3,5,3'-triiodothyronine on the growth of several Gram-positive and Gram-negative bacteria were examined. The first two compounds, at a concentration of 0.000077 M, were found to have a considerable inhibitory effect while 3,5,3'-triiodothyronine had a very weak effect on the growth of the Gram-positive bacteria examined.

The growth of the Gram-negative bacteria was not inhibited under the same conditions. Potassium iodide, at the same concentration, was not inhibitory. Release of free iodine from the thyroxine preparation was also excluded as contributing to the thyroxine effect because it was shown to be less toxic than thyroxine for Bacillus cereus 569 and to exhibit a similar inhibitory effect on Gram-positive and Gram-negative bacteria. The inhibition of Gram-positive bacteria by L-thyroxine was reduced by cations such as Mn(2 plus), Fe(2 plus), and Ca(2 plus). However, the hormones were more potent in their effect compared to EDTA in the same molar concentration and the inhibition exerted by them was not so easily abolished by the divalent cations as it was in the case of EDTA. Although chelation could contribute to the inhibition of the bacteria by the iodinated hormones, it seems that it is not the only factor involved. (Mortland-Battelle)
W74-04891

METHOD FOR ROUTINE CULTURING OF STRICT ANAEROBIC BACTERIA,
Pretoria Univ. (South Africa). Dept. of Microbiology.
L. van Wyk.
Laboratory Practice, Vol 22, No 11, p 681, November 1973. 6 ref.

Descriptors: *Anaerobic bacteria, *Cultures, Incubation.
Identifiers: Agars, Reazurin, Inoculation, Slant cultures, Sample preservation, Culture media, Sample preparation, Culturing techniques.

Routine culturing of marine anaerobes is accomplished by adding 4 ml anaerobic medium to McCartney bottles previously gassed with a CO2, N2, and H2 mixture. The tightly stoppered bottles are sterilized at 121C for 15 minutes and cooled in a slanted position. The bottles are then filled with a sterile semisolid agar containing 0.15 g washed agar, 0.0001 g reazurin, 2.5 ml reducing solution, and 100 ml distilled water. This agar together with rubber-lined metal caps, protects the slant culture from air, and the indicator shows if the medium becomes too oxidized to permit growth of the anaerobes. Inoculation of the slants can be carried out with a platinum loop in a stream of sterile CO2 without air ever coming into direct contact with the grown medium. By this method cultures of anaerobic bacteria from sheep rumen were effortlessly maintained. After initial incubation at 38C for 48 hr, cultures were stored at 4C for 60 d, whereupon transfers were successfully made to fresh anaerobic slants. Slides for gram stains were easily prepared from these slant cultures. Since the preparation of media is time consuming, a large number of McCartney bottles may be simultaneously prepared as described and stored at 4C until required without marked changes in the medium taking place. LIPOPOLYSACCHARIDE FROM A GRAM-NEGATIVE MARINE BACTERIUM,
Providence Coll., R.I. Dept. of Biology.
A. Mongillo, K. Deloge, D. Pereira, and G. P. O'Leary.
Journal of Bacteriology, Vol 117, No 1, p 327-328, January 1974. 1 tab, 18 ref.

Descriptors: *Marine bacteria, *Lipids, Sands, Sea water, Cultures, Nutrients, Sodium chloride, Centrifugation, Chromatography, *Rhode Island.
Identifiers: *Lipopolysaccharides, Lipid A, Pseudomonads, *Narragansett Bay(R.I.), Paper chromatography.

To investigate the occurrence of marine lipopolysaccharides, a number of marine microorganisms were isolated from sand and seawater collected from Narragansett Bay, Rhode Island. Upon initial screening, one organism was chosen for analysis. Cultural and biochemical characteristics indicated that the organism was a nonmotile pseudomonad. The organism was routinely cultivated at room temperature with constant shaking in a medium containing 5.0 g of nutrient broth, 8.0 g of yeast extract, and the complete salts solution per liter of distilled water. The organism was grown for 24 hr, harvested by centrifugation, washed in complete salt solution, and extracted by the phenol-salts method. The material isolated from this marine pseudomonad as lipid A showed many of the characteristics of other lipid A molecules: it contained glucosamine, and phosphate; its solubility in lipid solvents such as chloroform indicated the presence of fatty acids; and the two hexoses present, glucose and galactose, are also commonly found in the polysaccharide portion of the LPS molecule. Absent from the preparation was the heptose monosaccharide. The absence of the core could indicate that this pseudomonad may only produce an incomplete LPS. Another possibility is that the proper concentration of cations were not present during the extraction to hold the core portion intact. The organism does, however, possess a type of lipopolysaccharide molecule. (Mortland-Battelle)

THE ESTIMATION OF RELATIVE POTENCY FROM TWO PARABOLAS IN SYMMETRIC BIOASSAYS,
Edinburgh Univ. (Scotland). Dept. of Statistics.
D. A. Williams.
Biometrics, Vol 29, No 4, p 695-700, December 1973. 2 tab, 3 ref.

Descriptors: *Estimating, *Statistical methods, Equations, *Bioassay, Lethal limit, Mathematical studies.
Identifiers: Symmetric bioassay, *Relative potency, Mean square error, Parabolas.

Three estimators of relative potency from two parabolas in symmetric bioassays, the estimator proposed by Elston (1965), the maximum likelihood (ML) estimator, and the usual estimator assuming linearity, are compared. The results of a simulation study indicate that in well designed assays Elston's estimator performs at least as well as the other two estimators, whether or not the log-dose response regression is linear. W74-04899

AN APPRAISAL OF IDENTIFICATION METHODS FOR PENICILLIUM SPECIES: NOVEL TAXONOMIC CRITERIA BASED ON TEMPERATURE AND WATER RELATIONS,
Commonwealth Scientific and Industrial Research Organization, North Ryde (Australia). Div. of Food Research.
J. I. Pitt.
Mycologia, Vol 65, No 5, p 1135-1157, September/October 1973. 1 fig, 6 tab, 22 ref.

Descriptors: *Cultures, *Speciation, *Fungi, Systematics, Temperature, Pollutant identification, Methodology.
Identifiers: *Culture media, *Water activity, *Penicillium, Eupenicillium, Paecilomyces, Talaromyces.

Examination of media and methods currently used in Penicillium taxonomy led to the conclusion that by using only two media, Czapek yeast autolysate agar and malt extract agar, and by incubating cultures at 25C for 7 days, one could obtain classical taxonomic data with optimal efficiency. The effect of reduced water activity and reduced and elevated temperatures on the growth of Penicillium spp. accepted in the Raper and Thom A Manual of the Penicillia was studied. On a glycerol-nitrate salts agar of 0.93 water activity, and on Czapek yeast autolysate agar at 5C and 37C, extent of growth after 7 days provided taxonomically valuable data; within-species variation was low, while between-species variation was sufficiently marked to assist in determinative classification. Moreover, water relations, as assessed by the above technique, showed a very high correlation with penicillus type in some Sections of the genus. (Little-Battelle)

IMPROVED PH CONTROL OF FUNGAL CULTURE MEDIA,
National Research Council of Canada, Saskatoon, (Saskatchewan). Prairie Regional Lab.
J. J. Child, C. Knapp, and D. E. Eveleigh.
Mycologia, Vol 65, No 5, p 1078-1086, September/October 1973. 1 fig, 4 tab, 14 ref.

Descriptors: *Fungi, *Hydrogen ion concentration, *Growth rates, Phosphates.
Identifiers: *Culture media, Aspergillus midulans, Penicillium patulum, Claviceps, Sporulation, Allomyces arbusculus, Aspergillus fonsecaeus, Chaetomium funicola, Coprinus comatus, Geotrichum candidum, Neurospora crassa, Penicillium chrysogenum, Pythium acanthicum, Rhizopus sexualis, Saccharomyces cerevisiae, Sordaria funicola, Ustilago maydis, Zygorhynchus.

A number of fungi grew well in the presence of relatively high concentrations (40 millimoles) of phosphate and MES (2-(N-morpholino) ethane sulfonic acid) buffers at either pH 5.5 or 7.0. In certain instances better growth and sporulation were observed than that found using more conventional growth media (malt, Czapek-Dox) that lack any marked buffering capacity. EMTA (3,6-endomethylene-1,2,3,6-tetrahydro-cisphthalic acid) could be used as a buffer for fungal culture media with certain species only. As good growth and no major change in chemical composition occurred, these buffers are recommended for use in high concentration to eliminate pH variation in comparative physiological studies. Fungal strains used were: Allomyces arbusculus, Aspergillus fonsecaeus, Chaetomium funicola, Claviceps sp., Coprinus comatus, Geotrichum candidum, Pythium acanthicum, Rhizopus sexualis, Saccharomyces cerevisiae, Sordaria funicola, Ustilago maydis, and Zygorhynchus sp. (Little-Battelle)
W74-04903

COMPOSITION AND WASTE LOAD OF UNIT EFFLUENTS FROM A COMMERCIAL LEAFY GREENS CANNING OPERATION,
Georgia Univ., Experiment. Div. of Food Science.
W. A. Bough.
Journal of Milk and Food Technology, Vol 36, No 11, p 547-553, November 1973. 1 fig, 7 tab, 14 ref.

Descriptors: *Effluents, *Canneries, *Waste identification, Acidity, Chemical oxygen demand, Biochemical oxygen demand, Suspended solids, Dissolved solids, Hydrogen ion concentration, Waste disposal, *Pollutant identification.
Identifiers: *Vegetables, Characterization, Settleable solids, Effluent standards.

Analysis of data on composite waste loads from canning of collard, turnip, mustard, spinach, and kale greens revealed no significant differences among the five types of greens. For unit effluents from the dunker washers, reel washers, and blancher, significant differences were found for solids load and total acidity. The most concentrated effluent was from the tumbler fillers. The average composite waste load for all leafy greens was 20.2 plus or minus 5.7 lb/ton COD, 8.5 plus or minus 2.8 lb/ton BOD, 2.8 plus or minus 1.2 lb/ton suspended solids, and 2,666 plus or minus 427 gal/ton waste water. These values are less than one-half of those previously reported for wastes from spinach greens. These results suggest possibly improvement for inplant control of waste from leafy greens, and may also be relevant to the setting of effluent standards for the fruit and vegetable industry. (Mortland-Battelle)

MULTIPURPOSE MEDIUM FOR USE WITH PSEUDOMONAS SPECIES,
Boston City Hospital, Mass. Channing Lab.
S. L. Rosenthal.
Applied Microbiology, Vol 26, No 6, p 1013-1014, December 1973. 1 tab, 3 ref.

Descriptors: *Pseudomonas, *Pollutant identification, *Testing procedures, Denitrification, Hydrolysis, Cultures, Aerobic bacteria, Methodology.
Identifiers: *Culture media, *Biochemical characteristics, Chemical composition, Substrate utilization, Gelatinase, Starch, Acinetobacter, Pseudomonas aeruginosa, Pseudomonas maltophilia, Pseudomonas cepacia, Pseudomonas putida, Pseudomonas pseudoalcaligenes, Pseudomonas alcaligenes, Pseudomonas marginata, Pseudomonas stutzeri, Pseudomonas acidovorans, Pseudomonas diminuta, Pseudomonas fluorescens, Pseudomonas mendocina, Pseudomonas testosteroni.

A medium consisting of the following can be used to detect starch hydrolysis, gelatinase production, and denitrification by pseudomonads: yeast extract (Difco) 5 g; KNO3, 5 g; K2HPO4, 1 g; gelatin, 4 g; soluble starch, 2 g; agar (Difco), 15 g; water, 1,000 ml. Fifty-eight Pseudomonas strains were grown on the medium. The identity of P. aeruginosa was confirmed by the presence of the characteristic odor and pigments and by the possession of acetamide deaminase. The requirement for methionine as a growth factor served as a confirmatory test for P. maltophilia. The remaining species were identified by a battery of 14 single carbon source assimilation tests. All strains grew rapidly and well on the medium. Forty-nine Acinetobacter strains were also tried. All grew well aerobically and had either positive or negative tests for gelatinase. None grew anaerobically. (Holoman-Battelle)
W74-04906

ISOLATION AND CHARACTERIZATION OF A THERMOTOLERANT METHANOL-UTILIZING YEAST,
Massachusetts Inst. of Tech., Cambridge. Dept. of Nutrition and Food Science.
D. W. Levine, and C. L. Cooney.
Applied Microbiology, Vol 26, No 6, p 982-990, December 1973. 5 fig, 3 tab, 17 ref.

Descriptors: *Isolation, *Pollutant identification, *Cytological studies, *Biological properties, Yeasts, Soil fungi, Growth rates, Toxicity, Heat resistance, Organic compounds, Soil microorganisms, Temperature, Proteins, Amino acids, Methodology, Chemical analysis.
Identifiers: *Methanol, Characterization, *Hansenula polymorpha, Ascomycetes, Substrate utilization, Growth media, Chemical composition, Continuous cultures, Culture media, Nucleic acids, Rats.

A yeast capable of growth on methanol as its sole carbon-energy source was isolated from soil samples and identified as a strain of Hansenula polymorpha. A continuous enrichment culture at 37C with a simple mineral salts medium was used to select this organism. The isolate, designated DL-1, has a maximal specific growth rate of 0.22 per h, at pH 4.5 to 5.5 and temperatures of 37 to 42C, in simple mineral salts medium with methanol (0.5 percent), biotin, and thiamine. Growth occurred in a chemostat at temperatures up to 50C, with strong growth at 45C. The maximal growth yield of the yeast on methanol was 0.36 g of dry cell weight per g of methanol, and the yield on oxygen was 0.37 g of dry cell weight per g of O2. Protein content of the isolate is 46 percent, and total nucleic acid content varies from 5.0 to 7.0 percent with increasing growth rate from 0.08 to 0.20 per h. The amino acid profile of this yeast protein indicated that it could serve as a good source of food protein. Feeding studies with rats show the yeast to have no toxic effects. (Holoman-Battelle)
W74-04907

IDENTIFICATION OF BACTERIA BY COMPUTER: GENERAL ASPECTS AND PERSPECTIVES,
Central Public Health Lab., London (England).
National Collection of Type Cultures.
S. P. Lapage, S. Bascomb, W. R. Willcox, and M. A. Curtis.
Journal of General Microbiology, Vol 77, No 2, p 273-290, August 1973. 1 fig, 7 tab, 26 ref.

Descriptors: *Aerobic bacteria, *Numerical analysis, *Computer programs, *Enteric bacteria, Probability, Statistical methods, Laboratory tests, E. coli, Pathogenic bacteria, Coliforms, Shigella, Pseudomonas, Pollutant identification.
Identifiers: Salmonella typhi, Moraxella, Citrobacter, Chromobacterium violaceum, Pasteurella, Gram-negative bacteria.

A probability method for identification of bacteria is discussed. Gram-negative, rod-shaped bacteria were chosen as a model and a table (matrix) was constructed which contained the estimated probabilities of a positive result in each test for each taxon. The results of tests on an unknown strain were compared with the stored probabilities and the likelihood that the strain belonged to each of the matrix taxa was calculated in turn by multiplication of the relevant probabilities. These likelihoods were normalized and the value for each taxon referred to as the identification score for that taxon. This procedure was applied to reference strains and to freshly isolated strains (field strains) from various medical diagnostic bacteriological laboratories. The resulting data were used to improve the matrix, investigate the number of tests needed for identification, estimate test differences between laboratories and for test selection strategies. The matrix was stored in a computer in which all calculations were carried out. Identification rates for fermentative bacteria of 90.8 percent for reference strains and 89.4 percent for field strains were obtained, and for nonfermentative bacteria of 82.1 percent and 70.8 percent respectively. The field strains were received because they were difficult to identify in the medical diagnostic laboratory; higher rates of identification might be expected for typical strains. (See also W74-04910) (Mortland-Battelle)
W74-04909

IDENTIFICATION OF BACTERIA BY COMPUTER: IDENTIFICATION OF REFERENCE STRAINS,
Central Public Health Lab., London (England).
National Collection of Type Cultures.
S. Bascomb, S. P. Lapage, M. A. Curtis, and W. R. Willcox.
Journal of General Microbiology, Vol 77, No 2, p 291-315, August 1973. 5 tab, 178 ref.

Descriptors: *Pollutant identification, *Numerical analysis, *Computer programs, *Enteric bacteria, E. coli, Salmonella, Shigella, Analytical techniques, Laboratory tests, Aerobic bacteria, Pathogenic bacteria, Proteins.
Identifiers: Klebsiella, Gram-negative bacteria.

The results of the identification of 1079 reference strains of Gram-negative, aerobic, rod-shaped bacteria by the probabilistic method in a computer are given. Comparison of identification by conventional methods and by computer showed that 90.8 percent of fermentative and 82.1 percent of nonfermentative strains could be identified on the best available probability matrix. Many of these strains were typical and had caused difficulty in identification in the medical diagnostic laboratory. The implications of various factors in successful computer identification are discussed and the results are given for each taxon by genus and species. (See also W74-04909) (Mortland-Battelle)
W74-04910

REPORT ON THE COMPOSITION OF OIL FROM THE REGION OF NEW HYDROCARBON UPWELLING IN THE SANTA BARBARA CHANNEL,
California Univ., Santa Barbara. Marine Science Inst.
P. G. Mikolaj.
Available from NTIS, Springfield, Va. 22151 Com73-11613; Price $2.75 printed copy; $1.45 microfiche. Report, August 1973. 9 p, 8 fig, 2 tab, 9 ref.

Descriptors: *Oil spills, *California, *Gas chromatography, *Trace elements, Provenance, *Pollutant identification, Chemical analysis, Oil fields.
Identifiers: *Santa Barbara Channel(Calif).

Oil from the area of new hydrocarbon upwelling in the Santa Barbara Channel was analyzed by gas chromatography and characterized by trace elements. The chemical composition of oil from the new area of hydrocarbon upwelling is significantly different from oil originating at the nearshore natural seeps in the vicinity of Coal Oil Point. Compared to oil from the Coal Oil Point region, the new seep oil contains approximately one-half the concentration of nickel and vanadium. Oil from Coal Oil Point is highly naphthenic, while oil from the new seep contains significant amounts of normal paraffins out to carbon number 30 and beyond. Oil from the new seepage area is generally similar to oils produced from the Sisquoc and Monterey formations of the Santa Barbara Channel. The site of the new hydrocarbon upwelling is located in the middle of an area where, during the period 1946 to 1947, previous oil and gas seeps of natural origin were reported. (Knapp-USGS)

A STUDY OF THE RELIABILITY OF CONTINUOUS WATER QUALITY MONITORING,
Tennessee Univ., Knoxville. Water Resources Research Center.
P. E. Davis.
Available from the National Technical Information Service as PB-228 872, $6.00 in paper copy, $1.45 in microfiche. Research Report No. 36, 1973. 51 p, 7 fig, 4 tab, 5 ref, append. OWRR A-022-TENN(1).

Descriptors: *Water quality, *Monitoring, *Tennessee, *Reservoirs, *Forecasting, Water temperature, Dissolved oxygen, Hydrogen ion concentration, Conductivity, Hydrologic data, Streamflow.
Identifiers: *Fort Loudoun Reservoir(Tenn).

An investigation was made of the reliability of continuous water quality monitoring on Fort Loudoun Reservoir. Two continuous monitoring systems were used, and the parameters of temperature, dissolved oxygen, pH, and conductivity were considered. Manual cross sectioning was used to determine the various values in the stream. At both stations, the data taken from the monitor was found to provide an accurate prediction of the conditions of the stream. A comparison of samples taken at the pumps and at the monitors showed that no appreciable change in any of the parameters was induced by the intake systems.

FALLOUT PROGRAM QUARTERLY SUMMARY REPORT, (HEALTH AND SAFETY LABORATORY, AEC, NEW YORK),
Health and Safety Lab. (AEC), New York.
E. P. Hardy, Jr.
Available from NTIS, Springfield, Va., as Rept. HASL-276. $7.60 per copy, $1.45 microfiche. Report HASL-276, Oct. 1973. 176 p, 8 fig, 38 tab, 90 ref, 5 append.

Descriptors: *Radioactivity, *Fallout, *Monitoring, Measurement, *Strontium, Radioisotopes, Sampling, Milk, Water, Food chains, Public health, Forests, Forest soils, Vegetation, Ranges, Diets, Toxicity, Data collections.
Identifiers: *Iridium, *Plutonium, New York City, San Francisco.

Current data are presented from the HASL Fallout Program; The National Center for Atmospheric Research in Boulder, Colorado; The National Radiation Laboratory in New Zealand; and the EURATOM Joint Nuclear Research Centre at Ispra, Italy. Interpretive reports and notes are included on the global deposition of Sr-90 through 1972, sulfate concentrations in the lower stratosphere, global fallout in a forest compared with an open field, and detection of Ir-192 from recent nuclear tests in the southern hemisphere. Extensive tabulations of radionuclide levels in fallout, surface air, stratospheric air, milk, diet, and tap water are included. A bibliography of recent publications related to radionuclide studies is also presented. (See also W74-05175) (Houser-ORNL)
W74-05174

FALLOUT PROGRAM QUARTERLY SUMMARY REPORT - JUNE 1, 1973, THROUGH SEPTEMBER 1, 1973, APPENDIX,
Health and Safety Lab. (AEC), New York.
E. P. Hardy, Jr.
Available from NTIS, Springfield, Va., as Rept. No. HASL-276, Append. $10.60 per copy, $1.45 microfiche. Report No. HASL-276-Appendix, Oct. 1, 1973. 459 p, 5 append.

Descriptors: *Radioactivity, *Fallout, *Monitoring, Measurement, *Strontium, Radioisotopes, Sampling, Milk, Water, Food chains, Public health, Forests, Soils, Ranges, Diets, Toxicity, Data collections, Data processing, Data storage and retrieval, Data transmissions.
Identifiers: *Iridium, *Plutonium.

There are 35 monthly monitoring sites in the United States and 90 in other countries. A map showing the sites is presented. To facilitate the accurate storage, retrieval and handling of the data generated from the monthly fallout collection network, all data have been transcribed to punched cards. To accomplish this transcription several rigid criteria were applied to the data. One condition was that only monthly data were punched onto the cards. The data printed out from the punched cards are presented in tables. Data are given on the following: (A) Sr-90 and Sr-89 in Monthly Deposition at World Land Sites; (B) Radionuclides and Lead in Surface Air; (C) Radiostrontium in Milk and Tap Water; (D) Table of Conversion Factors; (E) Table of Radionuclides. LOW-LEVEL RADIOACTIVITY MEASUREMENTS,
National Bureau of Standards, Washington, D.C.
J. M. R. Hutchinson, W. B. Mann, and R. W. Perkins.
Nuclear Instruments and Methods, Vol. 112, p 305-318, 1973. 16 fig, 7 tab, 20 ref.

Descriptors: *Radioactivity, *Measurements, *Assay, *Water pollution, *Measuring instruments, Equipment, Research and development, Monitoring, Radioactive waste, Biological control, Ion transport, Nuclear explosions, Nuclear powerplants, Effluents, Radioisotopes, Public health, Meteorology.

Low-level radioactivity measurements are reviewed. Alpha- and beta-particle, and Gamma-ray low-level-radioactivity counting is discussed, and various detector systems are compared for detection sensitivity. Low-level measurements on bovine liver standard reference material, and radioactive contamination in industrial samples of aluminum, copper, and steel are reviewed. The results of low-level radioactivity intercomparisons are discussed. Intercomparison studies are made from separate sea-water samples and spiked samples from Lake Michigan. (Houser-ORNL)

A PROPOSED MECHANISM FOR THE RECYCLING OF RADIOCESIUM IN FLORIDA SOIL PLANT SYSTEMS,
Florida Univ., Gainesville. Dept. of Botany.
J. F. Gamble.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 133-139, (1971) 1 fig, 3 tab, 26 ref.

Descriptors: *Cesium, *Recycling, Ecology, *Radioecology, Absorption, Milk, Fallout, *Ecosystems, *Florida, Cycles, Cycling nutrients, Food chains, Soils, Fertility, Nutrients, Forests, Radioactive tracers, Tracking techniques, *Path of pollutants.

Cesium-137 levels in Florida milk samples are five to six times higher than the United States average. There is no evidence to suggest that Florida has received unusually high amounts of fallout. The elevated levels are attributed to ecological concentration factors. Preliminary data of ecosystem compartments, part of a larger, detailed program, indicate that the mechanism responsible for the high, continued Cs-137 activity in the Florida biosphere is a combination of cycling within the plant vascular system and a mycorrhizal-plant root association that transfers nutrients directly from litter to the plant. The efficiency of the recycling is enhanced by the low natural fertility of the soils. The nature of the recycling is such that losses of cesium occur primarily in the fruit. In certain grazing situations, higher levels in beef and milk can be explained by the ingestion of palmetto fronds, palmetto berries, and acorns. A Cs-134 tracer study is described, and data are presented for Cs-137 levels found in selected soil and plant compartments from a sand pine-scrub oak community (Pinus clausa-Quercus chapmanii, Q. geminata, Q. myrtiflora) and from a mixed hardwood stand in north central Florida. (See also W74-05181) (Houser-ORNL)

FLUORIMETRIC METHOD FOR THE DETERMINATION OF URANIUM IN NATURAL WATERS,
Geological Survey of Sweden, Stockholm.
A. Danielsson, B. Ronnholm, L.-E. Kjellstrom, and F. Ingman.
Talanta. Vol 20, No 2, p 185-192, 1973. Illus.
Identifiers: *Fluorometric methods, Natural waters, *Uranium, *Ion exchange, *Pollutant identification, Organic matter.

A method is described for the fluorimetric determination of U in natural waters. The limit is 0.3 ppm. Ion-exchange is used to preconcentrate the U by a factor of 22 and separate it from quenching ions in the sample. The fluorescence is measured in a medium that is 1.35 M in both sulfuric and phosphoric acids. The uranyl ions are excited by radiation of wavelength 280 nm and bandwidth 40 nm. The emitted signal is scanned from 470-510 nm. After spiking of the sample solution with a small volume of standard U solution, the fluorescence signal is scanned again and the U content of the sample calculated from the 2 readings. The coefficient of variation is 8.5% for determinations of U in a synthetic water sample having a U content of 1.9 ppm. Destruction of organic matter in the eluates gives 0.1 ppm detection limit.--Copyright 1973, Biological Abstracts, Inc.
W74-05240

NEW ULTRAVIOLET RATIO SPECTROPHOTOMETRIC SYSTEM FOR THE DETERMINATION OF TRACE AMOUNTS OF PHENOLIC COMPOUNDS,
Villanova Univ., Pa. Dept. of Chemistry.
J. E. Fountaine, P. B. Joshipura, P. N. Keliher, and J. D. Johnson.
Analytical Chemistry, Vol 46, No 1, p 62-66, Jan 1974. 3 tab, 5 fig, 23 ref.

Descriptors: *Analytical techniques, *Water analysis, *Phenols, *Pollutant identification,

Spectrophotometry, Ultraviolet radiation, Alkalinity, Colorimetry, Color reactions.
Identifiers: Bathochromic shift, ASTM standards, Aminoantipyrine, Cresols, Thymol, Resorcinol, Tyrosine, Microanalysis, Trace analysis.

A newly developed instrument is described which uses two conventional sealed hollow cathode lamps to monitor the UV bathochromic shift that occurs when phenolic compounds are alkalized. This UV ratio spectrophotometer has been used to determine ppb amounts of phenol, o- and p-cresols, resorcinol, thymol, p-methoxyphenol, tyrosine, and similar phenolic derivatives. The UV ratio method generally gives results that are higher than those obtained in colorimetry with 4-aminoantipyrine (ASTM Standard Method D-1783-70), because para-blocked phenols do not react with 4-aminoantipyrine. Among other advantages of the new method is the relatively small sample size required, viz., 50 ml, compared to the 500 ml demanded by the ASTM procedure. (Brown-IPC)
W74-05244

PCB RESIDUES IN PLANKTON FROM THE GULF OF ST. LAWRENCE,
Bedford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
D. M. Ware, and R. F. Addison.
Nature, Vol 246, No 5434, p 519-521, Dec. 21/28, 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Plankton, *Polychlorinated biphenyls, *Pollutant identification, *Particle size, Air pollution, Sea water, Water pollution, Sampling, Aquatic microorganisms, Diatoms, *Canada, Atlantic Ocean.
Identifiers: Prince Edward Island, Nova Scotia, *Gulf of St. Lawrence.

Concentrations of polychlorinated biphenyls (PCB) found in nine standard-net samples of plankta, collected at 10-day intervals from June to Aug. 1972 about 16 km offshore from the northern coast of Prince Edward Island, were found to be inversely related to particle size. This trend persisted despite a 34-fold difference in residue levels between composite samples, indicating that contaminant acquisition is directly proportional to particle surface area. However, spatial and temporal variations in contaminant supply tend to alter the PCB concentratiion vs. particle size relationship. Evidence indicated that PCB are transported from the atmosphere to the sea surface and thence to a plankton. (Brown-IPC)

NEW MEASURING METHODS FOR EVALUATING WASTE WATER QUALITY (NEUERE MESSVERFAHREN ZUR BEURTEILUNG DER ABWASSERQUALITAET),
Herzberger Papierfabrik Ludwig Osthushenrich K.G., Herzberg am Harz (West Germany).
E. Petermann.
Das Papier, Vol 26, No 10A, p 628-631, 635-637, Oct. 1972. 2 fig, 26 ref. English summary.

Descriptors: *Water quality control, Water analysis, Analytical techniques, Waste water(Pollution), *Pollutant identification, *Oxygen demand, *Suspended solids, *Color, *Oily water, Oil pollution, *Pulp wastes, Oil spills, Automation, Pesticides, Chemical oxygen demand, Biochemical oxygen demand, Colorimetry, Monitoring, Effluents, Pulp and paper industry.
Identifiers: Biocides, Permanganate number test.

Methods in use by the pulp and paper industry to evaluate the quality (or polluting effect) of effluent waters are critically assessed, and the need for additional methods is pointed out. Oxygen demand is being evaluated by 5-day BOD, COD, and permanganate number. In addition, most mill effluents are being tested for settleable solids, undissolved (suspended) solids, color, and oil content. The possibilities of automating various test methods are discussed. Disturbances in the 5-day BOD determination caused by the presence of biocides are pointed out. (Wise-IPC)
W74-05259

'BAROVIBRA' BOD MEASURING APPARATUS (BAROVIBRA-BSB-MESSGERAET),
K. Muehleisen.
Der Papiermacher, Vol 22, No 1, p 10-11, Jan. 20, 1973. 4 fig.

Descriptors: *Biochemical oxygen demand, Equipment, *Monitoring, *Industrial wastes, *Instrumentation, Measurement, Waste water(Pollution), *Pollutant identification.
Identifiers: Barovibra BOD monitor.

A highly automated electric instrument for measuring the BOD of effluent samples is described. The apparatus is especially suited for monitoring of industrial waste waters. It is easy to operate and gives reasonably accurate results in a short time. Typical data obtained are given and compared with those derived by other methods. (Speckhard-IPC)
W74-05265

ISOLATION AND CHEMICAL IDENTIFICATION OF TOXIC COMPONENTS OF KRAFT MILL WASTES,
Fisheries Research Board of Canada, West Vancouver (British Columbia). Pacific Environment Inst.
I. H. Rogers.
Pulp and Paper Magazine of Canada, Vol 74, No 9, p 111-116 (Technical Paper T303), Sept. 1973. 4 fig, 5 tab, 18 ref.

Descriptors: *Pulp wastes, *Bleaching wastes, *Pollutant identification, *Toxicity, *Bioassay, Fish, Analytical methods, *Ion exchange, Resins, Cations, Heavy metals, Iron, Copper, Zinc, Chromium, Chlorine, Salmon, *Sockeye salmon, Effluents, Industrial wastes, Water pollution sources, Pulp and paper industry.
Identifiers: Veratrole, Kraft mills, Chlorine compounds, Dehydroabietic acid, Fatty acids, Carboxylic acids, Resin acids.

Toxic organic compounds were isolated from effluents of a bleached kraft mill by a new method, using Amberlite XAD-2 and DEAE-SEPHADEX A-25 ion-exchange resin columns from which organic solutes could be recovered without chemical changes. Bioassays on isolates of different history showed that the mortality of fish (sockeye salmon) was related to the resin acid content of effluents. Resin acids were toxic to young salmon at 2 ppm concentrations in static assays. Dehydroabietic acid was used as a standard reference compound, because of its superior chemical stability. Neutral fractions were nontoxic. Separation of a toxic fraction into its fatty acid and resin acid components indicated that both were toxic. The only chlorinated compound detected was trichloroveratrole (in minor yield). Heavy metals, such as Fe, Cu, Zn, and Cr, made negligible contributions to effluent toxicity. (Brown-IPC)
W74-05270

THE ROLE OF PAPER MILL ADDITIVES AS POTENTIAL STREAM POLLUTANTS -- DEVELOPMENT OF NUCLEAR TECHNIQUES,
Washington State Univ., Pullman. Coll. of Engineering Research Div.
J. C. Sheppard, G. S. Clifton, and G. A. Grant.
Available from the National Technical Information Service as RLO-2221-T3-3, $4.00 in paper copy, $1.45 in microfiche. Research Report No 73/18/6. February 1, 1973. 33 p, 1 tab, 15 fig, 4 ref. RP 1111, AEC contract AT(45-1)-2221 Task 3.

Descriptors: *Pulp and paper industry, *Radioactivity techniques, *Monitoring, *Additives, Chemicals, Analytical techniques, Pollution abatement, *Water pollution sources, *Neutron activation analysis, Radioisotopes, Tracers, Pigments, Beryllium, Zinc radioisotopes, Titanium, Waterproofing, Polymers, Carbon radioisotopes, Microscopy, Tagging, Trace elements.
Identifiers: Coulomb scattering, Rutherford scattering, Americium, Californium, Zinc oxide, Titanium dioxide, Aquapel, Kymene, Alkyl letene dimers, Sizing agents, Wet strength agents, Waterproofing agents, Microtome sectioning, Pulp mills, Paper mills, Papermaking.

The technique of tagging paper additives with metal ions and complexes was found to have serious limitations. Some additives, such as Kymene (a polyamide-epichlorohydrin wet-strength resin) and Aquapel (an alkyl ketene dimer derived from long-chain fatty acids, used as waterproofing and sizing agent), are sufficiently important to papermaking and pollution control to warrant studying their behavior by tagging with carbon-14. Microtome sectioning plus neutron activation was shown to be a powerful tool in determinations of additive distributions in papers. Another technique of potential utility involves Rutherford or coulomb scattering of charged particles from the paper surface. Neutron activation was used to determine the fate of titanium dioxide and zinc oxide fillers or pigments under actual industrial conditions in a paper mill. This method, too, has considerable utility for observing the path of trace metals in paper mill environments. Such studies will help pulp mills in minimizing the loss of costly chemicals and, simultaneously, the discharge of harmful pollutants. A 30-curie neutron source of americium-241 plus beryllium was shown to have limited use in paper mill experiments. However, a higher-flux source of californium-252 may have potential process-control applications, such as the in-line monitoring of clay and titanium dioxide concentrations. (Brown-IPC)

SPECTROPHOTOMETRIC DETERMINATION OF LOW LEVELS OF MONO-, DI-, AND TRIETHYLENE GLYCOLS IN SURFACE WATERS,
Laboratory of the Government Chemist, London (England). Dept. of Trade and Industry.
W. H. Evans, and A. Dennis.
The Analyst (Journal of the Society for Analytical Chemistry), Vol 98, No 1172, p 782-791, Nov 1973. 6 tab, 23 ref.

Descriptors: *Water analysis, *Pollutant identification, *Alcohols, *Carbohydrates, *Organic compounds, Analytical techniques, Oxidation, Spectroscopy, *Spectrophotometry, Color, Colorimetry.
Identifiers: Glycols, Aldehydes, Ethylene glycol.

The method described involves oxidation of glycols to aldehydes with acidified potassium permanganate solution, followed by reaction with 3-methylbenzothiazol-2-one hydrazone to produce green cationic chromogens which are then measured spectrophotometrically at 630 nm. Omitting the oxidation step gives blank samples to compensate for natural interferences. With glycol recoveries of 1-5 mg/liter at precisions of plus or minus 7% from several water samples, the method was sensitive to 0.5 mg glycol/liter. A more sensitive variation of the method for monoethylene glycol alone is also described. (Brown-IPC)
W74-05290

THE QUANTITATIVE DETERMINATION OF CHROMIUM IN URINE BY FLAMELESS ATOMIC ABSORPTION SPECTROSCOPY,
Erlangen-Nuremberg Univ. (West Germany).
K. H. Schaller, H.-G. Essing, H. Valentine, and G. Schacke.
Atomic Absorption Newsletter, Vol 12, No 6, p 147-150, November-December 1973. 3 fig, 2 tab, 18 ref.

Descriptors: *Chemical analysis, *Urine, *Chromium, Methodology, Heavy metals, Pollutant identification, Reliability, Trace elements, *Spectrophotometry.
Identifiers: *Body fluids, Flameless atomic absorption spectrophotometry, Biological samples, Chemical recovery, Precision, Detection limits, Absorbance.

Flameless atomic absorption spectrophotometry is considered to be the most suitable method for the determination of chromium in body fluids. This method has been applied to the direct determination of the chromium content of urine. Fifty microliters of a 24-hr urine sample are injected into an electrically heated graphite tube and the determination made at 358 nm. No prior sample preparation is required. To check the accuracy of the method, 5 micrograms/l Cr was added to urine samples not previously exposed to chromium. The median recovery was 93 percent. To determine precision in a series, one urine sample was analyzed twenty times. With a median chromium concentration of 6.02 micrograms/l and a standard deviation of 0.9 microgram/l, the coefficient of variation was equal to 15 percent. The precision from day-to-day, over the course of one week, expressed as the coefficient of variation was 17 percent at the 6-microgram/l level. The detection limit (equivalent to 1 percent absorption) was 0.2 microgram/l chromium in urine using a sample quantity of 50 microliters, equivalent to 10 pg of chromium absolute. (Holoman-Battelle)

A REVIEW OF WATER ANALYSIS BY ATOMIC ABSORPTION,
Perkin-Elmer Corp., Norwalk, Conn.
R. D. Ediger.
Atomic Absorption Newsletter, Vol 12, No 6, p 151-157, November-December 1973. 88 ref.

Descriptors: *Water analysis, Methodology, *Heavy metals, *Alkaline earth metals, *Alkali metals, *Reviews, Pollutant identification, *Chemical analysis, Filtration, Water sampling, Trace elements, Aluminum, Beryllium, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Surface waters, Sodium, Zinc, *Spectrophotometry.
Identifiers: Atomic absorption, Spectrophotometry, Natural waters, Sample preparation, Sample preservation, Sample storage, Preconcentration, Direct flame atomization, Graphite furnace, Delves cup method, Gaseous hydrides, Arsenic, Selenium, Thallium, Tin, Vanadium, Silver, Detection limits.

A review is presented of the analysis of water samples by atomic absorption. A brief summary of preservation and storage methods is presented, along with information on some of the more useful concentration methods and specialized atomization techniques. Each element of major interest in water quality analysis is considered separately and typical analytical procedures are discussed. (Holoman-Battelle)

A TECHNIQUE FOR EXTRACTION AND STORAGE OF WATER SAMPLES FOR MN, CD, AND PB DETERMINATION BY ATOMIC ABSORPTION SPECTROSCOPY,
Arizona State Univ., Tempe. Dept. of Botany and Microbiology.
R. D. Olsen, and M. R. Sommerfeld.
Atomic Abosorption Newsletter, Vol 12, No 6, p 165-166, November/December 1973. 1 tab, 7 ref.

Descriptors: *Solvent extractions, *Manganese, *Cadmium, *Lead, Methodology, Chemical analysis, Water analysis, Trace elements, Stability, Heavy metals, Separation techniques, Cobalt, Chromium, Copper, Iron, Nickel, Zinc, *Spectrophotometry.
Identifiers: *Metal chelates, Atomic absorption spectrophotometry, Sample storage, Methyl isobutyl ketone.

A method has been developed for stabilizing metal chelates thus allowing extracted metals to be stored for at least 2 weeks at room temperature in an acetone-HCl solution. The stability is attained when the metal chelates are transferred from methyl isobutyl ketone to the acetone-HCl solution. Other limited tests indicate that Co, Cr, Cu, Fe, Ni, and Zn may also be coextracted and stored in acetone-HCl with similar stability. Some signal enhancement associated with MIBK solutions is also retained with the acetone-HCl solution. This technique should permit greater time flexibility in atomic absorption analysis involving multi-element organic extractions of large numbers of water samples. (Holoman-Battelle)

PYROGRAPHIC ANALYSIS OF WASTE WATERS,
Rockwell International Corp., Canoga Park, Calif. Rocketdyne Div.
I, Lysyj.
Environmental Science and Technology, Vol 8, No 1, p 31-34, January 1974. 3 fig, 2 tab, 2 ref.

Descriptors: *Water analysis, *Monitoring, Waste water(Pollution), Mathematical studies, Gas chromatography, Organic matter, Statistical methods, Computer programs, Industrial wastes, Water quality, Water pollution, Degradation(Decomposition), Textiles, Pulp wastes, Poultry, Streams, Waste identification, Water pollution sources.
Identifiers: *Pyrographic analysis, Pattern recognition, Thermal decomposition, Pyrolysis, Characterization.

Based on the theory of multicomponent pattern recognition and differentiation, a new analytical approach represents a fundamental departure from the traditional working concept of analytical chemistry. Multicomponent pattern recognition permits definition of a complex chemical composition as a separate entity, and provides means for studying its interactions with other compositions found in environmental matrices. In the pyrographic method, organic matter is subjected to elevated temperatures in the absence of oxygen, leading to thermal decomposition of organic molecules into several preferential fragments. The nature and quantity of such fragments reflect the elemental and structural character of the parent material. Through identification of the pyrolytically produced derivative composition by means of gas chromatography, the nature of the parent material can be defined. By comparing pyrograms of unknown matter with that of known materials, the qualitative nature of the substance in question could be determined. Analysis of water samples is performed automatically. No sample preparation, such as extraction or separation, is required. Interpretation of data is aided by two computer programs. The technique has been studied and evaluated in waste source identification and differentiation, industrial effluent analysis, control of waste treatment process, characterization of organic content of natural waters, and process control in beer brewing and other fields. Its use for stream monitoring, industrial effluent analysis, and waste treatment control are discussed. (Mortland-Battelle)

PHOSPHATES IN SEDIMENTS OF PAMLICO ESTUARY,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. B. Upchurch, J. K. Edzwald, and C. R. O'Melia.
Environmental Science and Technology, Vol 8 No 1, p 56-58, January 1974. 6 fig, 14 ref.

Descriptors: *Phosphates, *Bottom sediments, *Phosphorus, Freshwater, *Estuarine environment, Mixing, Saline water-freshwater interfaces, Methodology, Inflow, Estuaries, Chemical analysis, Bottom sampling, Aquatic environment, Suspended solids, *North Carolina, Suspension, Sediment transport.
Identifiers: *Pamlico Estuary(N.C.), Pamlico River, Sample preparation.

Of concern is the amount of available phosphorus present in the bottom sediments of North Carolina's Pamlico Estuary along the length of the estuary from a freshwater to an estuarine environment. Bottom sediments were collected at 23 sites from the middle of the Pamlico River with an Ekman dredge. The sediments were frozen, thawed, mixed, dried in an oven at 110 C for 24 hr, and ground. A modified HCl-H2SO4 extraction procedure was used to extract the available phosphorus from the sediments. After extraction the phosphorus was measured using the vanadomolybdophosphoric acid colorimetric method. The amount of 'available' phosphorus extracted from sediment samples along the 35-mile length of the Pamlico Estuary, was observed to decrease from 1.6 mg P/g sediment in freshwater to 0.3 mg P/g sediment in water with a salinity of 18 ppt. A high correlation (r equals 0.99) between available phosphorus and oxalate-extractable iron was found in the upper reach of the estuary (salinity less than 1 ppt). In the lower part of the estuary the Fe-P correlation decreased (r equal 0.86). The decrease in the available P and in the Fe-P correlation along the length of the estuary is consistent with the suggestion that P is held to suspended sediments by some type of Fe-inorganic P complex of limited stability. Suspended materials entering the estuary in the freshwater inflow could lose phosphorus to solution as they are transported through waters of increasing salinity to the mouth of the estuary. (Holoman-Battelle)

MINICOMPUTERS' ROLE IN MONITORING,
Digital Equipment Corp., Maynard, Mass.
R. J. Epler.
Environmental Science and Technology, Vol 8 No 1, p 28-30, January 1974. 1 fig, 1 tab.

Descriptors: *Digital computers, *Data processing, *Monitoring, *Water pollution, *Water quality, Pollutant identification, Automation, X-ray fluorescence, Nuclear magnetic resonance, Instrumentation, Thermal pollution, Radioactive wastes, Magnetic resonance, Water temperature, Hydrogen ion concentration, Electrical conductance, Dissolved oxygen, Oxidation-reduction potential, Gas chromatography, Spectrophotometry, Data collections.
Identifiers: Minicomputers, Analog to digital converters, Microwave spectroscopy.

Many analytical techniques suitable for use in pollutant monitoring lend themselves to use with computers: X-ray fluorescence, microwave spectroscopy, and nuclear magnetic resonance (nmr). Other instrumentation, too, can be used effectively in conjunction with computers. Much of the instrumentation used to monitor pollution can be tied to a computer through appropriate interfacing. Suppose a system is needed to monitor the following parameters in surface water, temperature, pH, electrical conductivity, dissolved oxygen, oxidation-reduction potential, and chloride content. To analyze these parameters in detail, and particularly to interrelate them, would be a difficult task liable to human error. A computer system could be developed that would perform all of these opera-

ions easily, and at the same time, present a total picture. The minicomputer is a key to such a system because it is small, inexpensive, and tolerant of a wide variety of environmental conditions. As an example, the PDP-8/F minicomputer is used as the central element of the system. Each instrument used in the system, such as a pH meter or a conductivity meter, produces an electrical signal that is proportional to the parameter being measured. For the computer to use these signals, two things are necessary: First, the hardware must convert the signals into a form that the computer can use, and second, correct programming must be used. To convert alalog signals into digital form, a converter (ADC) is used, aided by instrumentation-grade analog amplifiers, if necessary. Such a system in a laboratory lends itself to other types of instrumentation, such as gas chromatography, spectrophotmetry, and infrared and ultraviolet spectrometry. (Mortland-Battelle)

POLYCHLORINATED BIPHENYLS IN THE SEASTAR ACANTHASTER PLANCI,
Walla Walla Coll., College Place, Wash. Dept. of Biology.
L. R. McCloskey, and K. H. Deubert.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 5, p 261-264, November 1973. 2 fig, 4 ref.

Descriptors: *Polychlorinated biphenyls, *Pesticide residues, *Gas chromatography, Separation techniques.
Identifiers: *Starfish, Cleanup, Tissue, Echinoderms, Gas liquid chromatography, Thin layer chromatography, Electron capture gas chromatography, Nitration, Biological samples.

Procedures for separating PCB in small amounts of gonad tissue specimens from the starfish Acanthaster planci are described. Cleanup was done using disposable Pasteur pipettes. The columns were filled with Florisil activated for 24 hours at 130 C. Columns were packed in petroleum ether (30-60 C) and washed with 20 ml of petroleum ether prior to use. Extracts equivalent to one to two grams of fixed tissue were used for cleanup and PCBs were eluted with a volume (5-7 ml) of petroleum ether (30-60 C) that eluted 1 microgram of Aroclor 1254 to approximately 96 percent. A solvent blank was run with each extraction. Eluates were concentrated to 0.5 ml, and 1- to 5-microliter aliquots were analyzed by GLC-EC. TLC analysis was also carried out. Nitration of cleaned-up residues did not change the basic peak pattern, except to add new peaks. All tissue extracts produced peaks with the following retention times relative to p,p'-DDE: 0.45, 0.79, 1.0, 1.09, 1.35, 1.70, 2.14, 2.61, and 3.19. These peaks were also obtained with Aroclor 1254, and they did not disappear after nitration. TLC analysis of the extracts produced spots with R sub f values 0.72, 0.80, and 0.92, whereas Aroclor 1254 produced two overlapping spots. Approximate R sub f values were 0.7 and 0.8. The accuracy of the quantitation cannot be determined because of the differences between the peak patterns produced by Aroclor 1254 and the extracts. However, quantities estimated in this study seem to be in agreement with data obtained in similar studies on marine organisms. (Mortland-Battelle)

FIELD IONIZATION MASS SPECTROMETRY: A NEW TOOL FOR THE ANALYTICAL CHEMIST,
Stanford Research Inst., Menlo Park. Calif.
M. Anbar, and W. H. Aberth.
Analytical Chemistry, Vol 46, No 1, p 59-64, January 1974. 9 fig, 11 ref.

Descriptors: *Mass spectrometry, *Spectrophtometry, Ionization, Tracers, Isotope studies, Oil, Chemical analysis.
Identifiers: Field ionization, *Molecular tracers, Isotope dilution, No. 6 fuel oil, Oil characterization, Methaqualone, Phenobarbital, Norchlorpromazine.

Multipoint field ionization sources developed in recent years are discussed in detail and some new applications of mass spectrometry made possible by field ionization are reviewed. This technique provides nonfragmented and isotopically nonscrambled mass spectra which will open up at least two important areas of application: (1) analysis of complex multicomponent mixtures without preparation and (2) isotope dilution analysis by use of multilabeled molecular tracers. Field ionization spectra are shown for methaqualone, phenobarbital, norchlorpromazine, and No. 6 fuel oil. Field ionization mass spectrometry promises to provide a powerful tool in a diversity of fields including environmental research. (Mortland-Battelle)

ANODIC STRIPPING VOLTAMMETRY OF ZINC IN SEAWATER WITH A TUBULAR MERCURY-GRAPHITE ELECTRODE,
Naval Undersea Center, San Diego, Calif. Chemical Oceanography Branch.
S. H. Lieberman, and A. Zirino.
Analytical Chemistry, Vol 46, No 1, p 20-23, January 1974. 5 fig, 2 tab, 14 ref.

Descriptors: *Zinc, *Sea water, *Pollutant identification, Water analysis, Trace elements, Heavy metals, Chemical analysis, Measurement, Flow rates, Cadmium, Lead, Copper, Instrumentation.
Identifiers: *Anodic stripping voltammetry, *Tubular mercury-graphite electrodes, Detection limits, Precision, Accuracy, Mercury graphite electrodes, Reproducibility.

A tubular mercury-graphite electrode (TMGE) has been used to measure zinc in flowing solutions by anodic stripping voltammetry. Fabrication of the electrode and a new method of applying and maintaining a consistently active mercury thin film on a graphite electrode are described. Application of the TMGE to anodic stripping voltammetry of Zn in seawater yields peak currents that are linear with concentration. Measurements are reproducible with a relative standard deviation of plus over minus 9.5 percent at the 0.3 nM level. The system is more sensitive than a comparable static system. Five-minute analysis times permit detection of zinc in sea water at concentrations of 1 nM. The Zn peak current and trace metal peak potentials are described as a function of plating time, rate of solution flow, and other variables. (Holoman-Battelle)

CHARACTERIZATION OF WOOD-PRESERVING COAL-TAR CREOSOTE BY GAS-LIQUID CHROMATOGRAPHY,
Forest Service (USDA), Madison, Wis. Forest Products Lab.
F. H. M. Nestler.
Analytical Chemistry, Vol 46, No 1, p 46-53, January 1974. 3 fig, 6 tab, 12 ref.

Descriptors: *Creosote, *Wood preservatives(Pesticides), *Coal tar coating, Physical properties, Gas chromatography, Aromatic compounds, Organic compounds, Methodology, Distillation, *Chromatography.
Identifiers: Characterization, *Gas liquid chromatography, Retention time, Aromatic hydrocarbons, Precision, Boiling point, Naphthalene, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyls, 2 6-Dimethylnaphthalene, 2 3-Dimethylnaphthalene, Carbazole, Acridine, Acenaphthene, Dibenzofurans, Fluorene, Phenanthrene, Anthracene, 2-Methylanthracene, 9-Methylanthracene, 2-Phenylnaphthalene, Fluoranthene, Pyrene, 2 3-Benzofluorene, Chrysene, n-Eicosane.

Six whole coal-tar creosotes, two of which represent contemporary commercial production, were analyzed by GLC on an SE-30 packing. Retention data for 14 standard compounds were determined for the four liquid phases: SE-30, ApL, OV-17, DEGS. The linear relationship observed between log relative retention in SE-30 and atmospheric boiling point permitted the quantitative interpretation of isothermal chromatograms in terms of a simulated distillation analysis. The latter results agreed very well with precision fractional distillation data, but much less so with the American Wood-Preservers' Association Standard Method. The boiling ranges selected for comparison of the three sets of data were those established for the AWPA Standard Method. (Holoman-Battelle)

USE OF MULTIPLE R SUB F VALUES FOR IDENTIFICATION BY PAPER AND THIN-LAYER CHROMATOGRAPHY,
Wisconsin Univ. Madison. School of Pharmacy.
K. A. Connors.
Analytical Chemistry, Vol 46, No 1, p 53-58, January 1974. 7 fig, 2 tab, 37 ref.

Descriptors: *Chromatography, *Solvents, Statistical methods, Pollutant identification.
Identifiers: R sub f values, Paper chromatography, Thin layer chromatography.

This paper attempts to define how many chromatographic solvent systems should be used in identifying unknowns and how these systems should be selected. Maximum information from chromatography for qualitative analysis is obtained when the R sub fx value for a compound in system X is independent of its value R sub fy in another system Y. It is found, for such systems, that the distribution of points in the R sub fx, R sub fy plane is closed to a Poisson distribution. The number of independent R sub f values required to identify a compound at a specified level of uncertainty can be calculated. Independence of R sub f values is enhanced by using chromatographic systems that are qualitatively different from each other. In many analytical situations, the analyst might make planned use of the considerations presented in this paper. A rough estimate of the size of the population can usually be made. The nature of the distribution of points in the R sub fx, R sub fy plane can be established experimentally, and application of the above guideline experimentally, and application of the above guideline may lead to efficient selection of uncorrelated systems. INDUCTIVELY COUPLED PLASMA-OPTICAL EMISSION ANALYTICAL SPECTROMETRY. A COMPACT FACILITY FOR TRACE ANALYSIS OF SOLUTIONS,
Ames Lab., Iowa.
R. H. Scott, V. A. Fassel, R. N. Kniseley, and D. E. Nixon.
Analytical Chemistry, Vol 46, No 1, p 75-80, January 1974. 8 fig, 3 tab, 35 ref.

Descriptors: *Heavy metals, *Aqueous solutions, *Laboratory equipment, *Trace elements, *Spectroscopy, Water analysis, Aluminum, Calcium, Cobalt, Chromium, Nickel, Lead, Titanium, Zinc.
Identifiers: Plasma-optical emission spectroscopy, Detection limits, Barium, Selenium, Vanadium, Yttrium, Trace levels.

This paper describes a compact inductively coupled plasma-optical emission system for the trace determination of metallic elements in solution. Theoretical considerations are presented to determine operating parameters which agree well with the empirically determined values. The aerosol desolvation system commonly used with this type of source has been eliminated, and pneumatic nebulization is employed in place of the more elaborate ultrasonic method. Some characteristics of the plasma are reported. Detection limits are in the range of 0.1-10 mg/ml for Al, Ba, Ca, Co, Cr, Ni, Pb, Se, Ti, V, Y, and Zn. The facility is readily adaptable to simultaneous multielement trace analysis. (Little-Battelle)

PRESERVATION OF DILUTE MERCURY SOLUTIONS,
Oak Ridge National Lab., Tenn.
C. Feldman.
Analytical Chemistry, Vol 46, No 1, p 99-102, January 1974. 9 fig, 1 tab, 9 ref.

Descriptors: Water storage, *Mercury, *Stability, Water analysis, Aqueous solutions, *Pollutant identification.
Identifiers: *Sample preservation, *Chemical loss, Reference samples, Losses.

Distilled water solutions containing 0.1-10.0 ng Hg/ml were stored for 10 days in glass and polyethylene containers. Those which were untreated, or treated with nitric acid, sulfuric acid plus potassium permanganate, or potassium chromate, lost substantial fractions of their mercury in this period. Solutions stored in polyethylene and treated with 5 percent (v/v) nitric acid plus 0.05 percent chromate ion stayed at full strength for at least ten days. Solutions stored in glass and treated with 5 percent (v/v) nitric acid plus 0.01 percent chromate ion stayed at full strength for as long as five months. The causes of losses in distilled and natural water samples are discussed. (Little-Battelle)

ESTERIFICATION OF (2,4-DICHLOROPHENOXY)ACETIC ACID - A QUANTITATIVE COMPARISON OF ESTERIFICATION TECHNIQUES,
Saskatchewan Univ., Saskatoon. Dept. of Chemistry and Chemical Engineering.
J. Horner, S. S. Que Hee, and R. G. Sutherland.
Analytical Chemistry, Vol 46, No 1, p 110-112, January 1974. 2 tab, 11 ref.

Descriptors: *2 4-D, Gas chromatography, Nuclear magnetic resonance, Chemical analysis, *Chlorinated hydrocarbon pesticides, Herbicides, Methodology.
Identifiers: *Sample preparation, *Esterification, Purity, *Gas liquid chromatography, Mass spectra, Infrared spectra, NMR spectra.

Esterification of 2,4-D with BF3/alcohol mixtures for gas chromatography produces esters in greater than 90 percent yield in 20 minutes with few byproducts. Diazoalkylation is also efficient but produces many impurities. In addition, the reagent is more difficult to make and is more labile than the BF3/alcohol mixtures. Mineral acid catalysis of 2,4-D/alcohol mixtures is time consuming and inefficient. The esters produced by silylation are unstable. The purity of the ester was determined by GLC analysis with thermal conductivity, flame ionization, and electron capture detectors. Mass, infrared, and NMR spectra of the pure compounds were used to confirm the presence of the prepared esters, and the identity of collected compounds separated by thermal conductivity GLC. Retention times of the prepared esters were compared with those of authentic esters. (Little-Battelle)

EFFECTS OF SURFACTANTS ON ATOMIC ABSORPTION ANALYSIS OF DILUTE AQUEOUS COPPER AND NICKEL SOLUTIONS,
Missouri Univ., Rolla. Dept. of Chemistry.
R. L. Venable, and R. V. Ballad.
Analytical Chemistry, Vol 46, No 1, p 131-133, January 1974. 4 fig, 7 ref.

Descriptors: *Aqueous solutions, *Copper, *Nickel, Stabilization, Surfactants, Chemical analysis, Heavy metals, *Spectrophotometry.
Identifiers: *Anionic surfactants, Atomic absorption spectrophotometry, Absorbance, Sodium dodecyl sulfate, Sodium lauryl sulfate, Tetradecylpyridinium bromide, Critical micelle concentration.

Dilute (approximately 3 micrograms/ml) Cu and Ni solutions were analyzed by atomic absorption spectrophotometry upon the addition of the anionic surfactant, sodium dodecyl sulfate (SDS). One effect was the enhancement of absorption in acidic copper and nickel solutions containing SDS above the critical micelle concentration (CMC) over the same acidic copper and nickel concentrations without surfactant present. The second effect seemed to be either prevention of precipitate formation or stabilization of a colloidal dispersion in basic solutions at surfactant concentrations approaching and above the CMC. It was concluded that certain anionic surfactants can cause erroneus results in the AAS analysis of dilute aqueous metal ion solution. However, SDS and maybe other such surfactants can potentially be used to keep metals in solution where acidic pH values are not tolerable. (Holoman-Battelle)

DETERMINATION OF TRACE AMOUNTS OF C2-C5 ACIDS IN AQUEOUS SOLUTIONS BY GAS CHROMATOGRAPHY,
Rome Univ. (Italy). Istituto di Chimica Analitica.
A. Di Corcia, and R. Samperi.
Analytical Chemistry, Vol 46, No 1, p 140-143, January 1974. 4 fig, 1 tab, 14 ref.

Descriptors: *Aqueous solutions, *Gas chromatography, Separation techniques, Organic, Acids, Water analysis, Distillation, *Pollutant identification.
Identifiers: *Fatty acids, Acetic acid, Propionic acid, Isobutyric acid, Butyric acid, 2-Methylbutyric acid, 3-Methylbutyric acid, Valeric acid, Flame ionization detector, Graphitized carbon black, Polyethylene glycol, Phosphoric acid.

An improved chromatographic method is reported for the rapid determination of aqueous solutions of the seven acids at concentrations down to 0.3 ppm, using Graphitized Carbon Black (GCB) modified with appropriate amounts of H3PO4 and polyethylene glycol 20 M. Column packings were prepared by dissolving appropriate amounts of the two phases, H3PO4 and polyethylene glycol (PEG) 20 M (Carlo Erba), in methanol and coating on the GCB by a slurry technique. Methanol was removed with use of a heat lamp. While drying, stirring of these materials must be avoided, as it may cause in some measure crushing of the graphitized carbon particles. Dried materials were revieved to maintain the proper mesh range. Columns made from glass tubings whose dimensions are specified in the captions of the figures were packed by moderately vibrating with the aid of a vibrator. The first four centimeters of the inlet side of each column were left empty to use them as an expansion chamber for injected liquid samples. Columns were then conditioned for 24 hours at 240C. Using a suitably modified GCB surface allows quantitative determinations of C2-C5 acids to be made quite easily even at sub-ppm concentrations. The effect of adding PEG-20 M is twofold: first, it neutralizes residual 'hot sites' and, second, it reduces the surface area available for adsorption of eluate molecules, thus decreasing retention times. (Mortland-Battelle)

ANALYSIS OF PRIMARY AROMATIC AMINES AND NITRITE BY DIAZOTIZATION AND PYROLYSIS GAS CHROMATOGRAPHY,
Massachusetts Univ., Amherst. Dept. of Chemistry.
A. Savitsky, and S. Siggia.
Analytical Chemistry, Vol 46, No 1, p 153-155, January 1974. 3 tab, 13 ref.

Descriptors: *Gas chromatography, *Nitrites, *Aromatic compounds, Water analysis, Aqueous solutions, Pollutant identification.
Identifiers: *Aromatic Amines, *Diazotization, *Pyrolysis gas chromatography, Diazonium salts, Anisidine, Sodium sulfanilate, Metanilic acid, Anthranilic acid, Aminobenzoic acid, Benzidine, Diphenyl amine sulfonic acid, Methyl amine, Phenyl anthranilic acid, Triphenyl amine, Diethyl amine, Accuracy, Precision, Chemical interference.

A pyrolysis gas chromatographic method for analysis of diazonium salts has recently been developed. Since only primary aromatic amines produce stable diazonium salts upon diazotization and only diazonium salts should liberate nitrogen upon mild pyrolysis, adaptation of the pyrolysis gas chromatographic method has been investigated as a specific method for measuring primary aromatic amine content of mixtures. The feasibility of the pyrolysis gas chromatographic technique was demonstrated by analysis of primary aromatic amines of known purity. The percent recoveries by pyrolysis indicate that diazotization proceeds quantitatively and that the manipulation of the diazonium salts preserves them for analysis. Low, though reproducible, results were obtained

for benzidine. Generally the precision and accuracy of the analysis was on the order of 1-2 percent. The analysis of mixtures for primary aromatic amine content was carried out by diazotizing in platinum boats. This was necessary because of insolubility of the products of some secondary and tertiary aromatic amines. The ability of pyrolysis gas chromatography to selectively determine the diazonium salts produced upon reaction with nitrous acid was demonstrated. Analysis of nitrite in nitrate required special modification of the diazotization conditions. Anthranilic acid was chosen for diazotization because its diazonium salt has good water solubility. SETTLING PLATES OF COLD-CURE ACRYLIC PLASTIC REPLICATED FROM NATURAL SURFACES,
McMaster Univ., Hamilton (Ontario). Dept. of Geology.
M. J. Risk.
Limnology and Oceanography, Vol 18, No 5, p 801-802, September 1973. 10 ref.

Descriptors: *Plastics, *Sampling, *Artificial substrates, Algae, Invertebrates, Biological communities.
Identifiers: *Settling plates, Formatray, Acrylics, Colonizing.

Many different substances have been used in the field and in the laboratory as substrates for colonizing communities of plants and animals. 'Formatray', a strong inert, cold-cure dental acrylic, seems to satisfy most of the requirements of an ideal settling plate material. Settling plates were made by pouring mixed Formatray into latex rubber impressions of various surfaces. Latex impressions can successfully be made of almost any natural surface. Formatray has about 40 percent calcium carbonate filler material and chemically approximates a calcareous sandstone or siltstone. A virtually unlimited number of plates can be poured up from one latex impression, thus allowing the operator to place identical plates in different locations or a series of plates, chemically identical and texturally different, in one location. In the field, plates are colonized rapidly and support heavy growths of algae and invertebrates. In a preliminary study in Big Fisherman's Cove, Santa Catalina Island, California, plates set out in shallow water picked up the most common algae settling on rocks in the area. So far, 41 species of algae and at least 11 species of invertebrates have been identified growing on these plates; there seems to be no selective exclusion of groups. (Mortland-Battelle)
W74-05319

PREPARATION OF FILTERED PLANKTON AND DETRITUS FOR STUDY WITH SCANNING ELECTRON MICROSCOPY,
California Univ., Davis. Inst. of Ecology.
H. W. Paerl, and S. L. Shimp.
Limnology and Oceanography, Vol 18, No 5, p 802-805, September 1973. 3 fig, 1 tab, 8 ref.

Descriptors: *Detritus, *Diatoms, *Electron microscopy, Dehydration, Filters, Lakes, Sea water, Sediments, Periphyton, Bacteria, Storage.
Identifiers: *Sample preparation, *Scanning electron microscopy, Sample preservation, Nuclepore filters, Lake Tahoe, Fixation.

A simple, rapid method of fixing plankton and detritus for the scanning electron microscope is described, which can be used in the laboratory or in the field. The sample is fixed with 2 percent glutaraldehyde followed by stepwise dehydration in increasing concentrations of ethyl alcohol. Fixed samples can be stored for up to 2 weeks. Critical point drying of the fixed samples is done in the laboratory. Nuclepore filters proved superior to other filters for most sample preparations. (Mortland-Battelle)

FISH VIRUSES: ISOLATION AND IDENTIFICATION OF INFECTIOUS HEMATOPOIETIC NECROSIS IN EASTERN NORTH AMERICA,
Bureau of Sport Fisheries and Wildlife, Kearneysville, W. Va. Eastern Fish Disease Lab.
K. Wolf, M. C. Quimby, L. L. Pettijohn, and M. L. Landolt.
Journal of the Fisheries Research Board of Canada, Vol 30, No 11, p 1625-1627, November 1973. 1 fig, 1 tab, 11 ref.

Descriptors: *Isolation, *Pollutant identification, *Fish diseases, Methodology, Testing procedures, *Rainbow trout, Viruses, Electron microscopy, Fish eggs, Fry.
Identifiers: *IHN virus, *Infectious hematopoietic necrosis, Histopathology, Salmo gairdneri, Plaque counts, Rhabdoviruses, Sample preparation.

Infectious hematopoietic necrosis virus (IHNV) was isolated from diseased fingerling rainbow trout (Salmo gairdneri) from a hatchery in West Virginia. Clinical signs, histopathologic findings, and origin of eggs provided a basis for diagnosis, and virus was isolated and presumptively identified by plaque characteristics. Serum neutralization tests provided positive identification of the agent as IHNV, and electron microscopy showed its rhabdovirus morphology. Experimental infections resulted in signs of IHNV and death; test fish had characteristic histopathologic alterations and appropriate virus titers. This is the first completely documented occurrence of IHNV beyond the Pacific Northwest. (Holoman-Battelle)

MICROCULTURES OF BROWN BULLHEAD (ICTALURUS NEBULOSUS) CELLS: THEIR USE IN QUANTITATION OF CHANNEL CATFISH (ICTALURUS PUNCTATUS) VIRUS AND ANTIBODY,
Georgia Univ., Athens. Coll. of Veterinary Medicine.
J. B. Gratzek, M. H. McGlamery, D. L. Dawe, and T. Scott.
Journal of the Fisheries Research Board of Canada, Vol 30, No 11, p 1641-1645, November 1973. 2 fig, 3 tab, 9 ref.

Descriptors: *Cytological studies, *Assay, *Pollutant identification, Viruses, Channel catfish, Biochemistry, Fish diseases, Pollutants.
Identifiers: *Microculture methods, *Channel catfish virus, *Quantitative analysis, Brown bullhead, Cell cultures, Ictalurus nebulosus, Ictalurus punctatus, Antibodies, Plaque titration, Herpesviruses.

A microculture system was applied to the culture of brown bullhead (Ictalurus nebulosus) cells and used for the titration of channel catfish (Ictalurus punctatus) virus and corresponding antibody. As few as 17,000 cells/well could be used for routine titrations. Simultaneous inoculation of virus with cells at the time of planting resulted in clearer endpoints as opposed to inoculation of performed monolayers. When channel catfish virus antibodies were measured using plaque reduction and microculture titration assays as indicator systems, no significant differences in antibody titers were noted. PARAFFIN HYDROCARBON PATTERNS IN PETROLEUM-POLLUTED MUSSELS,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
R. C. Clark, Jr., and J. S. Finley.
Marine Pollution Bulletin, Vol 4, No 11, p 172-176, November 1973. 4 fig, 1 tab, 9 ref.

Descriptors: *Marine animals, *Pollutant identification, *Oil pollution, Chemical analysis, Mussels, Organic compounds, Mollusks, Invertebrates, Bottom sampling, Gas chromatography, Separation techniques, Methodology, Baseline studies, Water quality.
Identifiers: *Trace levels, *Paraffins, *Petroleum hydrocarbons, Sample preparation, Data interpretation, Background levels, Hydrocarbons, Aliphatic hydrocarbons, Macroinvertebrates, Mytilus edulis, Mytilus californianus, Crude oil, Lubricating oil, No. 2 fuel oil, Fuel oil.

This paper describes how an analysis of the n-paraffin content and pattern can be used to delineate the accumulation of petroleum hydrocarbons in nature below levels of detectable odour or taste. It is possible to detect very low levels (less than 5 ppb individual n-paraffins n-14C3OH to n-37C76H) of paraffin hydrocarbons in intertidal marine organisms and to use these compounds with suitable baseline information for estimating the quantity of petroleum pollution uptake in the organisms. Under conditions of moderate to major oil pollution, this technique provides a calculation of residual paraffin hydrocarbon pattern in exposed organisms which can be compared to the pollutant hydrocarbon pattern. For low-level persistent pollution, the use of paraffin hydrocarbon patterns and content can often provide an indication of petroleum uptake but, in cases where the pollutant is low in paraffin hydrocarbons (lubricating oils, some crude oils, etc.) or where the rate of bacterial degradation is equivalent to the pollutant input different techniques of analysis are required. Exposed mussels (Mytilus spp.) collected under three differing degrees of suspected petroleum pollution are compared with unexposed control mussels: (1) 'high-level' pollution where a known pollutant was released in a single large discharge; (2) 'moderate-level' pollution where observable quantities of a known pollutant leaked over a long period; and (3) 'low-level persistent' pollution having multiple sources but no continuously visible oil slick on the water surface. DIRECT COUNTS AND PLATE COUNTS OF BACTERIA IN THE DANUBE BETWEEN BERG SPRING AND ULM (IN GERMAN),
Staatl Institut fuer Seenforschung und Seenbewirtschaftung, Langenargen (West Germany).
J. Deufel.
Arch Hydrobiol Supple, Vol 44, No 1, p 1-9, 1972, English summary.
Identifiers: *Bacteria, *Germany(Danube River), *Sewage, Plate counts, Direct counts, Pollutant identification.

In the Berg Spring, and at 7 other stations of the Danube above Ulm, the number of bacteria counted by the direct method, and the number of heterotrophic, saprophytic bacteria were determined. Highest numbers could always be found during low water level below the outfalls of sewers. With the microscopic method numbers ranged from 1900/ml at Berg Spring to 36,000,000/ml at Tuttlingen, and with the plate count method from 49/ml to 640,000/ml at the same stations. The ratio direct count to plate count can be employed only with reservation to indicate the water quality. In spite of a high concentration of bacteria, the bacterial load is smallest at low water-level and highest during floods. Along the section of river investigated the bacterial load increases parallel to the rising flow.--Copyright 1973, Biological Abstracts, Inc.

THE DETERMINATION OF COBALT IN FISH TISSUE BY ATOMIC ABSORPTION SPECTROPHOTOMETRY,
Government Vitamin Lab., Bergen (Norway).
K. Julshamn, and O. R. Braekkan.
Atomic Absorption Newsletter, Vol 12, No 6, p 139-141, November-December 1973. 2 fig, 2 tab, 34 ref.

Descriptors: *Cobalt, *Chemical analysis, *Fish, Trace elements, Heavy metals, Freeze drying, Hydrogen ion concentration, *Spectrophotometry.
Identifiers: Animal tissues, *Atomic absorption spectrophotometry, Sample preparation, Chemical recovery, Detection limits, Precision, Ballan wrasse, Saithe, Sand eels.

A method is described for the determination of cobalt in fish. The samples were prepared for analysis by freeze-drying and homogenization. A portion of 10 g was pre-ashed with infrared heat and then ashed in a muffle furnace at 480C. The residue was dissolved in 0.1 N hydrochloric acid, chelated with ammonium pyrrolidine dithiocarbamate, extracted with methyl isobutyl ketone, and analyzed by atomic absorption spectroscopy. Levels down to 0.01 microgram cobalt per g of fish tissue may be estimated with an average recovery of 96 percent and a coefficient of variation of 5.7-14.2 percent. (Holoman-Battelle)

AN ANALYSIS OF MERCURIALS IN THE ELEPHANT BUTTE ECOSYSTEM,
New Mexico Univ., Albuquerque. Dept. of Biology.
D. E. Kidd, G. V. Johnson, and J. D. Garcia.
Available from National Technical Information Service as PB-228 587 $9.50 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute Report 035, University of New Mexico, Albuquerque, 1974, 125 p, 26 tab, 3 fig, 84 ref. OWRR A-040-NMEX(2).

Descriptors: *New Mexico, *Ecosystems, *Trophic levels, *Mercury, *Fish, Aquatic animals, Food chains, Fish diets, Zooplankton, Turtles, Crayfish, Freshwater fish, Bass, Channel catfish, Laketrout, Carp, Suckers, Walleye, Perches, Mussels, Organic matter, Spectrophotometry.
Identifiers: *Mercurials, *Elephant Butte Reservoir(N. Mex.), Bioamplification, Freshwater mussels, Nonvascular plants, Organic debris.

Samples from Elephant Butte Lake collections were analyzed for mercury by a flameless atomic absorption procedure. Analyses revealed mean ppb mercury concentrations of 0.027 in water, 57 in bottom sediments, 109 in phytoplankton, 277 in attached algae and bryophytes, 95 in plant debris, 69 in zooplankton, 90 in crayfish muscle, 26 in visceral mass of mussels, 97 in muscle of non-predaceous fish, 125 in muscle of small predaceous fish, 253 in muscle of large predaceous fish, and 266 in muscle of two turtle species. Tissue grouped by relative levels for the sixteen fish species show consistently lower levels in bone, skin, gills, and eyes; intermediate levels in stomach, intestine, heart, and brain; and higher levels in spleen, muscle, kidney, and liver. General bioamplification at higher trophic levels appears to be diet related, but the relationship does not hold for lower trophic levels. Mercury levels in water indicate a decreasing gradient from inlet to dam, while sediments display an increasing gradient from inlet to dam. An attempt is made to account for concentrations in some higher trophic level species. Evidence suggests that mercury levels are related to seasonal conditions. A bioamplification scheme and concentration factors are presented which describe the status of mercury concentrations in existing trophic levels. The potential hazards of Elephant Butte fish to human health are discussed. (Hain-New Mexico)

COMPUTER SIMULATION OF THE HYDROLOGIC AND SALINITY FLOW SYSTEMS WITHIN THE BEAR RIVER BASIN,
Utah Center for Water Resources Research, Logan.
R. W. Hill, E. K. Israelsen, and J. P. Riley.
Available from National Technical Information Service as PB-228 650 $4.75 in paper copy, $1.45 in microfiche. Report PRWG104-1, Utah Water Research Laboratory, College of Engineering, Utah State University, Logan, November 1973. 122 p, 18 fig, 3 tab, 54 ref, 6 append. OWRR B-065-Utah(1). 14-31-0001-3658.

Descriptors: *Simulation analysis, Management, *Salinity, *Forecasting, *Hydrologic systems, *Model studies, *Dissolved solids, Discharge(Water), Hydrology, Pollutants, Surface-groundwater relationships, *Utah, Water pollution, Surface waters, Water sampling, Data processing.
Identifiers: Dissolved solids models, Bear River basin(Utah).

Modeling concepts of the hydrologic system are based upon the development of basic relationships describing the hydrologic processes which are linked together by the continuity-of-mass principle. The salinity flow system is then linked to the hydrologic system based on the assumption that the various hydrologic processes change the chemical concentration in the system by storing, concentrating, diluting, and/or picking up additional salts. These processes are identified specifically for irrigated soils and for small storage reservoirs. The amount of storage dilution, concentration or additional pickup is specified during verification of the model. The system response is then used to predict future responses resulting from additional water resource uses. In this study the model was synthesized on the hybrid computer and applied to the Cache Valley subbasin of the Bear River basin. The ability of the model to predict increased salt concentrations is demonstrated. A method for estimating and filling data gaps is also briefly discussed.

RESPIRATION OF A SUBLITTORAL COMMUNITY,
Woods Hole Oceanographic Institution, Mass.
K. L. Smith, Jr.
Ecology, Vol 54, No 5, p 1065-1075, Late Summer 1973. 4 fig, 3 tab, 39 ref.

Descriptors: *Respiration, Biological communities, *Littoral, *Marine animals, Marine bacteria, *Seasonal, Biomass, Benthic fauna, Sediments, Crustaceans, Mollusks, Dominant organisms, Annelids, Oxidation, Bottom sampling, Marine plants, Water temperature, Salinity, Dissolved oxygen, Carbon, Soil temperature, Aquatic soils, Invertebrates, Animal metabolism, Clams, Cores, Chemical reactions, *Georgia.
Identifiers: Sublittoral, *Oxygen consumption, Species diversity, *Sapelo Island(Geo), Species abundance, Nemerteans, Coelenterates, Sipunculids, Echinoderms, Hemichordates, Pogonophorans, Species density, Meiofauna, Species diversity index, Shannon-Weiner diversity index, Sample preparation, Correlation coefficients, Polychaetes, Anthozoans, Notomastus, Glycera dibranchiata, Nephthys picta, Mellita quinquiesperforata, Haliactus, Decapods.

Respiration of a sublittoral community was examined off Sapelo Island, Georgia, from July, 1969 through July, 1970. Total community respiration ranged from 53.7 ml 02/sq m/hr in January to 92.7 ml 02/sq m/hr in July. A positive correlation was found between community respiration and water temperature. Annual community respiration was estimated to be 676.6 liters 02/sq m/yr. The macrofauna consisted of 103 species representing ten phyla. Species abundance ranged from 744 individuals/sq m in July to 14,213 individuals/sq m in March. Biomass (ash free dry wt) increased from 7.3 g/sq m in October to 20.2 g/sq m in March. Macrofaunal respiration comprised from 5 to 26 percent of community respiration. Bacteria were the major functional component of the community accounting for 30 percent to 60 percent of the total respiration. Meiofaunal-microfaunal-microfloral respiration contributed from 25 percent to 58 percent of total community respiration. Sediment chemical oxidation was responsible for 2.8 ml 02/sq m/hr in January to 8.5 ml 02/sq m/hr in July of the total oxygen uptake. (Holoman-Battelle)

SPECIES OF OCEANIC DINOFLAGELLATES IN THE GENERA DISSODINIUM AND PYROCYSTIS: INTERCLONAL AND INTERSPECIFIC COMPARISONS OF THE COLOR AND PHOTON YIELD OF BIOLUMINESCENCE,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
E. Swift, W. H. Biggley, and H. H. Seliger.
Journal of Phycology, Vol 9, No 4, p 420-426, December 1973. 2 fig, 4 tab, 54 ref.

Descriptors: *Marine algae, *Dinoflagellates, *Bioluminescence, Protozoa, Biological properties, Color, Speciation, Phytoplankton, Cultures, Chemical analysis, Methodology, Carbon, Nitrogen, Plant growth.
Identifiers: *Clones, *Bioenergetics, Photon yield, Gonyaulax spp, Pyrocystis acuta, Pyrocystis fusiformis, Pyrocystis noctiluca, Pyrodinium bahamense, Dissodinium lunula, Luciferase.

An examination was made of the bioluminescence of 5 clones of Dissodinium, 1 clone of Pyrocystis acuta, 4 clones of Pyrocystis fusiformis, and 5 clones of Pyrocystis noctiluca. All clones produced the same color bioluminescence with an intensity peak near 474 nm. The in vivo emission spectra of these clones agreed with those previously determined for 4 other species of marine dinoflagellates. The amount of light emitted by the dinoflagellates in scotophase when mechanically stimulated to exhaustion was determined for most of the clones. The largest species, P. noctiluca and P. fusiformis, emitted 37-89 billion photons/cell and 23-62 billion photons/cell, respectively, about a thousand times as much light as Gonyaulax species. Pyrocystis acuta emitted 3-6 billion photons/cell. Three of the 5 clones of Dissodinium were bioluminescent. The range for 3 clones was 5-13 billion photons/cell. All 5 clones of Dissodinium are morphologically distinct. Both the clones of Dissodinium and Pyrocystis produced much higher numbers of photons per cell nitrogen (ca. 7-50 times) than Gonyaulax polyedra or Pyrodinium bahamense. The data suggested that enzyme turnover occurred in the reactions producing light during mechanical stimulation of Dissodinium and Pyrocystis species. (Holoman-Battelle)

DEGRADATION OF PARATHION BY BACTERIA ISOLATED FROM FLOODED SOIL,
Central Rice Research Inst., Cuttack (India). Dept. of Soil Microbiology.
R. Siddaramappa, K. P. Rajaram, and N. Sethunathan.
Applied Microbiology, Vol 26, No 6, p 846-849, December 1973. 3 tab, 13 ref.

Descriptors: *Alluvium, *Microbial degradation, *Pseudomonas, Soil bacteria, Phosphothioate pesticides, Nitrites, Isolation, Metabolism, Aerobic bacteria, Insecticides, Organophosphorus pesticides, Biodegradation, Hydrolysis, *Path of pollutants.
Identifiers: *Parathion, *Bacillus, *Fate of pollutants, Chemical recovery, p-Nitrophenol, Metabolites, Degradation products, Culture media, Flooded soil.

Bacillus sp. and Pseudomonas sp. were isolated from parathion-amended flooded alluvial soil which had demonstrated parathion-hydrolyzing ability. When Pseudomonas was incubated with 50 micrograms of parathion, 19 micrograms of p-nitrophenol was recovered within 4 h of incubation as the hydrolysis product. After 20 h parathion was completely destroyed and no p-nitrophenol could be detected. When Pseudomonas was grown in a N2-free medium with p-nitrophenol as the sole carbon source, nitrite-nitrogen was released in proportion to the amount of p-nitrophenol degraded. Bacillus sp. was incubated as above with 166 micrograms of p-nitrophenol being metabolized, releasing 43 micrograms of nitrite. The bacterium failed to metabolize intact parathion to yield either nitrite or p-nitrophenol. (Holoman-Battelle)

CURRENTS AROUND THE HAWAIIAN ISLANDS. A STUDY OF COASTAL CURRENTS IN RESPECT TO SEWAGE DISPOSAL,
Hawaii Inst., of Geophysics, Honolulu.
D. E. Avery, D. C. Cox, and T. Laevastu.
Report No 26, Interim Progress Report 1, January 1963. 22 p, 13 fig, 3 tab.

Descriptors: *Hawaii, *Currents(Water), Coasts, *Islands, Tides, Circulation, Reefs, Channels, Topography, *Waste disposal, *Path of pollutants, Data collections, Sewage disposal.
Identifiers: *Tidal currents, Littoral currents, Windward, Leeward.

As part of a larger study on the dispersal and transport of waste in coastal areas, this interim report deals mainly with currents. Data gathered during the summer and fall of 1962 are presented in the appendix. Subjects are: nature of tides around the Hawaiian Islands; behavior of tidal currents and their relation to tidal amplitudes; separation of coastal and offshore circulations; influence of depth of water and coastal topography on the coastal currents; currents inside reefs and in channels; surface currents on windward and leeward sides of the islands; change of currents with depth; and currents around sewer outfalls. Connecticut Univ., Groton. Marine Sciences Inst.
W. F. Bohlen.
In: IEEE Conference on Engineering in the Ocean Environment, San Diego, California, September 21-24, 1971. (IEEE Publication 71 C40-OCC) p 238-242, 1971. 18 ref.

Descriptors: *Estuaries, *Diffusion, Turbulence, *Environmental effects, Instrumentation, Models, *Path of pollutants, Tides, *Density stratification.
Identifiers: Bottom roughness.

Evaluation of the diffusion characteristics of an estuary requires an understanding of the turbulence structure and a measure of the range and variability of the eddy diffusion coefficients. Such data are of primary importance to investigators seeking to estimate possible environmental changes through predictive numerical or hydraulic models. A review is presented of the turbulence problem with particular emphasis on estuaries. Both spectral characteristics and spatial scales are considered and related to experimental procedures. Currently available instrumentation is reviewed and its performance criticized. Emphasis is placed on long-term reliability. Both Lagrangianhe summer, deposition is slight becuase of low runoff, southward littoral drift, and northwest winds. The well-mixed estuarine system also precludes the net transport of sediments into the tidal entrance and up the estuarine channel. (Sinha-OEIS)

WATER QUALITY IN ALASKAN CAMPGROUNDS,
Alaska Univ., College. Inst. of Water Resources.
R. S. Murphy.
Available from the National Technical Information Service as PB-228 851, $9.00 in paper copy, $1.45 in microfiche. Report No. IWR-38, 1973. 108 p, 1 fig, 22 tab, 52 ref, 2 append. OWRR B-009-ALAS(1).

Descriptors: *Camping, *Recreational facilities, *Recreational wastes, *Water supply systems, Water quality, Water sources, Waste disposal, Water pollution sources, *Alaska, Potable water.
Identifiers: *Campgrounds.

An evaluation is presented of water quality in Alaskan Campgrounds using laboratory determinations and on-site evaluations. In general, ground water quality was excellent and surface water quality unacceptable for human consumption and total body contact recreation. The most pressing need was the provision of an approved drinking water supply for each campground. The environmental health aspects of campgrounds were found to be largely neglected. Many of the sewage systems are inadequate, resulting in pollution of the ground and surface water. Solid waste was stored and disposed of by unacceptable methods. Finally, many campgrounds are located in swampy areas or in areas subject to annual flooding. (Hartman-Alaska)

AN ANALYSIS OF THE WATER QUALITY PROBLEMS OF THE SAFFORD VALLEY, ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
A. B. Muller, J. F. Battaile, L. A. Bond, and P. W. Lamson.
Available from the National Technical Information Service as PB-228 871, $12.50 in paper copy,

$1.45 in microfiche. Report No. 15, Natural Resource Systems Series, February 1973. 126 p, 26 fig, 17 tab, 22 map plates, 81 ref. OWRR A-999-ARIZ(3).

Descriptors: *Water quality, *Salinity, *Salt tolerance, *Saline water, Artesian aquifers, Agriculture, Groundwater recharge, Social impact, Economic impact, Hydrologic systems, Conductivity, *Arizona, Irrigation water, Crop response, Model studies, Water pollution sources.
Identifiers: *Safford Valley(Ariz).

Changes in groundwater quality averaging 0.13 millimhos electrical conductivity and 35 ppm chloride increase are documented between 1940 and 1972. The decrement in the water quality of the surficial aquifer is attributed to the interaction of four major mechanisms. Brine leakage from underlying artesian aquifers, natural recharge of the surficial aquifer by saline waters, recharge of the aquifer by concentrated agricultural waters, and lateral groundwater movement through saline lacustrine beds appear to be the major salt sources. A chemical thermodynamic computer model of recharge water quality, and the construction of iso-chemical maps from analyzed water samples show artesian aquifer leakage to be the significant contribution of salts to the system. An economic analysis of the Safford Valley, based on the modeling of a 'representative farm' analog, indicates that cotton will remain economical to produce on the basis of the projected salinity trends, for a significant time beyond the limits of prediction of the models employed. A sociologic analysis of the area, based on an extensive questionnaire survey, shows that although the local farmers are aware of the salinity problems in the area they are not greatly concerned by them. (Muller-Arizona)
W74-04976

SOME ASPECTS OF THE ROLE OF USNIC ACID IN FOREST ECOLOGY,
New Mexico Univ., Albuquerque. Dept. of Biology.
Y. C. Rogers.
Available from the National Technical Information Service as PB-228 874, $6.25 in paper copy, $1.45 in microfiche. M Sc Thesis, 1972. 59 p, 7 tab, 3 fig, 38 ref. OWRR A-039-NMEX(3).

Descriptors: *New Mexico, *Ecology, Forestry, Lichens, Bacteria, Microorganisms, Biology, Fungi.
Identifiers: *Usnea tillandsioides, *Usnic Acid, Aboreal lichen.

The objectives were to obtain a measure of the amount of Usnea that falls to the forest floor; to determine if there is any difference between usnic acid production in the summer and the fall; to determine if rainwater is an important factor in leaching usnic acid out of lichen material; and to examine the effects of usnic acid upon soil microorganisms and germinating coniferous seedlings. Usnea tillandsioides, an aboreal lichen, was observed in great numbers on spruce and fir at an elevation of 11,200 feet in the Sangre de Cristo Range, New Mexico. The amount of fallen lichen material per hectare was estimated. Extractions from lichen thallus demonstrated that the quantity of usnic acid was less in summer lichens than in fall lichens. An examination of extracted rainwater did not indicate that usnic acid was being leached from lichens by rainfall. The small amount of usnic acid present in soil and litter samples suggested that decomposition of usnic acid must be taking place. Soil fungi and bacteria cultured in a liquid medium containing usnic acid allowed measurements and extrapolation of these organisms' ability to degrade usnic acid. Coniferous seeds were also subjected to usnic acid and compared for their ability to germinate and form roots under various concentrations. Further experimentation with young trees indicated that usnic acid may be extremely damaging when applied to roots in a concentration of 0.2 mg/ml ethyl acetate. (Creel-New Mexico)

CHARACTERISTICS OF ORGANIC-MATTER DISTRIBUTION IN CALCAREOUS SEDIMENTS OF THE CASPIAN SEA AND IN MESOZOIC CARBONATE ROCKS OF THE SOUTHEASTERN CAUCASUS (OSOBENNOSTI RASPREDELENIYA ORGANICHESKOGO VESHCHESTVA V IZVESTKOVYKH OSADKAKH KASPIYSKOGO MORYA I KARBONATNYKH PORODAKH MEZOZOYA YUGO-VOSTOCHNOGO KAVKAZA),
A. A. Ali-Zade, E. A. Daidbekova, P. A. Shoykhet, and G.-M. A. Aliyev.
Litologiya i Poleznyye Iskopayemyye, No 2, p 30-40, March-April 1973. 2 fig, 3 tab, 11 ref.

Descriptors: *Organic matter, *Organic compounds, *Sediments, *Carbonate rocks, *Mesozoic era, Recent epoch, Sedimentary basins(Geologic), Facies(Sedimentary), Oil, Petrology, Geochemistry, Water pollution sources.
Identifiers: *Caspian Sea, *USSR(Caucasus Mountains), Bitumens.

Distribution of organic matter was investigated in Recent sediments of the Caspian Sea and in Mesozoic rocks of the southeastern Caucasus. Carbonate sediments of enclosed sedimentation basins of the Caspian Sea type exhibit secondary formation of bitumens and hydrocarbons. This process involves both the shallow-water and deep-water facies of the region of present-day carbonate sedimentation. A study was made to trace the lithological-geochemical conditions promoting oil formation in Mesozoic rocks of the southeastern Caucasus. (Josefson-USGS)

MIGRATION OF ELEMENTS IN RIVER WATERS (MIGRATSIYA ELEMENTOV V RECHNYKH VODAKH),
Akademiya Nauk SSSR, Moscow. Geologicheskii Institut.
I. Yu. Lubchenko, and I. V. Belova.
Litologiya i Poleznyye Iskopayemyye, No 2, p 23-29, March-April 1973. 4 tab, 11 ref.

Descriptors: *Geochemistry, *Trace elements, Movement, Rivers, *Dissolved solids, *Suspended solids, Suspension, Turbidity, Colloids, Oxides, Sorption, Filtration, Particle size, *Path of pollutants, Pollutant identification.
Identifiers: *USSR(Black Sea basin).

A study was made of migration of Ti, Fe, Mn, P, Zr, W, Cr, Ni, V, Co, Cu, Pb, Mo, Ga, and Zn in rivers of the Black Sea basin in 1968. Suspended and dissolved solids were separated by filtration through F-5 bacterial filters. The filtrate obtained showed no signs of opalescence, indicating complete separation of the suspended materials, including colloids. Analysis of grain-size distribution of river-water suspensions showed no direct relationship between the content of a given fraction and the general turbidity of water. Topography of the catchment area had little effect on grain-size distribution of the suspensions. Ti, Zr, Cr, and V showed a distinct tendency to accumulate in coarser fractions and Mn, Fe, Ni, Cu, Mo, W, Pb, and Zn in finer fractions. The concentration of elements in solution depends on the general turbidity of water. The migration of elements in solution is affected by sorption processes. The importance of sorption is demonstrated by the removal of amorphous iron and manganese oxides from the samples. Modes of migration of the elements are determined not only by whether the particular element migrates in solution or in suspension but also by the element's sorption activity. (Josefson-USGS)
W74-05022

BASIC PATTERNS IN THE DISTRIBUTION OF CHEMICAL ELEMENTS IN DEEP-SEA SEDIMENTS OF THE BLACK SEA (OSNOVNYYE ZAKONOMERNOSTI RASPREDELENIYA KHIMICHESKIKH ELEMENTOV V TOLSHCHE GLUBOKOVODNYKH OSADKOV CHERNOGO MORYA),
Akademiya Nauk SSSR, Moscow. Institut Okeanologii.
I. I. Volkov.
Litologiya i Poleznyye Iskopayemyye, No 2, p 3-22, March-April 1973. 6 fig, 4 tab, 52 ref.

Descriptors: *Geochemistry, *Trace elements, *Distribution patterns, *Sedimentology, *Bottom sediments, Bottom sampling, Inorganic compounds, Metals, Organic compounds, Organic matter, Recent epoch, Correlation analysis, Water pollution sources.
Identifiers: *USSR(Black Sea), Mediterranean Sea, Organic carbon, Oozes, Sapropel.

A study was made of the vertical distribution of Fe, Mn, Ti, P, Cu, Ni, Co, V, Cr, Mo, W, Zr, Se, Ge, U, $CaCO_3$, and organic C in deep-sea sediments of the Black Sea. The distribution of chemical elements observed in Black Sea sediments is the result of a complex and many-sided geochemical evolution of the basin from Neoeuxinian to Recent time. Unlike the Neoeuxinian deposits, the change in concentrations of elements in Old Black Sea and Recent sediments, reflected in their enrichment in $CaCO_3$, organic matter, and the group of geochemically mobile elements and in their impoverishment in Mn and relatively immobile elements, is due to a number of factors. The most important factor is the weakening of the hydrodynamic regime, which, as a result of intensified differentiation and diminution of the sedimentation rate in deep-sea sediments, has led to a change in the concentration of all elements in the observed direction. Additional factors include increased contents of organic matter in the sediments, occurrence of hydrogen-sulfide contamination in water of the Black Sea, and inflow of Mediterranean waters through the Bosporus. (Josefson-USGS)
W74-05023

AN EVALUATION OF THE EFFECTS OF ESTUARINE ENGINEERING PROJECTS,
Texas Parks and Wildlife Dept. Austin.
R. B. Johnson, Jr.
Available from NTIS as COM-72-11170, price $3.00 in paper copy, microfiche $1.45. Completion Report for Period April 1966 - March 1970, July 1970. 136 p, fig, ref. NOAA 2-12-R.

Descriptors: Texas, *Animal habitats, Fisheries, Ecology, *Coastal engineering, *Powerplants, *Harbors, Levees, *Hurricanes, *Electric power, *Water pollution sources.
Identifiers: Gulf Coast, Ecosystems.

The following were studied: the effects of habitat modification on the fishery ecology of Ceda

Bayou, Texas; the effects of engineering projects on the ecology of Jones Bay, Texas; the effects of engineering projects on the ecology of Moses Lake, Texas; and the effects of habitat modification on the fishery ecology of Trinity Bay, Texas. Studies were set up to determine the extent and quality of nursery environment for commercial and recreational fishery species, and to examine related environmental features, before, during and following construction or habitat modification where possible. Various gear were used to sample the biota. Major types used were bag seines (minnow seines), bar seines, drag seines, otter trawls, marsh nets and plankton two nets. Other samples were taken with Ekman dredge, core tubes, and by hand. Hydrographic studies included sampling for salinity, temperature, turbidity and dissolved oxygen. (Sinha - OEIS)

DISSOLVED OXYGEN AND IRON IN SHALLOW WELLS AT SALISBURY, MD.,
Geological Survey, Towson, Md. Water Resources Div.
S. G. Heidel.
Journal American Water Works Association, Vol 57, No 2, p 239-244, February, 1965. 1 fig, 2 tab, 3 ref.

Descriptors: Wells, *Water wells, Water resources, *Water supply, *Groundwater, Aquifer characteristics, *Iron bacteria, Pollutants, Corrosion, *Oxidation-reduction, *Dissolved oxygen, Hydrogen ion concentration, Pollutant identification.
Identifiers: *Salisbury(Md.), 'Red water', Well efficiency, Production decline.

In September 1962, U.S. Geological Survey was asked to appraise the water resources of the Salisbury, Md., area. The first phase of the study was concerned with an apparent iron problem in the city well field. The municipal supply is obtained from sixteen shallow wells drilled adjacent to Beaverdam Creek. The principal recharge of the producing aquifer, or water-bearing zone, is from surface water sources, including Beaverdam Creek and ponds in the creek created by low dams, and from precipitation that infiltrates the porous soil of the area. Many communities using ground water as their source of supply have reported problems that are similar in some respects to those in the Salisbury wells. Basically, the reported symptoms are that yields of the municipal wells have been decreasing; a thick coating of material resembling iron oxide has been observed on the interior of the pump discharge lines of some wells; periodic analyses of water samples from the wells have revealed increases in total solids; and there have been complaints from some water users that 'dirty' or 'rusty' water is coming from their taps. Several hypotheses for the problems were derived. The methods of investigation, results and conclusions are presented. (Hunt-NWWA)

EFFECT OF WATERSHED AREA OIL FIELDS ON WATER QUALITY,
Shreveport Dept. of Water and Sewerage, La.
A. A. Hirsch.
Journal American Waterworks Association, Vol 56, No 11, p 1474-1480, November, 1964. 6 fig, 3 tab, 3 ref.

Descriptors: Wells, Oil wells, *Water quality, *Water supply, Pollution, *Oil wastes, Saline water, *Flow augmentation, Hardness, Public health, Legislation, *Louisiana, Municipal water.
Identifiers: *Shreveport(La.), Cross Lake(La.), Brine production, Oil field pollution.

Shreveport has drawn its municipal water supply from nearby Cross Lake since January 1926. Its watershed covers 264 sq mi, 63 per cent lying in the western part of Caddo Parish, La., and 37 percent in the eastern part of Harrison County, Texas. In this drainage area are located two important oil fields that extend across the Texas-Louisiana border. As oil production grew in the Cross Lake runoff areas, the quality of the streamflow, as reflected in the salt concentration of the lake water, suffered. Clearly evident from official records is the increasing salt concentration, with recent levels above 150 ppm NaCl far exceeding earlier levels of 15-30 ppm. Waste petroleum brines are characteristically high in salt, with only insignificant amounts of other compounds commonly found in natural waters. The increasing values of the salt to alkalinity ratio establish oil well wastes as the pollutant. Shreveport's various sources of water supply are all intimately connected with the extent of oil well brine releases within their respective watersheds. Unless considerable reduction in the salinity of raw-water supplies is soon apparent, efforts will be required to enact sweeping mandatory regulations for injection. This practice has been adopted under state or federal insistence in other areas, some of them of far less importance than is a metropolitan water supply. (Hunt-NWWA)

REPORT OF THE POLLUTION COMMISSION, PART II: COLLABORATION BETWEEN THE WATER AND OIL INDUSTRIES,
H. Jagger, and L. H. Brown.
In: Eighth Congress of the International Water Supply Association, September 1-5, 1969, Vienna, Austria, p Z25-Z31, (1969). 4 ref.

Descriptors: *Water pollutant sources, Water pollution, *Water pollution control, Oil, *Oil spills, Oily water, Public health, Pipelines, *Oil industry.
Identifiers: *Great Britain.

Although public health and river pollution considerations have given rise to legislation relating to the discharge of harmful and obnoxious effluents over the past century, pollution of fresh water resources by oil is a relatively recent concern. The pipelines, from the mid-1950's, resulted in increased concern by water supply authorities that water pollution of considerable magnitude might result from the failure of one such line. This conference underscores the joint activities of the water and oil industries that have been useful in providing a better mutual understanding of the problems involved and in suggesting steps which are reducing the risks and consequences of pollution of water resources by oil. (Staplin-NWWA)

GROUND WATER SUPPLIES OF NORTHEASTERN ILLINOIS -- QUALITY PROBLEMS WITH WELL WATERS,
Illinois State Water Survey, Urbana. Chemistry Section.
T. E. Larson.
Journal American Water Works Association, Vol 56, No 2, p 169-172, February 1964.

Descriptors: Wells, *Water wells, *Water supply, Water quality, Aquifer characteristics, *Groundwater pollution, Odor, Taste, *Water quality control, *Illinois, *Iron, Hydrogen sulfide, Chlorides.
Identifiers: *Galvanic corrosion, Galesville sandstone, Galena-Platteville formation.

Most problems in well water quality are inherent and not receptive to correction by any means other than external treatment. These problems are usually related to the natural hardness or iron content of the water from the aquifer or from one of the contributing aquifers. Perhaps the most annoying problems are due to the iron content of the water. At times the occurrence of such problems is inexcusable or may be condoned only because of lack of information or adequate interpretation of information. Another less frequently encountered but more objectionable problem is that of hydrogen sulfide in well waters. This 'rotten-egg' odor almost always demands treatment. Case studies of these problems, their causes and corrective measures taken in 3 aquifers are presented. It is concluded that in many cases the pollutants enter the well from outside the producing zone due to improper or nonexistent sealing; however, it should be remembered that preventive measures taken during construction are usually superior to and less costly than corrective measures. WORKBOOK OF THERMAL PLUME PREDICTION: VOLUME 1, SUBMERGED DISCHARGE,
Pacific Northwest Water Lab., Corvallis, Oreg.
M. A. Shirazi, and L. R. Davis.
Copy available GPO Sup Doc as EP1.23/2:72-0053, $1.75; microfiche from NTIS as PB-228 293, $1. 5. Environmental Protection Agency, Technology Series Report EPA-R2-72-005a, August 1972. 228p, 8 fig, 12 tab, 7 ref. EPA Project 16130.

Descriptors: *Jets, *Thermal pollution, Publications, *Discharge(Water), *Distribution patterns, Water pollution effects, Heated water, Forecasting, Water pollution sources.
Identifiers: Submerged jets, *Nomograms, *Thermal plumes, *Submerged discharge.

This workbook contains computational procedures in the form of nomograms designed to satisfy several needs related to the discharge of thermal waste into large bodies of water. They provide estimates of physical spread and temperature distribution around the discharge point for the assessment of biological and physical effects of heated water. They can be used as guidelines for setting temperature standards and for monitoring. Finally, they have utility in pre-design feasibility analyses and outfall performance estimates. Data and analyses from numerous sources constitute the backup material for this publication. An attempt has been made to unify and present the material in a format that is sufficiently simple for a non-specialist user. A number of illustrative examples are presented which demonstrate the use of each set of nomograms in practical problems. The status of analysis at this time is not sufficiently advanced to encompass a wide range of experimentally verified predictive models. For this reason, care must be exercised when applying the generalized nomograms to specific situations. The major restrictions for each set of nomograms are outlined in the text which the user is advised to review carefully. In general, the nomograms provide meaningful qualitative information for a wide range of problems of practical interest, but their use is subject to scrutiny and proper interpretation when applied to exacting design conditions. REGRESSION TECHNIQUES FOR ESTIMATION OF SULFATE IN STREAMS DRAINING AN AREA AFFECTED BY COAL MINING,
Geological Survey, Louisville, Ky. Water Resources Div.
H. F. Grubb, and P. D. Ryder.
In: Proceedings of 3rd Annual Environmental Engineering and Science Conference, March 5-6, 1973, Louisville, Ky: University of Louisville Speed Scientific School, p 127-137, 1973. 7 fig, 2 tab, 2 ref.

Descriptors: *Regression analysis, *Monitoring, *Sulfates, *Acid mine water, *Coal mines, Mine acids, Data processing, Statistical methods, *Kentucky.
Identifiers: *Tradewater River basin(Ky).

The Tradewater River basin above the U.S. Geological Survey stream-gaging station at Olney, Ky., has been extensively mined for coal by both underground and strip-mining methods. A relationship between specific electrical conductance (X) and sulfate concentration (Y) can be represented by a simple linear regression equation of the form $Y = a + bX$. The regression coefficients a and b were determined using data from 465 chemical analyses made over a 17-year period at the Olney Station. Reduction of the standard error of about 40% was achieved by removing 16 data points representing water anomalously high in bicarbonate and associated with rainfall and runoff from the western, nonmined portion of the basin. Sulfate concentration, estimated from specific conductance measurements and the relationships $\log Y = -1.015 + 1.242 \log X$, was compared to the sulfate concentration in 96 water samples collected from the Tradewater River at Olney since 1966. The maximum error of prediction was 26%, and 89% of the estimated values were within 10% of the observed sulfate concentrations. The long-term effects of coal mining on stream water chemistry can be monitored with specific conductance and only a limited number of chemical analyses to verify the stability of the sulfate-conductance relationship. MICROBIAL DEGRADATION OF PETROLEUM IN CONTINENTAL SHELF SEDIMENTS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
P. G. Hunt, F. R. Koutz, R. P. Murrmann, and T. G. Martin.
Special Report 196, December 1973. 16 p, 5 fig, 2 tab, 38 ref, append.

Descriptors: *Oil spills, *Contential shelf, *Biodegradation, *Path of pollutants, Bottom sediments, Oil pollution, Aerobic conditions.

A study was conducted to determine whether petroleum waste products deposited in surficial sediments of the United States Continental Shelf would be subject to microbial degradation. Degradation of these waste products should occur under the aerobic conditions commonly present in the sediments, but under anaerobic conditions, degradation of hydrocarbons should be extremely slow. It was verified, using carbon-14 labeled hydrocarbons, that degradation of petroleum in sediments occurs when oxygen is very limited; however, several hundred years would be required for complete degradation to occur. ENVIRONMENTAL ACTIVITIES AND PROGRAMS AT THE SAVANNAH RIVER PLANT.
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
Available from NTIS, Springfield, Va., as Rept. No. DPST-73-436, $4.00 per copy, $1.45 microfiche. Report No. DPST-73-436, Sept. 1973. 23 p.

Descriptors: *Environment, *Monitoring, *Radioactivity, Rivers, *Nuclear powerplants, Nuclear wastes, Effluents, Streams, Administration, Standards, Regulation, Water pollution safety, Public health, Ecology, Forests, Limnology, Meteorology, Fuel, Fabrication, Radioactive waste disposal, Food chains, Transport depletion, *South Carolina.
Identifiers: *Savannah River(So Car).

The Savannah River Plant consists of three operating nuclear production reactors, two separations areas for processing irradiated materials, a heavy water extraction and recovery plant, reactor fuel fabrication facilities, the Savannah River Laboratory (a process development laboratory to support production operations), and the many non-nuclear facilities necessary for plant operations. The purpose and operation of the plant activities and the funded programs to modify the impact of potential or actual releases to the environs are described. Inasmuch as the plant processes are quite complex, this report does not describe any of the activities in depth nor does it delineate in detail the results of the various emission controls, environmental research, and environmental monitoring programs. Rather, the report gives general descriptions of these activities. For fiscal year 1974, the operating budget for the plantsite is about $125 million; about 10% of this amount is spent for environmentally oriented activities. (Houser-ORNL)

RADIOLOGICAL EVALUATIONS FOR ADVANCED WASTE MANAGEMENT STUDIES,
Battelle-Pacific Northwest Labs., Richland, Wash.
D. H. Denham, D. A. Baker, J. K. Soldat, and J. P. Corley.
Available from NTIS, Springfield, Va., as Report No. BNWL-1764. $5.45 per copy, $1.45 microfiche. Report No. BNWL-1764, Sept. 1973. 71 p, 7 fig, 22 tab, 28 ref, 6 append.

Descriptors: *Radioactive waste disposal, *Nuclear powerplants, Effluents, *Air pollution, *Water pollution, Soil contamination, Management, Regulation, Social aspects, Public health, Benefits, Cost-benefit analysis, Cost-benefit theory, Radioisotopes, Strontium, Cesium, Model studies, Mathematical models, *Computer models.

The overall risk evaluation for various radioactive waste management concepts includes calculations of radiation doses to individuals and local populations. Radiation doses are the most appropriate measure of the consequences of unforeseen releases of radioactive materials to the environment and dose criteria are available by which the severity may be judged. A comprehensive dose computational model, developed and used for other Atomic Energy Commission studies, has been adopted to improve its flexibility and to assist in evaluating alternative means for disposal of high-level waste. Typical input terms for normal use include source terms (radionuclide release rates to man's immediate environment) and dilution factors. Outputs include individual pathway doses and total doses to maximum individuals for both an urban and a rural population. Whole body doses plus doses to other critical organs are obtained, as well as the fractional dose contribution of individual nuclides. Doses for one year or total doses for fifty years of exposure are available. (Houser-ORNL)

ENVIRONMENTAL MONITORING. ANNUAL REPORT, 1972, (ATOMICS INTERNATIONAL)
Atomics International, Canoga Park, Calif. Health, Safety and Radiation Services Dept.
J. D. Moore.
Available from NTIS, Springfield, Va., as Report TID-26442, $4.00 per copy, $1.45 microfiche. Report TID-26442, 1972. 27 p, 7 fig, 8 tab, 3 ref, 3 append.

Descriptors: *Monitoring, *Environment, *Background radiation, *Radiation, *Nuclear explosions, Safety, Toxicity, Public health, Soils, Vegetation, Water, Air, Survey, Measurement.
Identifiers: *Weapons testing.

Environmental monitoring at Atomics International is performed by the Operational Safety and Waste Management Unit of the Health, Safety and Radiation Services Department. Soil, vegetation, water, and air are routinely sampled up to a distance of 10 miles from Atomics International sites. Site perimeters are monitored for radiation levels by means of thermoluminescent dosimeters. The environmental radioactivity reported herein is attributed to natural causes and to nuclear weapons testing, rather than to Atomics International operations. The environmental monitoring program provides a measure of the effectiveness of the Company's radiological safety procedures and of engineering safeguards incorporated into facility designs. Available from NTIS, Sprinfield, Va., as Rept. No. EGG-1183-1591, $4 per copy, $1.45 microfiche. Report No. EGG-1183-1591, May 1, 1973. 21 p, 3 fig, 3 tab, 3 ref.

Descriptors: Survey, *Radioactivity, *Measurement, *Air pollution, Water pollution, *Water pollution sources, Soil contamination, Nuclear powerplants, Effluents, Public health, *Remote sensing, *Minnesota.
Identifiers: *Elk River(Minn).

The Aerial Radiological Measuring System (ARMS) was used to survey the area surrounding the Elk River experimental power reactor during August and September 1968. The survey measured terrestrial gamma radiation. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 900 square mile area showing isoexposure contours three feet above the ground. Exposure rates and isotopes identified are consistent with normal terrestrial background radiation. (Houser-ORNL)

AN ECOLOGICAL APPROACH TO THE EVALUATION OF RADIOACTIVITY WITHIN THE MAN-ENVIRONMENT ECOSYSTEM,
Emory Univ., Atlanta, Ga.
R. B. Platt, H. L. Ragsdale, and D. J. Shure.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971. Oak Ridge, Tennessee, (1971) p 9-17, 5 fig.

Descriptors: *Radioactivity, *Environment, *Ecology, *Evaluation, Assay, *Measurement, Appraisals, Assessment, *Ecosystems, Quality control, Forecasting, Balance of nature, Eurthrophication, Food chains, Biota, Biorhythms, Computer programs, Data storage and retrieval, Meteorology, Hydrology.

Both a philosophy and a plan of action are are presented for an ecosystem approach to the measurement and evaluation of radioactive nuclides in the environment. Methods currently in use are generally restricted to an analysis of those environmental components directly related to man. Yet man's welfare depends also on the long-range quality of his total environment. For example, it is becoming apparent that negative feedbacks to man originate in natural systems. Thus, the prediction and discovery of trends of environmental change must be based on the entire network of trophic and subsystem transfers. Irreversible environmental problems usually arise through couples among biotic subsystems. Reversals of potential threats to man are least expensively made by understanding and regulating inputs to natural systems. Changes become irreversible or expensively reversible when detected in food chains coupled directly to man. Food chains are treated functionally as natural, recreational, and domestic, with each of these assigned to the primary environmental components, including man. Computer programming provides for data storage, systems analysis of the data with respect to base lines and trends, and both tabular and graphic data displays. (See also W74-05181) (Houser-ORNL)
W74-05182

RADIONUCLIDES IN THE ENVIRONMENT AT NUCLEAR POWER STATIONS,
Environmental Protection Agency, Cincinnati, Ohio. Radiochemistry and Nuclear Engineering Branch.
B. Kahn.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 30-36, (1971), 1 fig, 4 tab, 10 ref.

Descriptors: *Radioactivity, *Environment, *Nuclear powerplants, Effluents, Ecology, *Radioecology, Monitoring, Ecosystems, Aquatic life, Air pollution, Water pollution, Public health, *Path of pollutants, Survey, Assay, Measurement, Food chains.
Identifiers: *Surveillance program.

The radionuclides that can be found in the environment of commercial nuclear power stations are indicated, problems of environmental surveillance are discussed, and topics of radioecological research in this area are suggested. The information on radionuclides in the environment is derived from radionuclide release data and routine environmental monitoring by the stations and from field studies at several stations. The results show that several radionuclides are readily detectable in the aquatic ecosystem at many or all stations. Measurement of radioactive gases in ground-level air at several stations can be used to determine dispersion of stack effluents in air. Little or no radioactivity from the stations has been found in the terrestrial ecosystem. (See also W74-05181) (Houser-ORNL)

ENVIRONMENTAL ASPECTS OF NATURAL GAS STIMULATION EXPERIMENTS WITH NUCLEAR DEVICES,
California Univ., Livermore. Lawrence Livermore Lab.
L. R. Anspaugh, J. J. Koranda, and W. L. Robison.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 37-52, (1971) 5 fig, 10 tab, 58 ref.

Descriptors: *Environment, *Natural gas, *Secondary recovery(Oil), Benefits, Cost-benefit ratio, *Air pollution, Water pollution, Food chains, Public health, Food, Milk, Vegetation, Path of pollutants, Tritium, Krypton radioisotopes, *Radioecology, *Nuclear explosions, Computer models.
Identifiers: Project Rulison.

It is likely that future activities administered by the USAEC Division of Peaceful Nuclear Explosives will be in the area of underground engineering, and particularly in the stimulation of deeply buried natural gas reservoirs of low permeability. The successful development of this technology could double the proved recoverable resources of natural gas in the United States. During the developmental stage of the technology, large quantities of THO are released to the environment as the gas is withdrawn. Efforts to predict potential doses resulting from such releases have been severely handicapped by the lack of adequate data to predict the ecological movement of THO. A radio-ecological study was conducted in conjunction with Project Rulison, the second nuclear-stimulation experiment, to evaluate these parameters; controlled laboratory studies were also initiated. The results indicate that the environmental residence time of THO is at least an order of magnitude shorter than has been frequently assumed, and that this invalidates the commonly used deposition velocity approach for the calculation of doses due to food chain contamination by THO vapor. A simple but realistic model is developed based on these findings to predict the dose to man via the forage-cow-milk, forage-cattle-beef, vegetation, and inhalation pathways. The dose predicted by this model for the Rulison area residents is 10 to the third power to 10 to the fourth power lower than the preflaring estimates made by a variety of organizations. THE YEAR 2000 -- NUCLEAR POWER AND MAN,
Division of Reactor Development and Technology (AEC), Washington, D.C.
S. Strauch.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 53-62, (1971) 15 fig.

Descriptors: *Nuclear powerplants, *Radioactivity, Effluents, *Environment, Assessment, *Forecasting, River basins, Mississippi River, Missouri River, Ohio River, Lake Michigan, *Path of pollutants, Food, Water, Food chains, Population, Public health, Computer programs, Model studies, *Computer models.

A study was initiated by AEC in January 1970 to develop a computer model and necessary data to permit estimates of potential doses and dose commitments to individuals and population groups as a result of selected release rates from reactors and fuel reprocessing plants in a large geographic region. The model is of the sophistication warranted for 30 years forecasting purposes and of sufficient generality and scope to permit it to eventually encompass the contiguous United States. The study is being conducted by the Hanford Engineering Development Laboratory at Richland, Washington, with the assistance of Battelle Memorial Institute under the direction of the AEC Division of Reactor Development and Technology and the Director of Regulation. The model is being applied initially to the Upper Mississippi River Basin for the nuclear facilities which are projected to be located in that region by the year 2000. Exceptional care is being taken to ensure that all radionuclides and their associated pathways that lead to significant doses are included in this initial development phase of the model. GAMMA-EMITTING RADIONUCLIDES IN ALASKAN ENVIRONMENTS 1967-1970,
California Univ., Livermore. Lawrence Livermore Lab.
J. J. Koranda, and J. R. Martin.
In: CONF-710501-P1 -- Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 81-107, (1971) 5 fig, 19 tab, 23 ref.

Descriptors: *Environment, *Sampling, *Radioactivity, *Assay, *Measurement, Evaluation, Safety, Air pollution, Water pollution, Soil contamination, Vegetation, Lichen, Fallout, Cesium, Nuclear explosions, Radioisotopes, *Alaska.
Identifiers: China, *Amchitka Island(Alas).

Environmental samples were collected at several sites in Alaska to determine the present status of radionculides in Alaskan environments, with special emphasis on Amchitka Island. Samples were obtained on Amchitka Island, the coastal Alaska near Anchorage, and in central Alaska in the Fairbanks area. Lichens, grasses, herbs, and shrubs were collected along the Amchitka Island to Fairbanks transect of Alaskan environments. Radionuclide concentrations were determined by scintillation crystal and solid-state gamma spectroscopy. Cesium-137 was the most abundant radionuclide found in the northern environments, with low but detectable concentrations of Eu-155, Sb-125, Ce-144, and Mn-54 also being present. Fallout from recent Chinese tests produced increased levels of Zr-95/Nb-95 in the 1970 samples. Lichens have the highest concentrations of Cs-137, but evergreen vascular plants also had Cs-137 concentrations in the same range as those found in lichens. Plants with an annual topgrowth, such as grasses, had low to nondetectable concentrations of radionuclides. These data describe radiometric base lines pertinent to current testing programs being conducted in the Aleutian Islands and relate those base lines to those occurring elsewhere in the high latitudes. (See also W74-05181) (Houser-ORNL)
W74-05187

RECENT MEASUREMENTS OF CESIUM-137 IN RESIDENCE TIME IN ALASKAN VEGETATION,
California Univ., Livermore. Lawrence Livermore Lab.
J. R. Martin, and J. J. Koranda.
In: CONF-710501-P1, Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 108-115, (1971) 5 fig, 1 tab, 25 ref.

Descriptors: *Monitoring, *Measurement, *Cesium, *Vegetation, *Lichens, Ecology, Ecosystems, Water pollution, Fallout, Sampling, Assay, Data collections, Radioecology, Absorption, Cycles, Food chains, Public health, Radioisotopes, *Alaska, *Path of pollutants.
Identifiers: Residence half-time, Aleutian Islands(Alas), Anchorage(Alas).

Radionuclide concentrations in Alaskan plant species were measured in the period 1967-1970 when incoming fallout was a small fraction of the accumulated inventory present in the vegetation. Samples were collected in five geographic areas from the western Aleutians to the interior of Alaska. Radionuclide concentrations in 150-g aliquots of dried, ground, and compressed samples were measured by scintillation gamma spectrometry. The residence half-time for Cs-137 in Cladonia sp. lichens was approximately three years on Amchitka Island and the coastal area near Anchorage, Alaska. In central Alaska near Fairbanks and in the mountains near Anchorage, the residence half-time for Cs-137 in lichens was about eight years. Evergreen vascular plants from these higher elevation sites had residence half-times of only one to three years. (See also W74-05181) (Houser-ORNL)
W74-05188

RADIONUCLIDE BIOMAGNIFICATION IN COASTAL-PLAIN DEER,
Georgia Univ., Athens. School of Forest Resources.
J. H. Jenkins, and T. T. Fendley.
In: CONF-710501-P1 -- Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 116-122, (1971) 5 fig, 4 tab, 14 ref.

Descriptors: *Monitoring, Measurement, *Radioisotopes, *Cesium, *Strontium, *Deer, Southeast region, Fallout, Water pollution, Absorption, Food chains, Public health, Radioecology, Vegetation, Bioindicators, Biology, Bioassay, Atlantic Coastal Plain, Gulf Coastal Plain.
Identifiers: *Bioaccumulation.

Muscle samples have been obtained from over 1000 deer throughout the Southeast during the past five years and analyzed for radionuclides. Deer from the Lower Coastal Plain region had consistently higher levels of Cs-137 than deer from the Upper Coastal Plain, Piedmont, Central Plateau, and Mountain regions. In the Lower Coastal Plain, deer muscle average 45,000 pCi/kg of Cs-137, with some specimens ranging up to over 150,000 pCi/kg. Animals from the other provinces averaged around 4000 pCi/kg. Evidence that Sr-90 is effectively transported through the Lower Coastal Plain environment also. Strontium values in deer were comparable to the values found in Arctic herbivores, while the Cs-137 values are higher than were found in the Arctic. Potassium deficiency in vegetation probably increases radionuclide bioaccumulation. Cropland vegetation is 20X higher in potassium and has only 1 to 3% as much radioactive cesium as forest and swampland vegetation. Bioaccumulation in wildlife may well become a classic example of radionuclide cycling. Data indicate that the sterile, sandy soils of the Lower Coastal Plain in combination with high water tables and some specific radionuclide-concentrating plants produce the conditions which result in biomagnification of Cs-137 and Sr-90 in deer. (See also W74-05181) (Houser-ORNL)
W74-05189

CESIUM-137 IN WHITE-TAILED DEER AS RELATED TO VEGETATION AND SOILS OF THE SOUTHEASTERN UNITED STATES,
Eastern Environmental Radiation Lab., Montgomery, Ala.
S. L. Cummings, J. H. Jenkins, T. T. Fendley, L. Bankert, and P. H. Bedrosian.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 123-128, (1971) 1 fig, 4 tab, 15 ref.

Descriptors: *Monitoring, *Measurement, *Cesium, *Deer, *Southeast U.S., Vegetation, Soils, Radioecology, Sands, Assay, Soil analysis, Leaching, Ion transport, Soil water, Absorption, Atlantic Coastal Plain, Gulf Coastal Plain.

Data are presented for Cs-137 in white-tailed deer and vegetation of the southeastern United States along with information as to the nature of the associated soils. The concentrations of Cs-137 in some of the vegetation were of sufficient magnitude to account for the Cs-137 concentrations found in the deer. The highest Cs-137 concentrations in deer were associated with the humic-gley soils along the Atlantic and Gulf Coasts. These soils are predominately sandy in nature and have relatively low fixing capacities. The concentrations of Cs-137 in the vegetation grown on the humic-gley soils under natural and controlled conditions were greater than from the gray-brown podzolic and red-yellow podzolic soils. (See also W74-05181) (Houser-ORNL)
W74-05190

DISTRIBUTION OF CESIUM-137 IN A SMALL WATERSHED IN NORTHERN MISSISSIPPI,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
J. C. Ritchie, J. R. McHenry, A. C. Gill, and P. H. Hawks.
In: CONF-710501 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 129-132, (1971) 2 fig, 4 tab, 11 ref.

Descriptors: *Fallout, *Cesium, *Monitoring, Measurement, *Watersheds(Basins), *Mississippi, Distribution, Sediment distribution, Ecological distribution, Model studies, Hydrologic data, Hydrologic models, Movement, Diffusion, Dispersion, Transfer, Sediment transport, Entrainment, Path of pollution, Erosion.

Concentration of fallout Cs-137 in soils and sediments of a small watershed in north Mississippi was measured to determine the redistribution of fallout Cs-137. Measured concentration of Cs-137 ranged from 8.9 nCi/sq m in soils from actively eroding areas to 412.2 nCi/sq m in conservation pool sediments. A model was constructed for the distribution of Cs-137 in the watershed. Sixty-one percent of the Cs-137 in the conservation pool sediments was derived from the movement of Cs-137 from the contributing watershed. Of the Cs-137 moved from the watershed, 53% was contributed from the eroded areas which presently occupy 4% of the contributing watershed area. The efficiency of the reservoir for trapping or retaining Cs-137 carried into it from runoff was 57%. Of the total Cs-137 deposited in the watershed, less than 7% moved from the contributing watershed and only 3% of the Cs-137 deposited in the watershed moved through the reservoir outlets. CESIUM-137 SOIL INVENTORY OF A TAGGED LIRIODENDRON FOREST 1962 AND 1969,
Oak Ridge National Lab., Tenn.
C. W. Francis, and T. Tamura.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 140-149, (1971), 5 fig, 9 tab, 14 ref.

Descriptors: *Cesium, *Absorption, *Soils, *Radioactive tracers, *Tracking techniques, *Path of pollutants, Absorption, Cycles, Forest, Forest soils, Root systems, Soil-water-plant relationships, Minerals, Sorption, Radioecology, Ecosystems, Ion exchange, Clays, Research and development.

The soil has become a major sink for Cs-137 innoculated into Liriodendron in 1962. The distribution of this radionuclide within the soil profile and among soil fractions was determined in soil samplings of late fall 1962 and summer 1969. The much higher concentractions of Cs-137 in the clay fraction (1962 samplings) at a soil depth of 6 cm (11.1 pCi/mg) as compared with that at 4 and 9 cm (4.8 and 1.1 pCi/mg respectively) indicates that most of the innoculated Cs-137 entered the soil through the roots rather than by transfer from rainfall or litter fall. This conclusion is also supported in that soil (< 0.250 mm) separated from fine roots by ultrasonics contained nearly twice the Cs-137 concentration of that separated from bark, small stones, etc. The 1969 soil sampling indicated that some downward accumulation of Cs-137 occurred after 1962; for example, the concentration at soil depth of 14 cm (0.67 pCi/mg) in 1969 was higher than the 0.31 pCi/mg determined at a

epth of 9 cm in 1962. Also, in the 1969 sampling here was no evidence of a Cs-137 concentrating henomenon at the 6-cm depth as there was in the 962 sampling. Separates obtained through density radient zonal centrifugation indicated greater han 90% of the Cs-137 on soil is associated with he mineral soil components. Of the mineral com-onent, the bulk of the Cs-137 appears to be as-ociated with the predominant soil clay minerals, aolinite and chlorite; however, there does seem o be a certain amount of selective concentration f Cs-137 in the micaceous minerals. ERSISTENCE OF RADIONUCLIDES IN SOIL, LANTS, AND SMALL MAMMALS IN AREAS ONTAMINATED WITH RADIOACTIVE FAL-OUT,
alifornia Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
. M. Romney, W. A. Rhoads, A. Wallace, and R. . Wood.
n: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-2, 1971, Oak Ridge, Tenn. p 170-176, (1971), 1 fig, tab, 32 ref.

Descriptors: *Radioecology, Radioactivity, Ecology, *Soil contamination, Small animals(Mammals), Fallout, Nuclear explosions, Cesium, *Strontium, Sorption, Testing, Movement, Abiotic environment, Biota, Biorhythms, Food chains, *Radioisotopes, Root systems.

The persistence of radionuclides in soil, plants, and small mammals was investigated periodically in areas contaminated with fallout from boveground nuclear detonations at the Nevada Test Site. Study sites were established at various ocations out to about 225 km from ground zero. Emphasis was placed upon the movement of Sr-90 nd Cs-137 from abiotic to biotic components. Several neutron activation products also were studied in fallout areas located within 5 km of nuclear xcavation tests. Radio-nuclides continued to be aken up through plant roots in small amounts, as ime progressed, and some continued to be leposited on foliage as resuspended dust particles. The inhalation route of entry became less important with passing time, whereas ingestion continued to be the most important route through which radionuclides entered small mammals living n old fallout areas. Long-lived Sr-90 accumulated primarily in bone tissue, while Cs-137 accumulated n muscle and soft tissue. Most of the neutron activation products are short-lived, but among those ound in animal tissues were isotopes of Co, Mn, nd W. Findings indicate that Sr-90 and Cs-137 will ontinue to move in small amounts from abiotic to iotic components in fallout-contaminated areas vith passing time. (See also W74-05181) (Houser-ORNL)
W74-05194

YCLING OF STABLE CESIUM IN A DESERT COSYSTEM,
alifornia Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
. Wallace, E. M. Romney, and R. A. Wood.
n: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-2, 1971, Oak Ridge, Tenn. p 183-186, (1971) 5 tab, 0 ref.

Descriptors: *Cesium, *Cycling, *Ecosystem, Deserts, Ecology, Radioecology, Activation nergy, Assay, Cycles, *Potassium, Soils, Plant athology, Mammals, Potassium radioisotopes, bsorption, Circulation, Movement, Dispersion, Path of pollutants.

Contents of stable Cs in several compartments of esert ecosystems represented at the Nevada Test ite have been determined by neutron activation. otassium in the same compartments has also been determined, and Cs:K discrimination under natural conditions has been evaluated. From compartment sizes some estimates have been made on the rates of Cs cycling through the systems. The rates were low, but the stable Cs was circulating. Compartments studied include soil, several different plant species, arthropods, reptiles, and mammals. The contents of Cs within compartments were in the nanogram per g of dry weight range. There appeared to be a progressive narrowing of the K/Cs ratio going from plants to reptiles and mammals. The addition of stable Cs as CsCl to a soil obtained from the Nevada Test Site resulted in leaf contents in Atriplex canescens of 0.0279, 0.580, 5.15, and 24.0 ppm per g of dry weight for application rates of 0,5, 20, and 50 ppm respectively. The applied Cs was slightly more available than was the original soil Cs. Stable Cs is freely circulated in ecosystems, although at levels lower than that of K by a factor of over 100,000. The stable Cs will have an influence in the cycling of Cs-137. (See also W74-05181) (Houser-ORNL)
W74-05195

ACCUMULATION OF CE-144 BY HICKORY AND CO-60 BY BLACK GUM SEEDLINGS,
Oak Ridge National Lab., Tenn.
W. A. Thomas.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 187-189, (1971) 2 tab, 7 ref.

Descriptors: Trees, *Hickory, *Radioisotopes, Absorption, Cycling nutrients, Foliar, Maple trees, Oak trees, Assay, Radioactivity, Soils, Plant-soil-water relationships, *Cobalt, Seeds, *Cesium.
Identifiers: *Blackgum seedlings, *Rare-earth elements, Seedlings.

Mockernut hickory (Carya tomentosa) trees accumulate the rare-earth elements, and black gums (Nyssa sylvatica) accumulate cobalt, resulting in foliar concentrations several orders of magnitude greater than those of other trees on the same site. To compare absorption rates, seedlings of these species and ones of red maple (Acer rubrum), tulip tree (Liriodendron tulipifera), and white oak (Quercus alba) were grown for 35 days in nutrient solution and in soil, both inoculated with Ce-144 and Co-60. The 'index of selective absorption,' defined here as the amount (dpm) of isotope transported to above-ground plant parts per 100 ml of nutrient solution absorbed by roots, compensates for differences among individuals in the volume absorbed. The Carya index for Ce-144 significantly exceeds ($P < 0.01$) the values for the other species both in soil (Carya 6720 plus or minus 1900; Acer 620 plus or minus 90; Liriodendron 320 plus or minus 50) and insolution (Carya 4590 plus or minus 450; Acer 770 plus or minus 430; Liriodendron 720 plus or minus 350; Nyssa 650 plus or minus 190; Quercus 170 plus or minus 40) in spite of large variation about the means. An insufficient number of Nyssa and Quercus seedlings survived in soil to permit valid statistical analyses. Nyssa and Carya indices for Co-60 in solution both significantly surpass ($P<0.50$) the indices for the other species but do not significantly differ from each other (Nyssa 5110 plus or minus 950; Carya 4470 plus or minus 890; Acer 990 plus or minus 500; Quercus 780 plus or minus 300; Liriodendron 410 plus or minus 130). Comparison of the index between treatments - soil versus solution - shows no significant difference for any species for either isotope. (See also W74-05181) (Houser-ORNL)
W74-05196

TRANSPIRATION MEASUREMENT IN PINES USING TRITIATED WATER AS A TRACER,
Argonne National Lab., Ill.
J. R. Kline, C. F. Jordan, and R. C. Rose.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 190-198, (1971) 4 fig, 16 ref, 2 tab.

Descriptors: *Transpiration, *Evapotranspiration, Measurement, *Moisture uptake, Transfer, *Red pine trees, Tritium, Water, Tracers, Water vapor, Air, Soils, Temperature, Thermal properties, Soil-water-plant relationships.
Identifiers: *Tritiated water.

Tritiated water was used to measure transpiration by red pines (Pinus resinosa) in the field throughout a growing season. The method used is based on previously published theoretical analyses of tracer dynamics in steady-state flowing systems. Transpiration began in the spring only when the soil was completely thawed, even though air temperatures had previously been above freezing for considerable periods of time. Spring transpiration averaged 0.3 cm/day for the forest stand. A maximum value of 0.8 cm/day was found in mid-June at a time when available soil moisture was not rate limiting. In August as soil moisture became depleted, average transpiration rate fell to 0.4 cm/day. Total seasonal consumption of water by the forest from April 1 to October 31, 1970, was 91.4 cm. Rainfall input during the same period was 82.5 cm, indicating only a minor moisture deficit for this growing season. Actually, measured seasonal values agreed well with estimates obtained by solution of Penman's equation and from the evaporation equivalent of net radiation. (See also W74-05181) (Houser-ORNL)
W74-05197

TRITIUM MOVEMENT IN AN OLD-FIELD ECOSYSTEM DETERMINED EXPERIMENTALLY,
Argonne National Lab., Ill.
C. F. Jordan, J. R. Kline, and D. S. Sasscer.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 199-203, (1971) 7 fig, 7 ref.

Descriptors: *Tritium, Movement, *Ecosystems, *Ecological distribution, Vertical migration, *Path of pollutants, Absorption, Roots, Water pollution, Soil contamination, Vegetation, Rain water, Diffusion, Model studies, Hydrologic models, Computer models, Adsorption, Clays, Evapotranspiration.

Tritium movement through an old-field ecosystem was studied in order to better understand how water behaves while inside various ecosystem compartments, and also to validate a mathematical model of tritium movement in ecosystems. Tritiated water was applied to field plots, and was collected at various depths in the soil and from the vegetation at approximately weekly intervals. The experimental results confirmed the following computer predictions: A pulse of tritium will move downward through the soil as a function of the amount of rainwater entering the soil above the pulse. Simultaneous with downward movement, the peak will broaden and flatten due to diffusion. The pulse will become immobilized if the upper soil dries out to the extent that rainwater does not penetrate to the depth of the pulse peak. Concentrations of tritium in vegetation will be equal to concentrations in the soil water at the depth at which the plant is taking up water. Loss of tritium from the system will occur by evapotranspiration and deep drainage. The computer predictions departed from the experimental results because of two phenomena not included in the model: (1) direct transfer of tritium to lower levels of soil via root and worm holes; (2) absorption of tritiated hydroxyl groups onto clay particles. (See also W74-05181) (Houser-ORNL)

INFLUENCE OF WATER REGIME ON THE INDIRECT ABSORPTION OF RADIOCESIUM, RADIOSTRONTIUM, AND RADIOCOBALT BY LOWLAND RICE,
European Atomic Energy Community, Ispra (Italy). Biology Div.
C. Myttenaere, and U. Marckwordt.

In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 212-217, (1971) 1 fig, 6 tab, 17 ref.

Descriptors: *Soil contamination, *Rice, *Cereal crops, *Cesium, *Cobalt, *Strontium, Absorption, Roots, Lysimeters, Data collections, Irrigation, Water pollution, Flood irrigation, Behavior, Ecology, Cation exchange, Oxidation-reduction potential.

Rice soils retain a high percentage of radionuclides transported by irrigation water. The accumulated radioactivity can partly be released to the roots of lowland rice. In order to establish the influence of water regime on the indirect radiocontamination of rice, the availability in soils and the absorption of plants of Cs-134, Sr-85, and Co-60 were studied during three successive years (1967, 1968, 1969), using the same variety in flooded and nonflooded conditions. The experimental conditions of the rice culture in lysimeters were checked with data collected in an irrigated rice field. Radiostrontium and radiocesium absorption by plants was not greatly influenced by the different water regimes. Radiocobalt level of plants was considerably higher in flooded rice and thus reflected the increased availability of Co in flooded soils. Concentration factors varied with the radionuclide and the plant organ. The variations in specific activity of radioisotopes in the plant underline a different behavior of the radioactive and stable isotope in the soil. Under these experimental conditions, only cations, the solubility of which depends directly on the redox state of the soil, were more available and were taken up by the rice plants. (See also W74-05181) (Houser-ORNL)
W74-05199

CALCIUM CYCLING: DIFFUSION INTO A FOREST SOIL,
Oak Ridge National Lab., Tenn.
D. F. Grigal.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 218-224, (1971) 3 fig, 2 tab, 16 ref.

Descriptors: *Calcium, Cycles, *Cycling nutrients, *Forest soils, Hickory trees, Oak trees, Maple trees, Ecosystems, Soil contamination, Water pollution, *Radioactivity, Movement, Soil water, Soil water movement, Diffusion, Vertical migration, Vegetation, Absorption, Transfer, Lysimeters, Cation exchange.

Calcium-45 was introduced into red maple (Acer rubrum L.) trees in spring, and the leaves were harvested in autumn and laid on the floor of an oak-hickory forest. Movement of Ca-45 from the leaves into other components of the ecosystem, and particularly into the soil and soil-water systems, was monitored for two winters and the intervening summer by periodic sampling of soil, litter, and soil-water. After 72 weeks, approximately 50% of the Ca-45 had moved into the soil. Activity of the isotope decreased exponentially with depth and little had moved below 20 cm. Some of the isotope had also cycled through the surrounding vegetation and back to the soil surface. The Ca-45 did not move into the soil in solution but instead moved by surface or exchange diffusion along the soil particles. A grain-boundary diffusion model, which infers rapid diffusion along pores and slow diffusion into soil peds, was used to predict this movement. The Ca-45 initially introduced into the system is accounted for by that observed in the litter and that predicted by the model in the soil. The results imply that studies which emphasize soil solution, as with tension lysimeters, may not provide sufficient information with which to describe movement of naturally incorporated cations from leaf litter into soil. The results further indicate that after introduced fertilizer cations are initially fixed either chemically by the soil or biologically by the macro- and microflora, losses of such cations from the system are likely to be small. Descriptors: *Farm wastes, Path of pollutants, Water pollution sources, *Tile drainage, Nutrients, *Nitrates, *Phosphates, Denitrification, Fertilization, Irrigation practices, *California.
Identifiers: *San Joaquin Valley(Calif., *Composited drainage, *Nutrient variability, In digenous nutrients, Residual nitrogen.

Tile drainage systems of the San Joaquin Valle were monitored for nutrients (nitrogen an phosphorus) to determine the algal growth poter tial (AGP) of the waste, and the degree of trea ment required for removal of AGP. The objective were to determine: (1) the average nutrient cor centrations in tile drainage, (2) the magnitudes c annual, areal and seasonal variability of nutrien and discharges, (3) if a possible correlation exis between nutrients and agricultural practices, an (4) if existing soil conditions influence nutrier concentrations and flows. Average discharges an nutrient concentrations were calculated for di ferent years, months and areas of intere (valleywide, major tiled areas, physiographic pos tions and soils). Average nutrient concentration in the composited drainage from the Valley we found to be 19.3 mg/l for nitrogen (NO3-N) an 0.09 mg/l for phosphorus (PO4-P); averag discharge was 1.4 ac-ft/ac/yr. Nutrient levels in t composited drainage did not change appreciab with time. Variability of nutrients was observe for different seasons; a twofold decrease nutrients was attributed to dilution by irrigatic and denitrification. N was three times more co centrated in drainage from one out of four maj tiled areas investigated. The high N levels were a tributed more to indigenous concentrations in ce tain alluvial fan soils and their parent materia than fertilization. Low N levels found in drainag from basin soils were believed caused by denitri cation. P was seven times higher in the drainag from the southernmost area than the other are investigated. These extraordinarily high leve (0.69 mg/l) were attributed to indigenous conce trations in certain soils made available by anaer bic soil conditions. High discharge in the norther most area (2.3 ac-ft/ac) was believed to be caus by rapid laternal hydraulic conductivity and su rounding irrigation influence. (EPA)

SUBSURFACE BIOLOGICAL ACTIVITY I RELATION TO GROUND WATER POLL TION,
Robert S. Kerr Environmental Research Lal Ada, Okla.
W. J. Dunlap, and J. F. McNabb.
Copy available from GPO Sup Doc EP1.23:660/2-73-014, $0.90; microfiche from NT as PB-227 990 $1.45. Environmental Protecti Agency Technology Series Report EPA-660/2-7 014, September 1973. 60 p, 6 tab, 103 ref. EPA Pr ject 21 AKQ-10.

Descriptors: *Groundwater, *Subsurface vestigations, *Microbiology, *Subsurface wate Habitats, Water pollution, Water pollution effec Path of pollutants, Zone of aeration, Zone of sa

ation, Biological communities, Biodegradation, Temperature, Hydrostatic pressure, Anaerobic bacteria
Identifiers: *Subsurface microbiology, *Subsurface environment, Microbial activity.

Biological activity occurring in subsurface regions below the soil zone may be of considerable importance in determining the fate and effect of pollutants in ground water, but this possibility has received little previous attention. A discussion is presented of subsurface biological activity in regard to ground-water pollution as reflected by available literature references. The subsurface environment is discussed in terms of factors likely to be of greatest significance in regard to the development of biological systems, and previous investigations of subsurface microbial activity are reviewed. Available information indicates the presence in the upper continental crust of the earth of numerous regions, particularly those of sedimentary origin, which are probably suitable habitats for many microbial species. Previous investigations of subsurface microbial activity clearly show the presence of diverse microbial populations in many subsurface regions below the soil zone. Hence, microbial activity appears both possible and probable in most subsurface regions of importance in regard to ground water. Further elucidation of the extent and nature of microbial activity in subsurface regions is needed in developing methods for predicting the impact of pollutants on ground-water quality. (EPA)

REGIONAL ENVIRONMENTAL POLLUTION STUDY: INVENTORY AND ANALYSIS.
Tulsa City-County Health Dept., Okla.
Indian Nations Council of Governments, Tulsa, Oklahoma, June 1972. 59 p, 1 fig, 11 tab, 5 ref. EPA OK 0656 1012.

Descriptors: *Data storage and retrieval, Environmental control, *Computer programs, Pollution abatement, *Urban sociology, Data processing, Planning, Pollutants, Information retrieval, Air environment, Water pollution control, Soil environment, Solid wastes, Waste water(Pollution), Data collections, Urbanization.
Identifiers: *Environmental impact, *Tulsa(Oklahoma), Impact assessment.

The Indian Nations Council of Governments is developing a computerized file containing all pertinent information with respect to environmental protection by providing inventories of all emissions to the ambient atmosphere, all effluents to the Region's streams, all industrial wastewater sources, all potable water sources and treatment plants, and all solid waste collection systems and disposal sites. Summaries are presented of the inventories along with a preliminary analysis of the data. Included is the second phase of the Environmental Data File (Coding Manual) consisting of computer forms, coded structures, instructions for coding, and an example computer retrieval. Some of the data items included in the seven sub-files are: industrial air contaminant emissions, industrial wastewater sources and effluents; industrial solid waste quantities; major sewage treatment facility capacities, discharge volumes and pollutional loads; water treatment plant capacities; solid waste landfill capacities; and proposed development data items. The data are structured for ease of integration into existing files, as well as ease of updating. The file will provide information on pollution problems necessary for making assessments of their environmental impact on various systems. The data can be used for systems models which are being developed for various public improvements. This is a continuing study designed to provide the framework for a complete data system on environmental pollution. The data system will be used for environmental impact assessment, water and sewerage planning, solid waste management, and many other planning functions. (Poertner)

ORGANOMERCURIALS IN THE ENVIRONMENT,
Glasgow Univ. (Scotland). Dept. of Chemistry.
R. J. Cross.
Chemistry and Industry, No 15, p 719-721, Aug 4, 1973. 1 fig, 2 tab, 11 ref.

Descriptors: *Mercury, Pollutants, *Water pollution sources, *Toxicity, Water pollution control, Chemcontrol, Biocontrol, Adsorption, Bacteria, Sediments, Environmental control, Environmental effects, Industrial wastes, Pollution abatement, Aquatic microorganisms, Aquatic bacteria, Bacteria, Benthic flora, Water chemistry, Enzymes, Chemical reactions, Economic feasibility, Dredging, Clams, Aquatic animals, Benthic fauna.
Identifiers: *Mercury compounds, Methyl mercury, Dimethyl mercury, Lewis acids.

The oceans contain about 100 million tons of Hg, many times the total volume mined, used, and dispersed by man, without threatening global poisoning. The isolated cases of pollution-caused Hg poisoning on record, as in chemical laboratories, are caused by locally high concentrations. The main ecological problem is due to Hg in surface waters. Its most dangerous source is the effluent from Cl-alkali factories. Oxidation converts Hg metal into Hg(II) ion which is rapidly adsorbed on bottom sediments, but gradually converted to methyl- and/or dimethyl mercury compounds, mainly by the methylcobalamine coenzyme contained in benthic microorganisms. Of several proposed methods for removal of Hg or the coenzyme from waterways (such as dredging, application of Lewis acids, biological conversion by Pseudomonas bacteria, and cultivation of clams in polluted waters), none seems as practicable or economical as the preventive approach of avoiding the entrance of Hg into waters in the first place. (Brown-IPC)

SLOW RELEASING NITROGEN FERTILIZER FROM THE WASTE PRODUCT, LIGNIN SULPHONATES,
Forschungsanstalt fuer Landwirtschaft, Brunswick (West Germany). Institut fuer Biochemie des Bodens.
W. Flaig.
Chemistry and Industry, No 12, p 553-554, June 16, 1973. 2 fig, 3 ref.

Descriptors: *Fertilizers, *Lignins, *Sulfite liquors, *Pulp wastes, *Nitrogen compounds, Ultimate disposal, Solid wastes, Liquid wastes, *Byproducts, Ammonium compounds, Nitrates, Organic compounds, Solubility, Industrial wastes, Waste disposal, Pulp and paper industry, Soil amendments.
Identifiers: Spent sulfite liquors, 'N-Lignin'.

A soluble fertilizer called N-Lignin was prepared by concentrating spent sulfite pulping liquor to 20% solids content and then heating it at 125 C and 12 atm pressure for 1-2 hr with oxygen and ammonia, followed by evaporation and spray drying. The product contained ca. 5% ammonia-nitrogen, 1% amide-nitrogen, and 6% other organic nitrogen. The N-Lignin was not readily leached from soil, because ca. 45% of the N was bound to high-molecular-weight substances. Good results were obtained in potted plant tests with N-Lignin alone or in 1:1 mixtures with ammonium nitrate. (Buchanan-IPC)

A STARCH-FREE EFFLUENT PROGRAM FOR CORRUGATING PLANTS,
Canada Starch Co. Ltd., Montreal (Quebec).
J. M. L. Currie.
CPPA (Canadian Pulp and Paper Association) Technical Section Proceedings, 1972. p D22-D24.

Descriptors: *Carbohydrates, *Industrial wastes, *Pollution abatement, Water pollution sources, *Pulp wastes, *Adhesives, Equipment, Operation and maintenance, Waste water(Pollution), *Canada, Effluents, Biochemical oxygen demand, Discharge(Water).
Identifiers: Starch, Gluing, Converting industry, Corrugated boards, Corrugated containers, Materials handling, Wash waters.

Starch can reach the sewers of a corrugated board or box factory as a result of faulty equipment, improper operation, and carelessness. The points at which starch is being lost in an adhesive gluing system have been studied at Canada Starch Co. Ltd. and included dry spills, system leaks, overflows, cleanups, and the use of nonstandard-quality batches of corrugating adhesives. Corrective measures by way of equipment modifications and improved handling and operating techniques are discussed. Specific remedies must be adapted to the specific conditions of each factory. No general panacea is possible. (Brown-IPC)

AGRICULTURAL POLLUTION CONTROL AND ENFORCEMENT IN NEW YORK STATE,
Cornell Univ., Ithaca, N.Y.
T. Flaim.
Available from the National Technical Information Service as PB-224 063, $3.00 in paper copy, $1.45 in microfiche. Paper prepared for the Assembly Scientific Staff of the New York Legislature. Nov. 17, 1972. 26 p. 3 tab, 28 ref.

Descriptors: *Pollution abatement, *New York, Agriculture, *Industrial wastes, Food processing industry, *Farm wastes, Dairy industry, *Pesticides, Air pollution, Water pollution sources, Sedimentation, Nutrients, Legislation, *Law enforcement, Research priorities.

A survey of the location, magnitude, and control of agricultural pollution problems in New York State led to the following findings: (1) Agriculture generates over 50% of the total waste volume produced annually in the USA, yet its contribution to pollution is relatively minor. (2) In decreasing order of importance, agricultural pollution sources in New York State come from food processing, animal (farm) wastes, dairy feedlots, sedimentation, plant nutrients, pesticides, and agricultural air pollution. (3) Compared to other industries, agricultural activity is diverse; hence agricultural pollution is difficult to measure, and any legislative control difficult to enforce. (4) Existing technology is adequate for controlling agricultural pollution, except food-processing wastes. Needs for further research are pointed out, and implications of this study for policy-making legislators are indicated. (Brown-IPC)

ATRAZINE, PROPACHLOR, AND DIAZINON RESIDUES ON SMALL AGRICULTURAL WATERSHEDS,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
W. F. Ritter, H. P. Johnson, W. G. Lovely, and M. Molnau.
Environmental Science and Technology, Vol 8, No 1, p 38-42, January 1974. 8 tab, 11 ref.

Descriptors: *Pesticide residues, *Agricultural watersheds, *Pesticide kinetics, *Triazine pesticides, *Phosphothioate pesticides, *Chlorinated hydrocarbon pesticides, Small watersheds, Degradation(Decomposition), Surface runoff, Movement, Water pollution sources, Persistence, Soil analysis, Bottom sediments, Watersheds(Basins), Water analysis, Diazinon, Loess, Soil profiles, Insecticides, Herbicides.
Identifiers: Fate of pollutants, Pesticide loss, Chemical concentration, Atrazine, Propachlor, Electron capture gas chromatography, Sample preparation.

Atrazine (2-chloro-4-ethylamino-6-isopropylamino-s-triazine), propachlor (2-chloro-N-isopropylacetanilide), and diazinon (0,0-diethyl 0-(2-isopropyl-6-methyl-4-pyrimidinyl) phosphorothioate) losses in sediment and surface runoff were measured from four watersheds ranging in size from 1.9-3.8 acres and located in the loessial soil region of western Iowa. Two of the watersheds were planted to ridged corn, and two were planted to surface-contoured corn. Movement of atrazine, propachlor, and diazinon in the soil profile and degradation of these pesticides were measured. Water and sediment samples were obtained from the four watersheds with single-stage sediment samplers. All water and sediment samples were collected in glass bottles, transferred to polyethylene bottles, and frozen immediately after collection. Soil samples were taken within 24 h after pesticide application and at 7-day intervals for the first few weeks. The Geigy Chemical Corp. (1965) ultraviolet method was used for atrazine analysis. Propachlor and diazinon were determined by electron capture gas chromatography. Pesticide losses were much greater from the surface-contoured watersheds than the ridged watershed. Significant amounts of surface-applied atrazine and propachlor were removed from the surface-contoured watersheds by storms occurring shortly after the pesticides were applied. Insignificant amounts of diazinon were removed in the surface runoff and sediment. Generally, pesticide concentrations were higher in the sediment than in the runoff water; however, greater total losses were associated with the greater volume of water. (Holoman-Battelle)

MODEL FOR COLIFORM BACTERIA IN GRAND TRAVERSE BAY,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
R. P. Canale.
Journal Water Pollution Control Federation, Vol 45, No 11, p 2358-2371, November 1973. 16 fig, 8 ref.

Descriptors: *Coliforms, *Mathematical models, *Michigan, *Distribution patterns, Water temperature, Industrial wastes, Sewage, Flow, Water quality, Bays, Water pollution effects, Waste disposal, Equations, Dispersion, Seasonal, Mortality, Boats.
Identifiers: *Grand Traverse Bay(Mich), Boardman River, Survival.

A predictive model for total coliform bacteria in Grand Traverse Bay, Michigan, has been developed using continuity equations with a simple fluid transport model and temperature-dependent first order kinetics. The model has been verified over a wide range of loadings during a period of several years with data obtained during numerous field surveys. The model has been applied to a number of water quality control problems of interest to local planners and others, such as defining the role of storm sewer discharges to the bay, the effects of additional areas for development, and the discharge of wastes from private watercraft. ENERGY AND THE ENVIRONMENT--ELECTRIC POWER.
Council on Environmental Quality, Washington, D.C.
Available from NTIS, Springfield, Va. 22151 - PB-223 326 - Price $3.00 printed copy; $1.45 microfiche. Report, August 1973. 58 p, 13 fig, 18 tab, 1 append.

Descriptors: *Water pollution sources, *Electric powerplants, *Air pollution, *Environment, *Thermal powerplants, Costs, Electric power production.

The use of energy damages the environment not only when it is used but also when it is extracted, processed, transported, and distributed to the consumer. The production and use of energy pollute air, befoul streams, and damage land. And as th use of energy has multiplied, so have the attendar environmental impacts. The conflict betwee energy needs and the environment poses problem that must be solved by understanding th factors that influence demands for energy and b developing energy systems that meet these d mands with minimal damage to the environmen The elements underlying the growing demand f energy and the environmental implications of th complex energy systems for meeting this deman are examined. Focus is on electric energy becaus of the particularly rapid growth in this sector. In proved efficiency of energy systems and energ conservation will reduce environmental damag and slow use of energy resources. Electric energ demand forecasts can be combined with data c the environmental impacts of each electric energ system to yield an estimate of projected enviro mental consequences. (Knapp-USGS)

EFFECT OF TWO IMPOUNDMENTS ON THE SALINITY AND QUANTITY OF STORED WATERS,
Agricultural Research Service, Chickasha, Okla. Southern Great Plains Watershed Research Center.
H. B. Pionke, and O. D. Workman.
Water Resources Bulletin, Vol 10, No 1, p 66-80, February 1974. 6 fig, 2 tab, 7 ref.

Descriptors: *Salinity, *Evaporation, *Reservoirs, *Oklahoma, Water quality, Water pollution sources, Seepage, Saline water, Flood control, Water chemistry, Impoundments.

The effect of hydrologic and chemical processes on salinization of stored waters was determined for two small floodwater-retarding structures located in western Oklahoma. One structure, designed to accommodate a large influx of sediment, was overdesigned (operated at reduced capacity) by upstream diversion of approximately one-half the inflow. Over a 2-year period, the total salinity of stored waters increased approximately 22 times, and the stored water volume decreased to 1/33 its initial volume in the overdesigned (underused) structure, while both volume and salinity of stored waters remained comparatively stable in the other structure. The lack of sufficient dilution by better quality surface runoff and the increased residence time of water in the impoundment apparently caused most of the salinity increase. The bulk of the salt load entering the overdesigned structure, to be concentrated later by evaporation, was associated with base rather than storm inflow. After base inflow ceased, substantial losses of salt load and stored water occurred concurrently. The loss was not adequately explained by chemical precipitation in association with evaporation. Seepage and evaporation appeared to account for much of the hydrologically unexplained loss of stored waters. (Knapp-USGS)

RETENTION BASIN FAILURES IN CARBONATE TERRANES,
Geological Survey of Albama, University. Limestone Hydrology Section.
W. M. Warren.
Water Resources Bulletin, Vol 10, No 1, p 22-31, February 1974. 4 fig, 12 ref.

Descriptors: *Subsidence, *Lagoons, *Water pollution sources, *Sinks, Karst hydrology, Limestones, *Carbonate rocks, Land subsidence, Subsurface drainage, Path of pollutants,
Identifiers: Subsurface erosion, Retention basins.

Sinkholes and subsidence occur in areas subject to dewatering of carbonate formations. Excessive groundwater pumpage is a causative factor in areas of increased sinkhole activity. Subsurface erosion of unconsolidated materials underlain by carbonate rocks is one cause of the collapses. Infiltrating water from retention basins may cause subsurface erosion and eventual failure by collapse of the structure. The resulting groundwater contamination would be great as the pollutants spread throughout the solution-cavity system. (Knapp-USGS)

DRUG RESISTANCE OF COLIFORM BACTERIA IN HOSPITAL AND CITY SEWAGE,
National Inst. for Water Research, Pretoria (South Africa).
W. O. K. Grabow, and O. W. Prozesky.
Antimicrob Agents Chemother, Vol 3, No 2, p 175-180, 1973.
Identifiers: Ampicillin, Bacteria, Chloramphenicol, *Coliform bacteria, *Drug resistance, *Environmental, Escherichia-coli, Infect-drugs, Pollution, *Salmonella-typhi, *Sewage, Streptomycin, Sulfonamide, Tetracycline.

The number and properties of drug-resistant coliform bacteria in hospital and city sewage were compared. There was little difference in the counts of organisms with nontransferable resistance to 1 or more of 13 commonly used drugs. An average of 26% of coliforms in hospital waste water had transferable resistance to at least one of the drugs ampicillin, chloramphenicol, streptomycin, sulfonamide or tetracycline as compared to an average of 4% in city sewage. R+ bacteria in the hospital discharge were also resistant to a broader spectrum of drugs than those in city sewage. In both effluents, the occurrence of fecal Escherichia coli among R+ coliforms was twice as high as among coliforms with nontransferable resistance. Resistance was transferable to Salmonella typhi, and such drug-resistance pathogens in the water environment could be of particular concern. The significance of the results with regard to environmental pollution with R+ bacteria and the dissemination of these organisms is discussed.--Copyright 1973, Biological Abstracts, Inc.

PHYSIOECOLOGY OF THE UMSINDUSI RIVER WITHIN THE PIETERMARITZBURG CITY LIMITS,
Natal Univ., Pietermaritzburg (South Africa). Dept. of Botany.
L. J. Nash, C. H. Bornman, and J. Heeg.
Trans R Soc S Afr, Vol 40, No 3, p 197-208, 1972, Illus.
Identifiers: *Bacteriology, Ecology, *Physioecology, Pollution, Rivers, *South Africa(Umsindusi River), Cities, *Domestic wastes.

A physioecological study of the Umsindusi River at Pietermaritzburg (South Africa) was carried out to estimate the changes in composition taking place during its passage through the city. While little evidence of gross industrial pollution was found, there was a marked enrichment of many constituents, particularly organic substances. A number of sources contribute to the pollution of the Umsindusi, and while this pollution is at present within the self-purification capacity of the river, recovery is slow, and the chemical and bacteriological quality of the water leaving Pietermaritzburg is poor.--Copyright 1973, Biological Abstracts, Inc.

MODELS FOR ENVIRONMENTAL POLLUTION CONTROL.
Michigan Univ., Ann Arbor. School of Public Health.
Ann Arbor Science Publishers, Inc., Ann Arbor, Michigan, 1973. 448 p, 39 fig, 12 tab, 200 equ, 228 ref. R. A. Deininger, Ed. Price: $24.50.

Descriptors: *Systems analysis, *Mathematical models, *Environmental control, *Water pollution control, *Water supply, *Pollution abatement, Solid wastes, Disposal, Air pollution, Optimization, Simulation analysis, Stochastic processes, Digital computers.

The use of mathematical models and systems analysis techniques is considered for the control of environmental pollution and resources development. These methods allow decision makers to screen the various control technologies and procedures and to select those which are most efficient. The book, written by an international group of experts, is organized in six major parts: (1) water pollution control; (2) water supply and water resources development; (3) air pollution control; (4) solid waste disposal; (5) noise control; and (6) total environmental models. Each of these sections contains one or more individual papers. Overall, the book summarizes the present state-of-the-art in mathematical modeling for environmental pollution control. Included are a description of a river basin model and numerous alternate strategies available for improving the river's water quality, a paper dealing with regional sewerage systems, a discussion of ecological aspects of water quality models, the design of water supply systems, a consideration of the economic consequences of constructing weirs and canals, results of air quality modeling studies of cities in Germany, experiences with vehicle routing models in the United Kingdom, the introduction of mathematical modeling and formal optimization techniques to noise pollution, an overall environmental quality model, and an analogy between the safeguard of nuclear materials and environmental pollution control. pollution treatment, *Costs, *Simulation analysis, Information retrieval, Optimization, Resource allocation, Comprehensive planning, River basins, Regional analysis, Effluents, Economic efficiency, Alternative water use, Biochemical oxygen demand, Thermal pollution, Waste water(Pollution), Cooling towers, Flow augmentation, Constraints, Computer programs.
Identifiers: *West Fork White River(Ind.), *External effects, Regional planning, Opportunity costs, By-pass piping, Treatment plants, Nonlinear programming.

The information problem when dealing with external effects of water pollution is immense. Usually the external effect (cost or benefit) is transferred to the affected party through a complex series of physical, chemical or biological processes; an initial effluent discharged by a polluter may affect a downstream user, and in such a case the opportunity costs of a specific resource allocation are not at all clear. This has led to attempts to produce the effects of resource allocation under external effects by modeling the appropriate physical system. Moreover, since different policies are appropriate for different polluters--uniform rules cause significant inefficiencies--a regional approach (thus various treatment strategies) is being considered. Presented is a simulation model of river basin water quality that serves as the constraint set for an optimization model which searches for the efficient solutions given the quality goals. The model explicitly considers water temperature and its relationship to dissolved oxygen; it considers simultaneously several treatment strategies and their costs. The model answers: What is the least cost combination of treatment facilities that will meet given temperature and dissolved oxygen goals. Using such a model, a river basin authority could present an assortment of river use and cost combinations for consideration by the affected parties. (Bell-Cornell)

Descriptors: *Simulation analysis, *Water quality control, *Oxygen, Rivers, Biodegradation, Diffusion, *Computer programs, Advection, Unsteady flow, Downstream, Reach(Streams), Organic matter, Systems analysis, Mathematical models.
Identifiers: *France(River Vienne), *Streeter-Phelps equation, Finite differences, Paper mills.

A mathematical model is described, based on the Streeter-Phelps equation which has been extended to allow for diffusion. A computer program has been established which simulates unsteady flow in rivers. The parameters of the unsteady flow are introduced into the pollution model in which the Streeter-Phelps equation is approximated in a finite difference form and integrated by the so-called 'two steps explicit method.' Discussed is the testing of the model on the French river Vienne in a reach downstream of a large paper mill, in connection with a specialist team of chemists and biologists. Observance showed a significant discrepancy between the rates of biodegradation of organic matter measured in laboratory tests and those obtained by adjustment of the model. Auxiliary phenomena make the problem more complex so that rational determination of the rate of biodegradation of organic matter is hazardous. Thus, presently, it seems best to evaluate 'bulk rates' of biodegradation by adjustment of a model on observed situations in the river. This method necessitates numerous field measurements and requires great care in extrapolating the results of the model. (Bell-Cornell)

WATER QUALITY MODELS AND AQUATIC ECOSYSTEMS STATUS, PROBLEMS AND PERSPECTIVES,
Virginia Inst. of Marine Science, Gloucester Point.
M. E. Bender.
In: Models for Environmental Pollution Control (Ed. by R. A. Deininger), Ann Arbor Science Publishers, Inc., Ann Arbor, Mich., p 137-153 (Chapter 6), 1973. 7 fig, 34 ref.

Descriptors: *Water pollution control, *Aquatic environment, *Mathematical models, *Eutrophication, *Biota, *Water quality, Ecosystems, Systems analysis.

Most biological models are too restricted in scope to be directly useful in evaluating pollutant-related stresses in aquatic environments. They are limited since they usually describe only one problem area (trophic level) within the system, and they often must be ramified, at considerable expense, before being applied to other similar environments. However, in specific types of aquatic environments, those stresses considered natural in nature, i.e., those created by oxygen-consuming wastes, are understood sufficiently to allow for the construction of total ecosystem models. Such models can account for the major functional changes such as respiration and nutrient regeneration as being functions of variables such as time and concentration. Although important, however, nonfunctional changes are less easily modeled; also, at the present time we lack sufficient knowledge to build models describing the effects of pollutants of unnatural origin. Bender considers biotic indices and eutrophication in detail to illustrate the current status of practical water quality models that deal with biotic responses. Although the examples presented can at best be considered as subsystem models, they are representative of the types of models being used to solve water pollution problems. (Bell-Cornell)

ACETYLENE-REDUCTION ASSAY OF ANAEROBIC NITROGEN FIXATION BY SEDIMENTS OF SELECTED WISCONSIN LAKES,
Wisconsin Univ., Madison. Dept. of Soil Science.
A. N. Macgregor, and D. R. Keeney.
Journal of Environmental Quality, Vol 2, No 4, p 438-440, October-December 1973. 4 tab, 18 ref.

Descriptors: *Hardness(Water), *Nitrogen fixation, *Lake sediments, *Assay, Lakes, *Wisconsin, Sampling, Cycling nutrients, Anaerobic conditions.
Identifiers: *Acetylene reduction, Sample preparation, Lake Wingra, Lake Mendota, Tomahawk Lake, Trout Lake, Crystal Lake, Plum Lake, Lake Minocqua, Little John Lake.

Sediment samples were collected by Ekman dredge from 2 hardwater and six softwater lakes in Wisconsin for use in acetylene reduction tests to obtain a first approximation of the amounts of combined N added to lake sediments by anaerobic N fixation. To conduct the assay, sediment was transferred by syringe to 160-ml serum bottles containing 4-mm glass beads. The bottles were sealed with neoprene septa held firmly in place with aluminum seals. With the aid of hypodermic needles, each bottle was simultaneously flushed with a continuous flow of pure He and shaken so as to completely mix the beads and sediment. Ethylene, acetylene, and methane in the atmosphere above the sediment were determined after 1 and 2 days of incubation by gas chromatography. Rate of acetylene reduction indicated that, on the average, sediments from hardwater and softwater lakes may fix 37 and 7.7 ng of N, respectively, per gram (dry weight) per day. The rate of acetylene reduction diminished in the presence of nitrogenase inhibitors. (Little-Battelle)

(Issued by University of Wisconsin Water Resources Center, Madison). OWRR A-020-WIS(2). OWRR A-032-WIS(2). 14-01-0001-1870. 14-31-0001-3050.

Descriptors: Water chemistry, *Plant growth, *Chara, *Fishkill, *Nutrients, *Sunfishes, Oxygen, Alkalinity, Conductivity, Hydrogen, Sulfide, Stratification, Temperature, *Wisconsin, *Thermal pollution, Water pollution effects.
Identifiers: Thermal addition, *Fish growth, Food supply.

Physical, chemical, and biological differences between two similar ponds were studied. One pond was heated to 5C above ambient temperature, while the other served as a reference. Two hundred and fifty green sunfish, Lepomis cyanellus, were planted in each pond. The young-of-the-year grew at a higher rate in the heated pond and permitted Chara to grow year round at an accelerated rate. The heated pond produced more oxygen during the day and lost more oxygen during the night than did the reference pond. The

latter showed greater annual fluctuations of total alkalinity and conductivity. Concentration of hydrogen sulfide in the lower half of the water column, caused by stratification within the reference pond, killed fish in both the summer and winter periods. There was an indication that the synergistic effect of temperature and oxygen with an unlimited food supply will promote fish growth. W74-04861

OCEAN DUMPING IN THE NEW YORK BIGHT: AN ASSESSMENT OF ENVIRONMENTAL STUDIES,
Coastal Engineering Research Center, Fort Belvoir, Va.
G. Pararas-Carayannis.
Available from NTIS, Springfield, Va 22151 AD-766 721 Price $3.00 printed copy; $1.45 microfiche. Technical Memorandum No 39, May 1973. 159 p, 50 fig, 21 tab, 117 ref.

Descriptors: *Water pollution sources, *Water pollution effects, New York, *Municipal wastes, *Continental shelf, Oceans, Environmental effects, Water pollution, *Waste disposal.
Identifiers: *New York Bight.

Short-term studies on effects of ocean dumping in the New York Bight include hydrographic, geological, chemical, biological investigations, and a feasibility study for a remote-controlled electronic sensing system to detect the location and dump status of waste disposal vessels. Circulation patterns were estimated by current meters and by seabed and surface drifters. Chemical analyses were made of the concentration of phosphorus, nitrate, total iron, dissolved oxygen, and chlorophyll-a. Temperature, salinity, turbidity, and pH were measured. Sediment samples were analyzed for organic content and the heavy metals, and biological samples for heavy metals and mercury. Included are studies of benthic meiofauna and macrofauna, zooplankton, finfish and bacteria and disposal of sewage sludge, dredge spoils and acid-iron wastes. Waste disposal results in an increase in the nutrient concentration of the waters of the dumping grounds, and the biochemical oxygen demand of the wastes during summer reduces the dissolved oxygen concentration of bottom waters. The studies defined areas with high carbonaceous content in the sediments, and correlated such carbon-rich deposits with sewage and dredge spoils dumped in the area, and with anomalously high concentration of heavy metals such as silver, chromium, cadmium, copper, lead, nickel, and zinc. The large volume of wastes being dumped in the Bight and frequency of dumping has changed the marine environment of the dumping grounds and adjacent areas. (Knapp-USGS)

ULTIMATE UPPER LETHAL TEMPERATURE OF ATLANTIC SALMON SALMO SALAR L.,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology.
E. T. Garside.
Canadian Journal of Zoology, Vol 51, No 8, p 898-900, August 1973. 1 tab, 8 ref.

Descriptors: *Atlantic salmon, *Lethal limit, *Water temperature, *Bioassay, *Thermal stress, Statistical methods, Freshwater, Mortality, *Canada, Water pollution effects.
Identifiers: *Parr, Acclimatization, Probit analysis, Salmo salar, Data interpretation.

Thermal bioassays were conducted on parr of Atlantic salmon ranging from 70 to 147 mm total length (2.1-29.4 g) collected from a segment of 400 m immediately above high-tide elevation in Bio Brook, Terra Nova National Park, Newfoundland, during early July, 1969. Temperature of the brook varied from 16 to 20C during the 3-day collecting period. Parr were maintained and acclimated in 75-liter glass aquaria containing water drawn from Big Brook. Acclimation was accomplished through the elevation of water temperature 0.5 degrees every 10 h from the temperature of collection with sensitive heater-thermostats until the desired level (27.5C) was achieved. Upper lethal temperature for the highest level of acclimation (27.5C) was calculated from percentage mortality, as a function of test temperature, using probit analysis in the biomedical program (BMDO35) adapted for CDC 6400 computer. The upper lethal temperature for acclimation 27.5C was determined to be 27.80C plus or minus 0.41 for 10,000 min exposure. There was no significant correlation (P much greater than 0.05) between size and order of death. (Holoman-Battelle)

SURVIVAL OF BROOK TROUT IN A BOG-DERIVED ACIDITY GRADIENT,
Pennsylvania State Univ., University Park. Dept. of Biology.
W. A. Dunson, and R. R. Martin.
Ecology, Vol 54, No 6, p 1370-1376, Autumn 1973. 8 fig, 1 tab, 8 ref.

Descriptors: *Brook trout, *Resistance, *Hydrogen ion concentration, *Bioassay, On-site tests, Acid streams, Water analysis, Bogs, Acidity, Electro-fishing, Acidic water, Fishing, Freshwater fish, Water sampling, Chemical analysis, Rainfall, *Pennsylvania.
Identifiers: Survival, *Acidity gradient, *Bear Meadows Bog(Penn), White sucker, Sinking Creek, Carbonic acid, Salvelinus fontinalis, Semotilus atromaculatus, Rhinichthys atratulus, Blacknose dace, Creek chub, Catostomus commersoni, Median tolerance limit.

Bear Meadows Bog water was analyzed to determine (1) if volatile acids were present, (2) the species of fish present at various pH's in the stream, and (3) the pH tolerance of hatchery brook trout placed in the stream at points where native fish were present or absent. The acidity of the bog water (pH 3.7-4.7) is not due to carbonic acid or to any other volatile acid. The approximate pK of the unknown bog water acid(s) is 6.0-6.5. Fish do not occur in Bear Meadows Bog or in Sinking Creek (the bog's only outlet) over a 4.8-km section below the bog where water pH is too low for their survival. The lowest pH in which brook trout and white suckers were caught in Sinking Creek was 4.25 at area 5 (5.25 km below the bog) after a period of unusually heavy rainfall. At a different time brook trout alone were caught at area 4, 5.2 km below the bog, when the pH was 4.75. The lowest recorded pH at this site was 4.0. Survival times of hatchery brook trout placed in boxes in Sinking Creek were directly related to pH. Individual differences in tolerance to low pH were quite marked, especially at pH's not rapidly lethal. Whether these individual differences are of environmental or genetic origin is not known. PRIMARY PRODUCTION OF THE PERIPHYTON IN THE LITTORAL OF THE DANUBE,
Slovenska Akademie Vied, Bratislava (Czechoslovakia). Lab. of Fisheries and Hydrobiology.
M. Ertl, and J. Tomajka.
Hydrobiologia, Vol 42, No 4, p 429-444, September 28, 1973. 4 fig, 2 tab, 36 ref.

Descriptors: *Periphyton, *Primary productivity, Littoral, Rivers, *Biomass, Growth rates, Cultures, *Photosynthesis, Water levels, *Chlorophyll.
Identifiers: *Danube River, Chlorophyll a, Light and dark bottle method.

The gross primary production of periphyton, grown on artificial substrata in the littoral of the Danube, was measured by the light and dark bottle method from April, 1970 to March, 1971. The periphyton used for the measurements was sampled from various depths, in order to cover the production of the whole littoral. The highest primary production was always found in the zone just below the water level. Exceptions occurred only when this zone was inundated for a short time as a result of a temporary rise of the water level and the periphyton was insufficiently developed. In order to compare the values of primary production of periphyton obtained from shallower rivers, where the whole bottom is well illuminated, or from rivers that do not exhibit such frequent and extensive level oscillations as the Danube, average value calculated from results obtained from the zone closest to the water level at the time of measurements, were always used. Primary periphytic production in the surface zone was 43.8 mg 02/sq dm/day. Efficiency of gross photosynthesis in this zone was on the average 1.72 percent. The height of the water level and the water temperature were highly correlated with gross periphytic production. Close relationships between chlorophyll a content, biomass and gross primary production of periphyton were found. (Mortland-Battelle)

TIDAL STREAM DEVELOPMENT AND ITS EFFECT ON THE DISTRIBUTION OF THE AMERICAN OYSTER,
Delaware Univ., Lewes. Coll. of Marine Studies.
R. Keck, D. Maurer, and L. Watling.
Hydrobiologia, Vol 42, No 4, p 369-379, September 28, 1973. 8 fig, 1 tab, 21 ref.

Descriptors: *Oysters, *Tidal streams, *Distribution patterns, *Environmental effects, Meanders, Currents(Water), Scour, Deposition(Sediments), Dredging, Erosion.
Identifiers: American oyster, Crassostrea virginica, Current velocity, Delaware Bay, Macroinvertebrates.

This research was undertaken to determine the effect of tidal stream development on the distribution of the American oyster Crassostrea virginica. Data are presented on the effect of tidal stream formation on larval setting spat development, and maintenance of a healthy adult population. The four major oyster producing rivers in the state of Delaware are: the Leipsic, Murderkill, Mispillion, and Broadkill. In the majority of rivers the oyster producing sections extend 3500-4000 yards (3150-3600 m) from the river mouths. These sections were staked off in 100 yard (90 m) intervals. An oyster dredge with an approximate one meter mouth was towed over the right, middle, and left portions of each 100 yard (90 m) section. All live oysters (larger than 2 cm in height) were counted and measured to the nearest tenth of a centimeter. The total number of oysters per haul was used to plot the density of the oyster beds, and eventually to estimate the total number of bushels for each river. Dense populations are most often found associated with large meanders. The differential current velocities associated with meander formation result in areas of scour, which are beneficial to development of oyster beds; and areas of deposition, which are detrimental to survival of oysters. ULTRASTRUCTURE OF THE GREEN ALGA DICHOTOMOSIPHON TUBEROSUS WITH SPECIAL REFERENCE TO THE OCCURRENCE OF STRIATED TUBULES IN THE CHLOROPLAST,
Illinois Univ., Urbana. Dept. of Botany.
O. Moestrup, and L. R. Hoffman.
Journal of Phycology, Vol 9, No 4, p 430-437, December 1973. 10 fig, 19 ref.

Descriptors: *Aquatic algae, *Chlorophyta, *Cytological studies, Electron microscopy, Plant morphology, Aquatic plants.
Identifiers: *Dichotomosiphon tuberosus, *Ultrastructure, Chloroplasts, Vaucheria, Saprolegnia, Phycomycetes, Cytoplasmic streaming, Sample preparation.

The ultrastructure of the siphonous green alga Dichotomosiphon tuberosus (A. Br.) Ernst is compared with that of other siphonous plants. There is a characteristic association between the Golgi bodies and endoplasmic reticulum, but the mitochondria are not involved in the association as they are in Vaucheria and the phycomycete Saprolegnia. An unusual structure and arrangement of the chloroplasts is described as well as a previously unreported type of 'striated tubule' which occurs in most if not all chloroplasts and amyloplasts. The structure of these tubules is compared with that of other tubules recently found in green algae and higher plants. In addition, cytoplasmic microtubules arranged in the longitudinal direction of the siphon suggest a function in cytoplasmic streaming. (Holoman-Battelle)

THE PRODUCTION OF HYDROGEN PEROXIDE BY BLUE-GREEN ALGAE: A SURVEY,
Texas Univ., Austin. Dept. of Zoology.
S. E. Stevens, Jr., C. O. P. Patterson, and J. Myers.
Journal of Phycology, Vol 9, No 4, p 427-430, December 1973. 1 fig, 2 tab, 7 ref.

Descriptors: *Aquatic algae, *Cyanophyta, *Kinetics, Light, Nostoc, Cultures, Inorganic compounds.
Identifiers: *Hydrogen peroxide, *Axenic cultures, Photochemistry, Biosynthesis, Culture media, Algal physiology, Photoreduction, Photoproduction.

Thirty-eight axenic isolates of blue-green algae (Cyanophyta) were surveyed for hydrogen peroxide production. In order to avoid complications due to poor growth, three different culture media were used. Cells were grown in liquid culture on the chosen medium at 35C, with continuous agitation and 1 percent CO2 in air (v/v) bubbling through the culture. 5-25 w tungsten lamps were positioned 8 cm from the growth tubes in order to enhance peroxide production. Sixteen of the isolates (type I) showed no production of H202 within the sensitivity of the assay. Type II isolates showed no H202 production while in darkness, but at onset of illumination, H202 production was observed. After a short initial induction period, the rate of peroxide production remained steady until assay ingredients were exhausted or until light was extinguished. Type III isolates produced no H202 while in darkness, but at onset of illumination, displayed peroxide production with complex kinetics. Salient features included an initial lag, followed by a burst of period of rapid production of H202; the burst graded into a lower rate which then held steady. Type IV isolates differed markedly from all other assayed in that type IV algae produced H202 in darkness. Illumination of type IV cells caused an immediate increase in rate of H202 production. This increased rate continued without variation until light off. At light off, peroxide production dropped back to a rate equal to or sometimes slightly greater than the initial rate observed prior to illumination. The three kinetic profiles observed for peroxide formation are described. The possible site or sites of hydrogen peroxide formation remain unknown. (Holoman-Battelle)

CHLOROPHYLL, NITROGEN, AND PHOTSYNTHETIC PATTERNS DURING GROWTH AND SENESCENCE OF TWO BLUE-GREEN ALGAE,
Queen's Univ., Kingston (Ontario). Dept. of Biology.
R. J. Daley, and S. R. Brown.
Journal of Phycology, Vol 9, No 4, p 395-401, December 1973. 3 fig, 1 tab, 35 ref.

Descriptors: *Aging(Biological), *Chlorophyll, *Nitrogen, *Photosynthesis, *Plant growth, Plant pigments, *Cyanophyta, Aquatic algae, Instrumentation, Aquatic plants, Nitrates, Growth rates, Cultures, Electron microscopy, Light intensity, Nitrogen fixation.
Identifiers: Anacystis nidulans, Phormidium molle var. tenuior, Growth kinetics, Phycocyanin, Thylakoids, Senescence, Carotenoids, Ultrastructure, Culturing techniques, Organic nitrogen, Oxygen evolution.

A standardized, multiflask, batch culture system was developed to study the processes of algal senescence in Anacystis nidulans and Phormidium molle Gom. var. tenuior W. et G. West. Growth data over a 3-year period gave reproducible and comparable time-course curves. Although A. nidulans in unicellular and P. molle filamentous, the patterns of change with age were similar. Mean logarithmic doubling times and carbon yields were, respectively, 6.9 hr and 390 mg C/liter for A. nidulans and 7.2 hr and 710 mg C/liter for P. molle. Chlorophyll concentration and photosynthetic capacity per unit carbon rose rapidly during the logarithmic phase to maximum levels in either late log phase (P. molle) or early linear phase (A. nidulans), then fell throughout the declining growth phase to low levels in the stationary phase. Nitrate was rapidly exhausted from the medium during the period of logarithmic growth and stoichiometrically converted to particulate organic form; very little subsequent fixation of molecular nitrogen occurred. The phycocyanins were rapidly destoryed during the logarithmic phase while the carotenoids remained relatively constant throughout the whole growth period and then slowly declines. Preliminary electron micrographs showed a progressive deterioration in cellular ultrastructure, especially a reduction in the number of photosynthetic thylakoids, commencing in the linear growth phase. Analysis of the results suggests that occurrence of linear growth kinetics and termination of culture growth were caused by exhaustion of nitrate. The observed decreases in chlorophylls, phycocyanins, and photosynthetic capacity during active culture growth show that senescence effects may not be, as assumed, restricted to the stationary phase of growth. EFFECT OF HELIUM GAS AT ELEVATED PRESSURE ON IRON TRANSPORT AND GROWTH OF ESCHERICHIA COLI,
Naval Medical Research Inst., Bethesda, Md.
N. A. Schlamm, J. E. Perry, and J. R. Wild.
Journal of Bacteriology, Vol 117, No 1, p 170-174, January 1974. 1 fig, 4 tab, 14 ref.

Descriptors: *E. coli, *Helium, *Environmental effects, *High pressure, *Iron, Growth rates, Hydrostatic pressure, *Bacteria.
Identifiers: 2 3-Dihydroxybenzoylserine, Culture media, 2 3-Dihydroxybenzoic acid, Ferric sulfate, EDTA.

Helium at an ambient pressure of 68 atm with 0.2 atm of O2 shortened by 1 to 1.5 h the lag phase for growth of Escherichia coli in minimal medium supplemented with 2 microliters of cell-free culture filtrate (CFF) per ml or with 1 microM 2,3-dihydroxybenzoylserine (DHBS), an iron chelator. The lag phase of cultures not exposed to helium could be shortened by use of supplements, but higher concentrations were required - 10 to 30 microliters of CFF per ml or 10 to 50 microM DHBS. Strain AN 193 of E. coli, which requires the DHBS precursor 2,3-dihydroxybenzoic acid (DHBA), grew well in media with 10 microM DHBA when exposed to helium at 68 atm, whereas 100 microM DHBA was required for growth in unexposed cultures. In the presence of 100 microM DHBA plus 1.0 microM ethylenediaminetetraacetic acid, growth was inhibited at 1 and 68 atm. Growth was restored, however, by the addition of 0.1 microM FeSO4 at 68 atm and 1.0 microM FeSO4 at 1 atm, but lag times were invariably shorter in the pressurized cultures. Hydrostatic pressures of 68 atm did not reduce the lag phase in the presence of CFF, DHBS, or DHBA. Results suggest that 68 atm of helium pressure, but not hydrostatic pressure, elicited a more rapid transport of iron into the cells. (Holoman-Battelle)

BIOLOGICAL RESPONSE TO DETERGENT AND NONDETERGENT PHOSPHORUS IN SEWAGE - PART I,
Utah Water Research Lab., Logan.
D. B. Porcella, P. A. Cowan, and E. J. Middlebrooks.
Water and Sewage Works, Vol 120, No 11, p 50-67, November 1973. 2 fig, 3 tab, 6 ref.

Descriptors: *Algae, *Detergents, *Growth rates, *Limiting factors, *Phosphorus, *Waste treatment, Bioassay, Chemical analysis, Domestic wastes, Nutrients, Water pollution effects, Nitrogen, Iron, Trace elements, Phosphates, Water pollution sources, Water treatment, Water pollution control.
Identifiers: Selenastrum capricornutum, Anabaena flos-aquae.

Sewage effluent from a suburban community of the City of Logan, Utah, was collected during times when detergents were and were not used to ascertain whether the elimination of phosphate detergents would affect algal growth. Algal bioassays were conducted with Selenastrum capricornutum and Anabaena flos-aquae using nutrient spikes to determine which nutrients were limiting. Bioassays were also performed using secondary treated, detergent-free sewage samples spiked with detergent to observe whether any increase in biostimulation resulted. The nutrient spikes were NH4Cl, KH2PO4, Fe and trace elements, and NAAM solution for control. Chemical analysis of the sewage samples showed that restricted use of detergent resulted in a 57 percent decrease in phosphorus content; alum treatment also reduced phosphorus content. However, calculated phosphorus concentrations in the bioassay flasks

for different dilutions of the secondary and tertiary effluents of the two sewage samples indicated the P content was high as a result of the high level of P in the reservoir water used for dilution. It is concluded that if the P content of the water is naturally high, the addition of more P will not affect algal growth. The results of the algal bioassays are not included. (Little-Battelle)

CHARACTERISTICS OF PHOSPHORUS DEFICIENCY IN ANABAENA,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
F. P. Healey.
Journal of Phycology, Vol 9, No 4, p 383-394, December 1973. 10 fig, 3 tab, 74 ref.

Descriptors: *Anabaena, *Deficient elements, *Phosphorus, *Cytological studies, Plant physiology, *Assay, Cyanophyta, Plant growth, Bioindicators, Aquatic algae, Temperature, Hydrogen ion concentration, Light, Phosphates, Absorption, Carbohydrates, Bioassay, Nutrient requirements.
Identifiers: *Enzyme activity, Heterocysts, Alkaline phosphatase, Culture media, Substrate concentration, Chlorophyll a, Anabaena variabilis, Ribonucleic acid, Substrate utilization.

Several aspects of the metabolism and composition of a strain of Anabaena have been studied during phosphorus deficiency. The effects of medium composition, substrate concentration, temperature, pH, and illumination on alkaline phosphatase activity and phosphate uptake have been examined. Of particular interest among these results was the dependence of maximum alkaline phosphatase activity on Ca and of phosphate uptake on Mg. Depletion of dissolved phosphate from the culture medium was accompanied by a marked increase in alkaline phosphatase activity, initial rate of phosphate uptake, and total amount of phosphate taken up to satisfaction of the phosphorus debt. Readdition of phosphate to a phosphorus-deficient culture resulted in a rapid decline in the ability to take up phosphate but no loss of alkaline phosphatase beyond dilution of activity already present. Entry into phosphorus deficiency was accompanied by a loss of heterocysts, a decline in chlorophyll a, protein, RNA, and cellular phosphorus, and an increase in carbohydrate per unit dry weight. The possible use of these changes as physiological indicators of phosphorus limitation in natural situations is discussed. (Holoman-Battelle)

BOTTOM FAUNA OF GOLCUK LAKE. 1. POPULATION STUDY OF CHIRONOMIDS, CHAOBORUS AND OLIGOCHAETA,
Aegean Univ., Bornova (Turkey).
R. Geldiay, and I. U. Tareen.
Scientific Reports of the Faculty of Science No 137, 1972. 15 p, 5 fig, 2 tab, 9 ref.

Descriptors: *Diptera, *Oligochaetes, *Midges, *Benthic fauna, Eutrophication, Sands, Domestic wastes, Spatial distribution, Seasonal, Habitats, Oxygen, Hydrogen sulfide, Temporal distribution, Organic matter, Nematodes.
Identifiers: *Golcuk Lake(Turkey), Chironomus tentans, Chironomus plumosus, Chaoborus crystallinus, Tubifex tubifex, Chironomux anthracinus, Chaetogaster limnaei, Nais, Lumbriculus, Aelosoma, Stylaria fossularis, Enchytraeus, Ophidonais.

The study of bottom fauna, particularly Chironomid larvae, Chaoborus larvae, and Oligochaeta in Golcuk, a eutrophic mountain lake in western Turkey, emphasized their habitat preference for regions rich in organic matter and their depth distribution in different months. The lake, situated 20 km from the town of Odemis, is alkaline with mean pH value 7.3. Samples were taken for qualititative and quantitative analysis at three stations. In Station 2 population and seasonal variation studies were carried out. The sparse occurrence of the organisms was attributed to the sandy bottom. Where urban drainage from the village of Golcuk takes place, the bottom, characterized by organic mud, was the most productive region of the lake. Tubifex tubifex and Chironomus tentans were abundant and functioned as sewage indicators. The organisms are listed. Station 3, being purely sandy, was poorest in density composition. There was a considerable number of bottom fauna in the littoral which contained dense vegetation. Maximum bottom fauna were found in April. In September, during stratification, oxygen depletion and implementation of hydrogen sulfide caused a decline in total bottom fauna, but Oligochaeta and Chironomus tentans were resistant to hydrogen sulfide toxicity. Chaoborus larvae were most abundant in winter. (Jones-Wisconsin)

A BIOASSAY COMPROMISE,
Connecticut Univ., Storrs. Inst. of Water Resources.
J. R. Cain, and F. R. Trainor.
Phycologia, Vol 12, No 3/4, p 227-232, 1973. 1 fig, 4 tab, 8 ref.

Descriptors: *Analytical techniques, *Bioassay, *Algae, Nutrients, Laboratory tests, Monitoring, Connecticut, Growth rates.
Identifiers: *Algal assay, Selenastrum capricornutum, Continuous cultures, Willimantic River(Conn), Natchaug River(Conn), Shetucket River(Conn).

Laboratory procedures are suggested for a quick, reliable, and uncomplicated measurement of the amount of algal growth a body of water can support (its carrying capacity). Selenastrum capricornutum was used as the test organism for assaying nutrient condition of waters. Using an actively growing culture, inoculated, sterile-filtered water was incubated at 22C in continuous fluorescent illumination. Organisms were grown in tubes on a roller tube rotator, and transferred daily, reestablishing a population of 400,000 cells each day. Averages of 5-day runs showed no evidence of nutrient carry-over when 1 + doublings per day were recorded; carryover usually was not apparent on days 3-5 when nutrient poor waters were examined. Samples were collected near the Willimantic, Connecticut sewage treatment plant at the confluence of Willimantic and Natchaug Rivers. Upstream the Willimantic River receives the discharge from several industries. Downstream from the treatment plant, the Shetucket River was also sampled. This study shows that growth rate of a defined population in a daily transferred culture may be used to measure the ability of surface waters to support algal growth. The procedure suggested meets the basic requirements of simplicity, speed, reproducibility, and applicability to field conditions. (Jones-Wisconsin)

FACTORS AFFECTING THE PHOTOSYNTHETIC CAPACITY OF LABORATORY CULTURES OF THE DIATOM PHAEODACTYLUM TRICORNUTUM,
La Trobe Univ., Bundoora(Australia). Dept. of Botany.
D. J. Griffiths.
Marine Biology, Vol 21, No 2, p 91-97, 1973. 4 fig, 1 tab, 3 ref.

Descriptors: *Photosynthesis, *Biochemistry, *Diatoms, Laboratory tests, Temperature, Chlorophyll, Enzymes, Light intensity, Plant growth.
Identifiers: Phaeodactylum tricornutum.

The relative importance of the two photosynthetic components, enzymatic reactions and light reactions, in controlling the photosynthetic capacity of laboratory cultures of Phaeodactylum tricornutum exposed to a variety of conditions is investigated, and, in a preliminary way, the possible mechanisms involved are explored. The light-saturated photosynthetic capacity of batch cultures of P. tri-cornutum grown in a regime of 16 h light and 8 h dark, reaches a maximum two days before the end of the exponential growth phase and declines thereafter. The fall-off of photosynthetic capacity is more rapid at a higher light intensity. Cultures exposed to a prolonged period of darkness maintain a high photosynthetic capacity. It is possible to reversibly reduce the photosynthetic capacity to a very low level, without significantly affecting the chlorophyll-a concentration by carefully controlling the conditions of dark incubation. Evidence from estimations of chlorophyll-a, total protein, and of the gross pattern of photosynthetic assimilation under different gread of Alberni Inlet and the influence of oceanic, species rich water drawn in through the inlet mouth by way of a subsurface counter current is postulated. (Jones-Wisconsin)

AN EXPERIMENTAL INVESTIGATION INTO EFFECTS OF PULP MILL EFFLUENT ON STRUCTURE OF BIOLOGICAL COMMUNITIES IN ALBERNI INLET, BRITISH COLUMBIA. PART 1: SUBTIDAL COMMUNITIES,
British Columbia Univ., Vancouver. Dept. of Zoology.
J. R. E. Harger, M. L. Campbell, R. Ellison, W. P. Lock, and W. Zwarych.
International Journal of Environmental Studies, Vol 4, No 4, p 269-282, 1973. 24 fig, 1 tab, 35 ref.

Descriptors: *Pulp wastes, *Estuaries, *Biological communities, Canada, Phytoplankton, Intertidal areas, Water pollution effects, Oxygen, Light intensity, Salmon, Light penetration.
Identifiers: *Alberni Inlet(British Columbia), Species diversity.

During the summer of 1971 an investigation into effects on biological communities of effluents discharged from a Kraft paper mill into Alberni Inlet on the west coast of Vancouver Island, British Columbia, was undertaken. The problem of separating effects of fresh water influence on developing communities from those attributable to pulp mill effluent was solved partly by setting a series of roughened formica test panels at a depth of 20 ft throughout the length of the inlet in order that settlement of sessile organisms could be recorded. These plates were also extended into a control area. Structure of communities developing on test panels was investigated using four analytical techniques. This structure indicated simplification, as measured by a number of indices relating to species diversity, and was associated with water transparency as well as other physical factors relating to effluent discharge. A dynamic interaction between influence of dark colored mill effluent in reducing phytoplanktonic production at the head of Alberni Inlet and the influence of oceanic, species rich water drawn in through the inlet mouth by way of a sub-surface counter current is postulated. (Jones-Wisconsin)

PRODUCTION OF A NATURAL POPULATION OF BITHYNIA TENTACULATA L. (GASTROPODA, MOLLUSCA),
Syracuse Univ., N.Y. Dept. of Zoology.
J. S. Mattice.
Ekologia Polska, Vol 20, No 39, p 525-539, 1972. 3 fig, 4 tab, 19 ref.

Descriptors: *Productivity, *Aquatic populations, *Snails, *Biomass, Life cycles, New York, Freshwater, Mortality, Standing crops.
Identifiers: *Bithynia tentaculata, Oneida Lake(N.Y.).

Productivity of a natural population of Bithynia tentaculata, a prosobranch gastropod mollusk, in eutrophic Oneida Lake, New York was estimated from standing crop biomass and mortality. It is a relatively recent immigrant to North America and is replacing the Pleurocerid in this climate. Biomass was estimated using two basic units: tissue dry weight and total organic carbon. Regular growth samples revealed that Bithynia lives for 17 to 18 months and shows a typical growth curve for a freshwater snail in a harsh temperate environment. Field density counts were combined with analyses of total organic carbon of snails at selected times of the year to yield assessments of population biomass. Mortality data, obtained from comparative density measurements and collections of empty shells made possible the estimate of carbon lost from the population over a 12 month period. The sum of the difference between the standing crop biomass in June of two consecutive years and the carbon lost to mortality in the interim gave a value for productivity of the population of 511 mg/C/sq m/year. (Jones-Wisconsin)

SPATIAL DIFFERENTIATION AND CHANGES IN TIME OF ZOOMICROBENTHOS IN THREE MASURIAN LAKES,
Warsaw Univ. (Poland). Zoological Inst.
K. Prejs, and A. Stanczykowska.
Ekologia Polska, Vol 20, No 45, p 733-745, 1972. 7 fig, 3 tab, 12 ref.

Descriptors: *Benthic fauna, *Lakes, *Spatial distribution, Temporal distribution, Microorganisms, Nematodes, Oligochaetes, Copepods, Crustaceans, Diptera, Dominant organisms, Littoral, Profundal zone.
Identifiers: *Mikolajskie Lake(Poland), Sniardwy Lake(Poland), Taltowisko Lake(Poland), Ostracoda, Tardigrada.

In a 6-year study of zoomicrobenthos of three Polish Masurian lakes, differences were recorded in samples between stations at the same depth, composition, and numerical dynamics in number and qualitative composition. Lake Mikolajskie is eutrophic, holomictic; Lake Sniardwy, eutrophic, polymictic; and Lake Taltowisko, mezotrophic, holomictic. The zoomicrobenthos groups distinguished were Nematoda, Oligochaeta, Copepoda, Cladocera, Ostracoda, Chironomidae, and Tardigrada. Differences in numbers were not great and were independent of density and qualitative composition. From littoral to profundal, the highest number was in the littoral, lowest in the sublittoral; a similar distribution of systematic groups in all profiles, constant domination of Nematoda in shallow parts and a decrease in their number with increasing depth, were found. Determination of changes in zoomicrobenthos number and composition during the 6 years at the same stations in the profundal zone showed that the polymictic Lake Sniardwy has a relatively constant number but domination of particular animal groups varies. Holomictic Mikolajskie Lake displays changes in number with a growth tendency in the last years but with a relatively constant domination of one group. (Jones-Wisconsin)

SPATIAL DIFFERENTIATION ABUNDANCE OF BACTERIA IN THE WATER OF MIKOLAJSKIE LAKE,
Polish Academy of Sciences, Warsaw. Inst. of Ecology.
W. A. Godlewska-Lipowa, and I. Jablonska.
Ekologia Polska, Vol 20, No 28, p 367-371, 1972. 2 fig, 2 tab, 3 ref.

Descriptors: *Bacteria, *Lakes, *Spatial distribution, Sewage effluents, Microbiology.
Identifiers: *Mikolajskie Lake(Poland).

Water samples were taken in 12 places along the main axis of Mikolajskie Lake, Poland some distance from shore in the vicinity of municipal sewage flow and at the connection with lakes Sniardwy and Beldany. Samples were taken from surface to bottom every 2-5 m at each site. Filtered samples were analyzed to calculate total number of dominant bacteria, that is, cocciforms, rodforms bacilla. The differences found between particular samples, and even particular filters, were relatively small. Bacteria numbers ranged within 4900-7900 thousands/ml of water on the lake surface and 4000-10,000 thousands/ml at other depths at the various stations. Greater abundance of bacteria was observed close to the municipal sewage inflows and at the connection with lakes Sniardwy and Beldany. Great bacterial abundance was found at the depths of 5 and 10 m, on a site possibly near sewage inflow. A considerable preponderance of cocci forms over the bacilliforms and rod-forms indicated that the organic substance flowing into the lake is easily assimilated and becomes quickly mineralized. There was a small percentage of positive Gram bacteria of bacilliform, ranging from 1-3% to 14%. (Jones-Wisconsin)

ASCORBIC ACID AND HETEROCYST DEVELOPMENT IN THE BLUE-GREEN ALGA ANABAENA AMBIGUA,
Banaras Hindu Univ., Varanasi (India). Lab. of Algal Physiology.
C. K. Wahal, N. C. Bhattacharya, and F. R. S. Talpasayi.
Physiologia Plantarum, Vol 28, No 3, p 424-429, 1973. 6 fig, 21 ref.

Descriptors: *Cytological studies, *Anabaena, *Organic acids, Nitrogen, Enzymes, Metabolism.
Identifiers: *Ascorbic acid, *Heterocyst production, Anabaena ambigua.

The role of ascorbic acid in heterocyst development is examined in a strain of Anabaena ambigua. It was cultivated with combined nitrogen and with molecular nitrogen. The amount of different forms of ascorbic acid found in the alga grown with and without combined nitrogen is given. The L-ascorbic acid content of the alga containing heterocysts was always higher than that present in the alga lacking the heterocysts, whether the alga was exposed to light or kept in darkness. The ratio of heterocysts to vegetative cells increased considerably under the influence of ascorbic acid. Thus it appeared that the effect of iso-L-ascorbic acid was about the same as that of L-ascorbic acid. Exogenously added ascorbic acid, up to 0.5 mg/ml, increased the heterocyst frequency to nearly three times that of the control. D-isoascorbic acid, an analogue of ascorbic acid, also showed an enhancement of heterocyst production. The exact location of the enzyme in the alga is not known although the heterocysts were earlier shown to contain ascorbic acid. Cytochemical tests, however, indicated strong peroxidase activity in the heterocysts. (Jones-Wisconsin)

SYNCHRONOUS CULTURES OF CHLAMYDOMONAS REINHARDTI: PROPERTIES AND REGULATION OF REPRESSIBLE PHOSPHATASES,
Bergen Univ., Norway. Botanical Laboratory.
T. Lien, and G. Knutsen.
Physiologia Plantarum, Vol 28, No 2, p 291-298, 1973. 11 fig, 20 ref.

Descriptors: *Cytological studies, *Chlamydomonas, *Enzymes, Phosphates, Phosphorus, Proteins, Synthesis.
Identifiers: *Repressible phosphatases, Derepression.

In synchronously growing Chlamydomonas cells, phosphatase activities in -P and +P medium, de novo synthesis (derepression) of phosphatase in cells grown in -P medium, variation in TCA soluble inorganic and organic phosphate during phosphatase derepression, and effect of orthophosphate and cycloheximide on derepression of phosphatase are reported. A double labelling isotope technique coupled with cellulose acetate electrophoresis were used. Repressed and derepressed phosphatase exhibited different enzymatic properties. Especially the acid phosphatase was located near the cell surface. Inorganic, cold TCA-extractable P-32, decreased during the first 1-2 h after phosphate deprivation when there was little or no net synthesis of phosphatase. Results of experiments with additions of orthophosphate and cycloheximide to derepressed cells, indicated that the derepressible enzyme was relatively unstable, while its m-RNA was relatively stable. Of ecological significance is the attachment of the enzyme to the cell surface, and the excretion of enzyme during sporulation. This may enable cells in growth media with low orthophosphate contents to hydrolyze extracellular phosphate esters and consequently increase the amount of available orthophosphate. This mechanism is made more efficient by the increased substrate affinity of the derepressed enzyme. (Jones-Wisconsin)

BIOMASS MONITORING OF ALGAL CULTURES BY FLUORIMETRIC MEASUREMENT OF THEIR CHLOROPHYLL CONTENT,
Swedish Water and Air Pollution Research Lab., Stockholm.
T. Larsson.
In: Proceedings from A Nordic Symposium, October 25-26, 1972, Oslo, Norway, p 59-61.

Descriptors: *Analytical techniques, *Algae, *Fluorometry, *Bioassay, Biomass, Monitoring, Cultures, Chlorophyll, Nutrients, Trace elements, Phosphates, Chelation.

The effects of trace elements, a chelating agent, and phosphate on algal growth were studied in two factorial experiments. Scenedesmus quadricauda and Raphidonema spiculiforme were cultivated in media, whose concentrations of the above substances were varied simultaneously. Growth was measured by fluorimetric determinations of in vivo chlorophyll and sometimes also by microscopic cell count. Highly significant correlations were found between these two methods of biomass monitoring. Results of the experiments show that fluorimetric measurement of in vivo chlorophyll is a useful method for assessing growth in algal experiments. From the analysis of variance, and due to problems of using chlorophyll concentration to assess biomass, fluorimetric measurements of algal growth should be controlled by a method which measures biomass more accurately, for instance by analysis of cell carbon or cell counting with an electronic particle counter. It is thus important to measure biomass with one of these methods at a time when the analytical results will give much information concerning the objectives of the experiment. Such a time can be chosen with the guidance of fluorimetric determination of in vivo chlorophyll. (Jones-Wisconsin)

FIELD EXPERIMENT ON THE FACTORS CONTROLLING PRIMARY PRODUCTION OF THE LAKE PLANKTON AND PERIPHYTON,
Polish Academy of Sciences, Warsaw. Inst. of Ecology; and Polish Academy of Sciences, Warsaw. Dept. of Hydrobiology.
A. Hillbricht-Ilkowska, A. Kowalczewski, and I. Spodniewska.
Ekologia Polska, Vol 20, No 25, p 315-326, 1972. 7 fig, 1 tab, 10 ref.

Descriptors: *Primary productivity, *Lakes, *Plankton, Periphyton, Photosynthesis, Algae,

Spatial distribution, Light penetration, Eutrophication, Chlorophyll, Diatoms.
Identifiers: Mikolajskie Lake(Poland), Phaeophytin.

Two experiments with plankton and one with periphyton in Mikolajskie Lake of the Masurian Lakeland were conducted to distinguish the influence of light on algae production at various depths. Plankton was sampled at 8 different depths; periphyton from Potamogeton perfoliatus leaves at 5 depths. Primary productivity was estimated by the light-dark bottle technique. Oxygen, chlorophyll, and phaeophytin were determined; total biomass and dominant species estimated. Diatoms were dominant in plankton and many small forms were found during the spring experiment. Algal biomass was then about 5.0 mg/l, and vertical distribution of algae from 0 to 15 m of depth was relatively uniform. Dominance of dinoflagellates was observed during the summer experiment with plankton. Visible concentrations of dinoflagellates capable of active movements were found in the layers 1-2 m and 6-8 m. In both plankton experiments there were no basic differences in species composition of algae at particular depths. Plankton collected from all depths during the spring experiment, including the samples from 10 and 15 m, showed similar production values at all suspension depths. Results suggest varying photosynthetic algal activities from different depths. Highest photosynthetic activity in the summer plankton was found at depths of 3 and 5 m. (Jones-Wisconsin)

PROBLEMS OF THE CONSERVATION OF FRESHWATER ECOSYSTEMS,
Nature Conservancy, Edinburgh (Scotland).
N. C. Morgan.
In: 'Conservation and Productivity of Natural Waters,' Symposia of the Zoological Society of London, No. 29, p 135-154. Academic Press, London, 1972.

Descriptors: *Water conservation, *Preservation, *Natural resources, Management, Europe, Wetlands, Protection, Reservoirs, Water policy, Aquatic life, Estuaries, Wildlife, Recreation, Water pollution effects, Agriculture, Forestry, Insecticides, Herbicides, Farm wastes, Aesthetics, Aquatic plants, Systematics.
Identifiers: *Nature Conservancy(Scotland), United Kingdom, Chalk aquifers.

The discussion centers on the major problems in the United Kingdom and some of the steps taken by the Nature Conservancy and other organizations in conserving freshwaters with the intention of maintaining their scientific interest or rehabilitating their physical, chemical, or biological quality. With the objective to select a series of high quality sites as National Nature Reserves to represent the range of variation of this habitat, reference is made to the problems of water abstraction and storage reservoirs with their varying water levels resulting from specific usage. The effects of irrigation and abstraction of water from chalk aquifers and their effects on river flow, and increasing pressures to use open water for recreation and the consequent effects on conservation of habitat and wildlife particularly near large cities are discussed as well as domestic pollution and the effects of various agricultural practices, particularly in relation to nutrient levels in drainage water. The decline of aquatic vegetation in some water bodies is recorded and possible causes mentioned. The extensive use of herbicides for clearing drainage ditches and the side effects on other components of the ecosystem are considered. (Auen-Wisconsin)
W74-05057

BIOENERGETICS OF THE ASSIMILATING CELLS OF CHLORELLA PYRENOIDOSA CHICK. II. RELATION OF CYCLIC AND NON-CYCLIC PHOTOPHOSPHORYLATION TO PHOTOSYNTHETIC CO2 FIXATION,
Akademiya Nauk SSSR, Leningrad. Botanicheskii Institut.
T. A. Glagoleva, M. V. Chulanovskaya, and O. V. Zalenskii.
Photosynthetica, Vol 6, No 4, p 354-363, 1972. 3 fig, 2 tab, 34 ref.

Descriptors: *Chlorella, *Biochemistry, *Photosynthesis, Cycles, Cytological studies, Light, Carbon cycle.
Identifiers: *Photophosphorylation, Calvin cycle.

Regular changes of relative rates of cyclic and non-cyclic photophosphorylation were investigated and compared with rates of photosynthetic carbon dioxide fixation and oxygen evolution under varying irradiance and temperature. Rate of photoassimilation of glucose was determined by counting the radioactivity of Chlorella pyrenoidosa cells starved of carbohydrates. Rate of starch biosynthesis was estimated by C-14 incorporation. At 670 nm rate of carbon dioxide fixation was 3 times greater at 38C than at 10C and the incorporation of C-14 into starch 2.8 times. Incorporation of C-14 into starch at 714 nm depends on temperature only between 10-20C. From these tests, the relative contribution of cyclic photophosphorylation in the processes immediately unrelated to the Calvin cycle can be estimated. These data testify that interrelations of energy sources in uptake of substances and ions and in the biosynthesis of macromolecules (polysaccharides and proteins) vary under different experimental conditions. Upon increase in rate of photosynthetic gas exchange, relative contribution of non-cyclic photophosphorylation to the realization of these processes also increases and under a certain set of conditions can amount to half of the 'summary' rate of photophosphorylation. (Jones-Wisconsin)

AERATION SYSTEM REVITALIZES LAKES.
Civil Engineering, American Society of Civil Engineers, May 1971. p 107. 1 fig.

Descriptors: *Aeration, *Lakes, *Rehabilitation, Oxygenation, Destratification, Ohio, Illinois, Michigan, Algal control, Freezing, Waste water treatment, Technology.
Identifiers: *Air Aqua systems.

If enough wastes are dumped into a lake, there comes a point when oxygen consumption of wastes and decaying algae is greater than oxygen introduced from air and by living algae. Then even natural exchanges of water strata cannot provide adequate oxygen. During the past decade, several decaying lakes in the Midwest have been restored to healthy conditions through use of the 'Air-Aqua' aeration system which introduces air to the lake bottom. This system overcomes eutrophication by artificially inducing vertical circulation of lake water and thus increasing the oxygen content of the bottom water layer. The small size of the bubbles is the key to the system as tiny bubbles dissolve oxygen more quickly into the bottom water than would those of large diameter. Not only does a large turnover of water occur in a short time, but no turbulence is created thus no sediment is brought to the surface. Three applications of the system in Ohio, Illinois, and Michigan are given, illustrating its ability to restore decaying lakes to balanced ecosystems in which fish and water fowl can thrive. (Jones-Wisconsin)

NUTRIENT STUDIES IN HYPERFERTILIZED ESTUARINE ECOSYSTEMS. I. PHOSPHORUS STUDIES,
Gulf Coast Research Lab., Ocean Springs, Miss.
W. Abbott.
Advances in Water Pollution Research, Vol 4, No II-3240, p 729-739, 1970. 2 fig, 5 tab, 27 ref. FWPCA Grant WP-01030-01.

Descriptors: *Eutrophication, *Phosphorus, *Cycling nutrients, Phosphorus compounds, Nitrates, Productivity, Photosynthesis, Respiration, Ecosystems, Chlorophyll, On-site laboratories.
Identifiers: *Orthophosphate, Total phosphate.

It was established on a pseudokinetic, long-term basis that some experimental systems assimilated exogenous dissolved orthophosphate according to a first-order, presumptively sorption-limited, reaction scheme. Further, photosynthetic production and community respiration were correlated with nitrate and phosphate fertilization. Relevant field studies are reported. Three forms of phosphorus were defined: dissolved, labile, and bound. Analyses were carried out for orthophosphate or total phosphate on each phosphorus fraction. Of nitrogen forms, only nitrate was monitored. Eighteen experimental ponds were constructed by capturing a small bayou channel and fertilized. Trends evident by passage of P-32 through the pond environment suggest a steady-state ecological phosphorus processing machine. Differences between fertilized and control ponds indicate that a demand system probably controls allocations to various ecosystem sub-units. From this standpoint, at least relative to phosphorus, an estuary is not a 'nutrient trap' but is, rather, a 'nutrient buffer' tending to modulate phosphorus flow through the ecosystem while obviating wild fluctuations in the phosphorus economy. Sediments, in this context, are the phosphorus stockpile. Periodically, turbulence effects cycle part of this stored reserve. Metabolic demands within the community may withdraw any required phosphorus from the flux and the excess is soon returned to the stockpile. (Jones-Wisconsin)

TROPHIC RELATIONS OF AQUATIC INSECTS,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
K. W. Cummins.
Annual Review of Entomology, Vol 18, p 183-206, 1973. 6 fig, 3 tab, 72 ref.

Descriptors: *Animal behavior, *Trophic level, *Aquatic insects, *Food habits, Nutrients, Respiration, Food chains, Energy budget, Cycling nutrients, Systematics, Freshwater, Digestion, Diptera.
Identifiers: Hemiptera, Tanypodinae, Orthocladinae, Diamesinae.

Successful rehabilitative or management strategy of freshwater ecosystems must rely on knowledge of their structure and function. A basic facet is material cycling and energy flow. Significant portion of such cycling and flow involves processing of various forms of organic matter by freshwater invertebrate animals, especially insects, substantiating the interest in aquatic insect trophic relations-food intake, tissue assimilation, and waste release. Nutritional requirements of aquatic insects may be broadly classed as two somewhat distinct problems: intake of adequate calories to meet immediate energy costs and to accumulate energy stores; and sufficient procurement of protein to sustain adequate growth. Differences within a single species are reported. Discrepancies in food habits of the net-spinning caddis larva, Hydropsyche betteni, are described. In addition to trophic differences between two populations of the same species from different locations, age-specific variations within the same population are indicated. In general, Tanypodinae are predaceous, Orthocladinae are detrital-algal feeders, Diamesinae are algal feeders, and Chironomidae are algal-detrital feeders with some leaf mining and predaceous species. The contention is supported that most aquatic insects are best termed polyphagous or generalists and that availability, usually delineated by food particle size and texture, is the key to trophic relationships among aquatic insects. PHOTOSYNTHETIC RATES IN RELATION TO NITROGEN RECYCLING AS AN ADAPTATION TO NUTRIENT DEFICIENCY IN PEAT BOG PLANTS,
Department of Agriculture, Ottawa (Ontario). Plant Research Inst.
E. Small.
Canadian Journal of Botany, Vol 50, No 11, p 2227-2233, 1972. 2 fig, 2 tab, 5 ref.

Descriptors: *Cycling nutrients, *Nitrogen, *Bogs, *Plants, Deficient elements, Peat, Absorption, Phosphorus, Potassium, Leaves, Photosynthesis.
Identifiers: Ottawa(Canada), Evergreen plants, Deciduous plants.

Bog evergreens may primarily represent a mechanism to retain and use nutrients. Perennial leaf duration, high reabsorption of nutrients before leaf fall, and high rates of photosynthesis contribute to maximum use of an acquired unit of nutrient element. Efficiency of the interaction of these three factors in evergreens as contrasted with deciduous species, and in bog species as compared with species of other habitats, is examined. Fifteen species in a raised sphagnum peat bog were compared with 13 non-bog species with respect to light-saturated net photosynthetic rate, and content of N, P, and K within foliage and leaf litter. Bog species reabsorb a greater proportion of the nitrogen from their leaves preceding leaf fall, than do non-bog deciduous species. When bog deciduous species are compared with non-bog deciduous species, they are potentially capable of manufacturing an average of about 60% more photosynthate for an acquired unit of nitrogen. Bog evergreens can potentially manufacture an average of about 235% more photosynthate per acquired unit of nitrogen than can bog deciduous species. (Jones-Wisconsin)

LIMNOLOGICAL SURVEY OF LAKES MICHIGAN, SUPERIOR, HURON AND ERIE,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske, and J. C. Roth.
Publication No. 17, 1973. 108 p, 15 fig, 35 tab, 143 ref, 1 append.

Descriptors: *Limnology, *Great Lakes, *Biological communities, *Biological properties, *Physicochemical properties, Lake Michigan, Lake Superior, Lake Huron, Lake Erie, Analytical techniques, Water temperature, Light penetration, Dissolved oxygen, Alkalinity, Ions, Nutrients, Chlorophyll, Photosynthesis, Phytoplankton, Benthos, Zooplankton, Systematics, Bottom sediments.

Extensive physical, chemical, and biological information was gathered with uniform methods from 87 stations in Lakes Michigan, Superior, Huron and Erie in the summer of 1970. Data include temperature, transparency, dissolved gasses pH, alkalinity, major ions, nutrients, chlorophyll, carbon fixation by phytoplankton, zooplankton, and benthos. On the basis of limnological characteristics, the lakes are divided into ten distinct geographical zones and data on some of the parameters are compared for the ten zones. Temperature regimes vary greatly due to latitude, depth, and sampling time. In the central basin of Lake Erie, the mean surface temperature was compared with the mean concentration of dissolved oxygen. Calcium and alkalinity values are largely controlled by mineralogical characteristics of the drainage basins, whereas inputs of sulfate and chloride are largely urbanization and industrialization products. Absolute levels of silica and nitrate nitrogen in Lake Huron are controlled largely by nutrient concentrations in inputs from Lakes Michigan and Superior. Depletion of silica and nitrate in the epilimnion increases with increasing eutrophication. The lakes ranking in order of most oligotrophic to most eutrophic are Superior, Huron, Michigan, and Erie, with Saginaw Bay being as eutrophic as parts of Lake Erie. (Jones-Wisconsin)

HYDROBIOLOGICAL STUDIES 2.
Ceskoslovenska Akademie Ved, Prague.
Academia Publishing House of the Czechoslovak Academy of Sciences, Prague. 1973. 348 p, 154 fig, 62 tab, 322 ref.

Descriptors: *Hydrobiology, *Limnology, *Hydrology, *Chemical properties, *Physical properties, *Biological communities, Primary productivity, Plankton, Benthos, Model studies, Stratification, Hydrodynamics.
Identifiers: *Vltava Cascade(Czechoslovakia), Slapy Reservoir(Czechoslovakia), Orlik Reservoir(Czechoslovakia), Vrane Reservoir(Czechoslovakia), Stechovice Reservoir(Czechoslovakia), Sazava River(Czechoslovakia).

Results of 10-year systematic observations of the limnology of riverine Slapy Reservoir and the Vltava Cascade consisting of a chain of three main reservoirs and four re-regulation reservoirs in Czechoslovakia are discussed. Critical periods enabling determination of underlying cause and effect relationships were revealed and the complex reservoir hydrodynamics are evaluated. An empirical thermal model for an isolated reservoir and a reservoir in the cascade is calculated. The changes that occurred in the Slapy Reservoir after filling of the new Orlik Reservoir, located above Slapy on the Vltava River, are indicated. Also discussed are the phytoplankton species and their activity and how benthic observations on Slapy Reservoir showed wide differences in organic matter supply and the cessation of this supply after upstream Orlik Reservoir became operative. Fish feeding activity in the littoral, sublittoral and the profundal zones was studied. Investigation results are reported of two re-regulation reservoirs with short retention times and differing inflowing waters. Primary production in relation to discharges and stratification, and quantitative relation of phyto- and zooplankton are indicated and whether the chemical or bacteriological composition of water is changed after passage through a reservoir with short retention time, and if some features characteristic of static waters develop. (See W74-05069 thru W74-05074) (Jones-Wisconsin)
W74-05068

EFFECT OF AN UPSTREAM RESERVOIR ON THE STRATIFICATION CONDITIONS IN SLAPY RESERVOIR,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
M. Straskraba, J. Hrbacek, and P. Javornicky.
In: 'Hydrobiological Studies 2,' Academia Publishing House, Prague. 1973. p 7-82. 36 fig, 5 tab, 81 ref.

Descriptors: *Reservoirs, *Thermal stratification, Dissolved oxygen, Hydrogen ion concentration, Alkalinity, Seasonal, Temperature, Heat budget, Mathematical studies, Hydrology, Water flow, Air temperature, Light penetration, Chemical stratification, Hydrodynamics.
Identifiers: *Slapy Reservoir(Czechoslovakia), Orlik Reservoir(Czechoslovakia), Vltava Cascade(Czechoslovakia).

How basic physical and chemical limnology changes when a primarily isolated high discharge-volume riverine reservoir becomes a lower part of a cascade, and the effect of an upstream reservoir on stratification and horizontal distribution of basic physical and chemical values of the original reservoir (Slapy) in the Vltava Cascade were studied. As derived from direct comparison of two medium discharge years, the shift in time of temperature maxima of the outflowing river is doubled and there is a twofold winter temperature increase in the post-Orlik period. A similar shift of surface seasonal maxima and increase of winter temperatures was observed. Stratification was more pronounced and epilimnium thicker in the post-Orlik years. The S-shaped dissolved oxygen, pH, and alkalinity depth curves resulting from layering of the inflow to intermediate depth changed to regular curves when deep cold water of Orlik fed Slapy. During the years when Orlik was operating the minimum heat content and minimum surface temperatures were linearly positively dependent on the minimum monthly mean air temperature, which in turn is a positive logarithmic function of winter discharges. The complex hydrodynamics of reservoirs is discussed. An empirical thermal model for an isolated reservoir and a reservoir in the cascade is obtained. (See also W74-05068) (Jones-Wisconsin)

CHANGES OF SOME CHEMICAL CONSTITUENTS AND BACTERIAL NUMBERS IN SLAPY RESERVOIR DURING EIGHT YEARS,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
L. Prochazkova, V. Straskrabova, and J. Popovsky.
In: 'Hydrobiological Studies 2,' Academia Publishing House, Prague. 1973. p 83-154. 35 fig, 15 tab, 66 ref.

Descriptors: *Chemical properties, *Bacteria, *Reservoirs, Eutrophication, Phosphorus, Ammonia, Nitrogen, Chemical oxygen demand, Biochemical oxygen demand, Biomass, Organic matter, Primary productivity, Coliforms, Decomposing organic matter, Discharge(Water), Conductivity, Alkalinity, Chlorides.
Identifiers: *Slapy Reservoir(Czechoslovakia), Orlik Reservoir(Czechoslovakia), Vltava River(Bohemia).

Changes that occurred in Slapy Reservoir after filling of the new Orlik Reservoir, located above Slapy on the Vltava River, Czechoslovakia were evaluated together with other external and internal factors on long-term changes in chemical and bacteriological characteristics of the reservoir surface. Nitrate concentration increased steadily with increased nitrogen fertilization in the river drainage area. About 25% of the total nitrogen supplied in fertilizers and atmospheric precipitation entered the reservoir; increase of phosphorus fertilizers had no effect on the total phosphorus in the reservoir. A significant indirect correlation of primary production with ammonia-nitrate concentration was observed. An indirect correlation was found between primary production and phosphate-phosphorus concentration. The N/P ratio increased after the construction of Orlik Reservoir to about 40. The sums of COD, BOD-5 corrected for algal biomass, direct counts on beef-peptone-agar (BPA) 10 days and 5 days coliforms showed a direct significant correlation to mean water discharge. The effect of Orlik Reservoir on decrease of COD and BPA-10 bacteria at the Slapy Reservoir surface was observed at the beginning of the second year after filling of Orlik; on direct bacteria counts from the third year, and on BOD-5 from the fourth year onwards. THE CHANGES IN SEVERAL PARAMETERS OF PLANKTON PRIMARY PRODUCTIVITY IN SLAPY RESERVOIR 1960-1967, THEIR MUTUAL CORRELATIONS AND CORRELATIONS WITH THE MAIN ECOLOGICAL FACTORS,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.

P. Javornicky, and J. Komarkova.
In: 'Hydrobiological Studies 2, 'Academia Publishing House, Prague. 1973. p 155-211. 33 fig, 6 tab, 55 ref.

Descriptors: *Plankton, *Primary productivity, *Reservoirs, Phytoplankton, Photosynthesis, Biomass, Chlorophyll, Algae, Solar radiation, Temperature, Phosphorus, Discharge(Water), Seasonal, Diatoms, Anabaena, Stratification, Cyanophyta, Light penetration, Chlorophyta.
Identifiers: *Slapy Reservoir(Czechoslovakia), Vltava Cascade(Czechoslovakia).

Results of an 8-year study of Slapy Reservoir, Czechoslovakia are given in connection with phytoplankton species, phytoplankton photosynthetic activity relationahip to biomass percentage of main phytoplankter groups, seasonal changes in parameters of plankton primary productivity, seasonal average of these parameters, mutual correlations between these parameters, and correlations between parameters of plankton primary productivity and several ecological factors. Cell volumes of most abundant phytoplankton species are tabulated. Species of algae dominating the phytoplankton biomass in the surface 3-m layer (trophogenic zone) at the standard sampling station during three main periods of the eight seasons of vegetation are listed. Two coefficients of photosynthetic activity of phytoplankton, namely turnover rate in situ and activity in vitro, are considered. Seasonal patterns and their changes during the years investigated are shown and analyzed. The differences between the seasonal averages were tested and the averages as well as the individual data are correlated both mutually and with the following ecological factors: incident solar radiation energy, Secchi disc readings, water temperature, concentration of total phosphorus, and discharge of reservoir water. The last two factors are demonstrated to be the most important for plankton primary productivity in Slapy Reservoir. (See also W74-05068) (Jones-Wisconsin)

THE CHANGES OF BENTHOS IN SLAPY RESERVOIR IN THE YEARS 1960-1961,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
V. Hruska.
In: 'Hydrobiological Studies 2,' Academia Publishing House, Prague. 1973. p 213-247. 10 fig, 10 tab, 62 ref.

Descriptors: *Benthos, *Reservoirs, Temporal distribution, Oligochaetes, Diptera, Tripton, Tubificids, Littoral, Profundal zone, Biomass, Benthic fauna, Organic matter.
Identifiers: *Slapy Reservoir(Czechoslovakia), Orlik Reservoir(Czechoslovakia).

In two consecutive years of benthic observations of Czechoslovakia Slapy Reservoir there were wide differences in organic matter supply brought into the reservoir by the Vltava River. This supply ceased in the second year after upstream Orlik Reservoir became operative. Benthic abundance and biomass were observed at transects 9 km and 33 km above Slapy dam. Additional samples were taken 35 km above the dam. Experiments with four protected bottom areas against fish predation were conducted at the 9 km transect. In 1960, benthos was quantitatively richest in the profundal of both transects. Oligochaeta were most important. In 1961 with the retention of river tripton in the upper Orlik Reservoir the huge quantities of Oligochaeta disappeared from the 33 km transect. he lower profundal became quantitatively the richest zone and changes of abundance and biomass differed from those in the preceeding year. Protection of the bottom areas against fish feeding indicated that differences between the quantitatively poor benthos in the littoral and sublittoral and rich benthos in the profundal must be ascribed to the better food conditions rather than to fish predation. LIMNOLOGY OF TWO RE-REGULATION RESERVOIRS IN CZECHOSLOVAKIA,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
M. Straskraba, and P. Javornicky.
In: 'Hydrobiological Studies 2,' Academia Publishing House, Prague. 1973. p 249-316. 34 fig, 9 tab, 37 ref.

Descriptors: *Limnology, *Reservoirs, *Thermal stratification, *Temperature, Biomass, Temporal distribution, Stratification, Mathematical models, Phytoplankton, Zooplankton, Chlorophyll, Photosynthesis, Standing crops, Hydrology, Oxygen, Hydrogen ion concentration, Alkalinity, Nutrients, Primary productivity, Discharge(Water).
Identifiers: *Re-regulation reservoirs, Vltava Cascade(Czechoslovakia).

Investigations of two re-regulation reservoirs with short retention times, differing in inflowing water, are reported. Analysis was made of seasonal temperatures and an empirical temperature model developed for Czechoslovak Vltava Cascade and primary production in relation to discharges and stratification, and quantitative relation of phyto- and zooplankton studied. During two years of direct study and evaluation of 10-year data, temperature change within the poorly stratified water mass of the re-regulation reservoir was found to correlate with the air-water temperature gradient and retention time. In the re-regulation reservoir receiving a tributary river in addition to the upper reservoir outflow, the temperature changes were correlated with the mixing of the two inflowing water masses. Species composition, abundance and standing crop of phyto- and zooplankton, as well as the chlorophyll-a content and photosynthetic activity of phytoplankton are explained in connection with the phytoplankton origin of the re-regulation reservoir from the depths of the upstream reservoir. Log ratio phytoplankton production/zooplankton standing crop was found to increase logarithmically in reservoirs with renewal times more than 20 days, but to be renewal independent in highly throughflowing reservoirs. (See also W74-05068) (Jones-Wisconsin)
W74-05073

THE INFLUENCE OF TWO RE-REGULATION RESERVOIRS ON THE CHEMICAL AND BACTERIOLOGICAL PROPERTIES OF RIVER WATER,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
V. Straskrabova, L. Prochazkova, and J. Popovsky.
In: 'Hydrobiological Studies 2,' Academia Publishing House, Prague. 1973. p 317-348. 10 fig, 14 tab, 21 ref.

Descriptors: *Reservoirs, *Chemical properties, *Bacteria, *Rivers, Hardness(Water), Coliforms, Phosphates, Chemical oxygen demand, Biochemical oxygen demand, Phosphorus, Nitrogen, Conductivity, Discharge(Water), Tributaries, Primary productivity, Retention, Nitrates, Ammonia.
Identifiers: *Re-regulation reservoirs, Vrane Reservoir(Czechoslovakia), Slapy Reservoir(Czechoslovakia), Stechovice Reservoir(Czechoslovakia), Vltava River(Czechoslovakia), Sazava River(Czechoslovakia), Vltava Cascade(Czechoslovakia).

Whether the chemical or bacteriological composition of river water is changed after passage through a reservoir with short retention time (several hours to several days) and whether some features characteristic of static waters develop in such reservoirs were investigated. Of the two reservoirs on the Vltava River above Prague, a segment of the Vltava Cascade, Stechovice is supplied by outflow of Slapy Reservoir and Vrane is filled by the Vltava River flowing from Stechovice and by tributary Sazava River. Only significant changes found in the water after passage through Stechovice Reservoir were increases in total hardness, organic nitrogen, and coliform bacteria, and decreases in phosphate-phosphorus, COD and BOD-5. Water passing through Vrane Reservoir showed a significant decrease in COD during low discharge only and an increase in total phosphorus and phosphate-phosphorus, organic nitrogen, specific conductivity, BOD-5, and in numbers of bacterial groups. Bacterial numbers showed an indirect proportion to Vlt ava River discharge. Difference between the BOD-5 concentration in outflow and inflow of Stechovice Reservoir correlated directly with retention time. Difference in ammonia nitrogen concentration in the outflow and inflow of Vrane Reservoir correlated indirectly with primary production of phytoplankton and directly with both discharge of Sazava River and the percentage in the total reservoir discharge. RESEARCH TO DETERMINE THE ENVIRONMENTAL RESPONSE TO THE DEPOSITION OF SPOIL ON SALT MARSHES USING DIKED, AND UNDIKED TECHNIQUES--FIRST ANNUAL PROGRESS REPORT,
Skidaway Inst. of Oceanography, Savannah, Ga.
H. L. Windom, and R. R. Stickney.
Available from the National Technical Information Service as AD-757 717 $6.00 paper copy, $1.45 in microfiche. Army Engineer District, Savannah, Georgia, Report April 1972. 373 p, 170 fig, 49 tab, 16 ref.

Descriptors: *Environmental effects, *Dredging, *Salt marshes, *Dikes, *Spoil banks, Deposition(Sediments), Water quality, Sediments, Biota, Georgia, Coasts, Metals, Estuaries, Aquatic plants, Benthos, Periphyton, Computer programs, Trace elements, Oxidation-reduction potential, Hydrogen ion concentration, Sulfides, Invertebrates, Mathematical studies.
Identifiers: Spartina alterniflora, Diversity indices, Intracoastal waterways, Savannah River(Ga.), Hell Gate(Ga.), Thunderbolt(Ga.).

Nature and magnitude of environmental changes resulting from dredging activities in salt marsh-estuarine environments of the southeastern Atlantic coast are evaluated. Water quality changes where diked and undiked techniques were used, salt marsh sediment responses to deposition of dredged material, and changes in biota were studied where dredging took place. It is concluded that in natural and relatively unpollutted areas dredging has no significant effect on water quality where either diked or undiked techniques were used; in polluted areas, water quality impairment caused by dredging does not necessarily bear any simple relation to composition of sediment to be dredged. Since distribution of trace metals (micronutrients) in various valence states in marsh sediments has a characteristic distribution pattern with depth dependent on Eh, pH, and sulfide, changes occurring in the latter parameters during spoil material deposition can greatly affect distribution of the former. Combination of reduced sediments and micronutrients may be important to the healthy maintenance of the salt marsh plant, Spartina alterniflora. Analyses of data indicate that no effects of dredging on the fishes and macroinvertebrate fauna within the 1971 dredge areas along the Intracoastal Water Ways of Georgia could be delimited. HISTOCHEMICAL AND CYTOPHOTOMETRIC ASSAY OF ACID STRESS IN FRESHWATER FISH.
Pennsylvania State Univ., University Park. Dept. of Biology.
Copy available from GPO Sup Doc as EP1.16:18050OXJ05/4, $1.25; microfiche from NTIS as PB-227 571, $1.45. Environmental Protection Agency, Water Pollution Control Research Series, May 1971. 113 p, 32 fig, 18 tab, 66 ref. EPA Grant No. 18050DXJ.

Descriptors: Fish physiology, *Bioassay, *Acidic water, Water pollution effects, Pennsylvania, Analytical techniques, Microscopy, Bioindicators, Toxins, *Brook trout, Minnows, Spectrophotometry, Spectroscopy, *Fish pathology.
Identifiers: *Fish histochemistry, Analytical histochemistry, Cytophotometry, *Longnose dace, *Fathead minnows, *Acid toxicants.

The feasibility of using histochemical and histopathological changes in brook trout, longnose dace and fathead minnows as bioindicators of acid pollution was investigated. Laboratory studies entailed using a gravity flow diluter system. Field studies involved using net traps in polluted streams. Exposure durations were 4-5 days and 28-30 days. Histochemical cytophotometric analyses were made of gills, Stannius corpuscle, blood, spleen, kidney and liver. The primary mode of acid toxicant action is gill damage which results in impaired respiratory, excretory and liver functions. Short term indices of acid stress include: colloidal iron and PAS staining of gills and renal Stannius corpuscles. A useful bioindicator of prolonged acid exposure is decreased azure B-RNA staining of liver cells; this assesses the extent of liver impairment and reflects of reduced tolerance of fish to other toxicants. Sublethal levels of acidity are not cumulative. However, pH levels of about 5.0 should be considered hazardous since they prove toxic to breeding fish having increased oxygen needs and also reduce the liver's ability to detoxify noxious substances present in acid polluted waters. THE OXYGEN UPTAKE DEMAND OF RESUSPENDED BOTTOM SEDIMENTS.
Seattle Univ., Wash. Dept. of Civil Engineering.
Copy available from GPO Sup Doc as EP1.16:16070DCD09/70, $0.50; microfiche from NTIS as PB-228 263, $1.45. Environmental Protection Agency, Water Pollution Control Research Series, September 1970. 38 p, 11 fig, 6 tab, 15 ref. EPA Project 16070 DCD, Contract 14-12-481.

Descriptors: *Biochemical oxygen demand, *Bottom sediments, *Sludge, Sodium chloride, Salts, Light, Estuaries, Temperature, *Washington, Dissolved oxygen.
Identifiers: *Warburg respirometer, *Bellingham Bay(Wash), *Benthic sludge.

A laboratory study has been conducted to show the application of the Warburg respirometer in evaluating the influence of light, sodium chloride, dilution salts, temperature and agitation on the maximu oxygen uptake rate of disturbed bottom sediments. Experiments were conducted on estuarian benthic material obtained from Bellingham Bay, Washington. In all experiments the initial oxygen uptake rate was the maximum uptake rate. Results obtained using distilled water as the suspending medium were not appreciably altered due to the addition of BOD dilution salts, or sodium chloride in concentrations less than 30,000 mg/l. The initial uptake rate also appears to be insensitive to light. Ambient temperatures were varied from 10C to 20C and agitation settings were varied from instrument maximum to twenty-five percent of maximum. The Squalicum Creek sample showed variations in initial uptake from 2,000 to 57,000 mg/l of oxygen per hour. The Whatcom Creek sample had a range from 2800 to 83,000 mg/l of oxygen per hour. Results indicate that the maximum uptake rate is very sensitive to temperature, degree of disturbance, and the total volatile solids concentration of the benthic material. Agitation alone was shown to account for at least a ten fold increase in the maximum oxygen demand. (EPA)

THE BIOLOGICAL PATHWAY OF ZINC (ZN-65) IN FRESHWATER FISH AND ITS ALTERATION BY HEAVY METALS,
European Atomic Energy Community, Ispra (Italy). Biology Div.
M. Merlini, F. Argentesi, A. Brazzelli, B. Oregioni, and A. Berg.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 285-306, (1971), 7 fig, 7 tab, 24 ref.

Descriptors: Water pollution, Fish, Absorption, *Zonc, *Toxicity, *Public health, *Radioactivity, Food chains, Ecosystems, Lakes, Radioecology, Biological properties, Path of pollutants, Microbiology, Aquatic microbiology, Mercury, Cadmium, Heavy metals, *Sunfishes.
Identifiers: *Italy(Lake Maggiore).

The biological pathway of Zn-65 was studied in the freshwater fish Lepomis gibbosus, L. from Lago Maggiore (Lake Maggiore) in Northern Italy under different experimental conditions. The results showed that the biological half-times of accumulation (Tba) and the rates of accumulation (k) of radiozinc from water by fish fed rations with 16 ppm of stable zinc and for fish fed a zinc-free diet were significantly different. In the first case, the Tba was 97 days and k was equal to 0.007 per day; whereas in the second case, for fish on a zinc-free diet, the Tba was 27 days and the rate of accumulation was 0.027 per day. Fish without stable zinc in their diet accumulate their body burden at a faster rate than those with zinc in their diet. In addition, fish fed zinc-free ration accumulated significantly more radiozinc than those on a normal diet. Uptake data and bio-elimination half-times for Zn-65 absorbed from water by the fish are given in detail. From the investigations performed it was ascertained that zinc, an essential micronutrient, is homeostatically controlled by fish and that low levels of pollutants such as mercury and cadmium did not affect the total stable Zn content of the animal within the time limits studied. These metals do, however, inhibit the uptake of zinc as Zn-65 and the concentration of the nuclide. (See also W74-05181) (Houser-ORNL)

CYCLING OF ZINC-65 IN A SIMPLE FOOD WEB,
Battelle-Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.
C. E. Cushing, and D. G. Watson.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 318-322, (1971), 4 fig, 1 tab, 8 ref.

Descriptors: Cycles, *Zinc, *Water pollution sources, Fish, *Carp, *Food webs, Research and development, Model studies, *Columbia River, Radioactivity, Water pollution, Absorption, Measurement, Equilibrium, Retention.

Experiment was designed to investigate the cycling of Zn-65 in a simple water-periphyton-fish food web under constant flow, light, and ambient radionuclide concentration. Water temperature followed the seasonal pattern of the Columbia River. Replicate experimental streams containing periphyton and young carp (Cyprinus carpio) were spiked continuously to maintain Zn-65 concentrations of approximately 1 and 10 pCi/ml - about 20 and 200 times that of the river water. Periphyton and fish were sampled at intervals to ascertain the time necessary to reach equilibrium. Subsequently, the spike was cut off and retention of the Zn-65 was followed. Concentrations of Zn-65 in periphyton approached equilibrium in about 28 days at levels of 17 and 90 nCi/g wet weight in the low- and high-level streams respectively. These represent concentrations of about 23 and 150 times that of the control periphyton and are very close to the differential spike levels in the water. This means that, under the conditions of this experiment, periphyton concentrates Zn-65 in nearly direct proportion to ambient concentrations. The specific activity of the periphyton at equilibrium was 35 and 210 pCi/mg in the low- and high-level streams respectively. The estimated effective half-life was about 15 days. Data on the fish were more variable due to the influence of temperature on metabolic rates. Approximate equilibrium was reached in about 43 days at concentrations of 0.25

and 1.3 nCi/g wet weight in the low- and high-level streams respectively. This represents concentrations of 6 and 29 times that of the control fish. Specific activities at this time were 3 and 20 pCi/mg. These data suggest that true equilibrium in the carp had not been reached. Water temperatures varied from 6 to 18C during the experiment, which ran from January to June. (See also W74-05181) (Houser-ORNL)

THE FATE OF COBALT-60 IN A NATURAL FRESHWATER ECOSYSTEM,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Chalk River Nuclear Labs.
I. L. Ophel, and C. D. Fraser.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 323-327, (1971) 1 fig, 4 tab, 11 ref.

Descriptors: *Cobalt, *Ecosystem, Freshwater, *Lakes, *Dystrophy, *Eutrophication, Water pollution, Water pollution effects, Assay, Measurement, Radioactivity, Aquatic plants, Fish, Biota, Absorption, Lake morphology, Distribution, Sediments.
Identifiers: *Canada(Perch Lake).

Perch Lake is a small dystrophic-eutrophic lake on the property of Atomic Energy of Canada Limited at Chalk River, Ontario. For seven years it has been receiving at a relatively constant rate small amounts of Co-60 via its inlet stream, resulting in low, but measurable, concentrations of this radionuclide in the lake water. During this time water and food-chain components have been assayed for Co-60 content using a large-volume counter combined with a single-channel gamma-ray spectrometer. Concentration factors were determined for the dominant species of aquatic plants, fish, and other biota. Large differences in accumulation were found between species of plants due to morphology of the plants and their location in the lake. Differences between fish species are correlated with their feeding habits. The vertical and horizontal distribution of radiocobalt in the bottom sediments was investigated. Most of the nuclide is confined to the upper few centimeters of the organic-rich deposits. Calculations indicate that the lake sediment is an important storehouse of cobalt and that approximately 30% of the Co-60 that has entered the lake is now resident on the bottom. W74-05203

ECOLOGICAL FACTORS AFFECTING THE ACCUMULATION OF CESIUM-137 FALLOUT BY A NATURAL POPULATION OF LARGEMOUTH BASS, (MICROPTERUS SALMOIDES),
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
S. A. Spigarelli.
In: CONF-710501-P1 - Proceedings of the Third National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tenn. p 328-333, (1971) 2 fig, 4 tab, 19 ref.

Descriptors: *Cesium, *Fallout, *Ecology, Population, *Largemouth bass, Radioactivity, Absorption, Assay, Measurement, Compatibility, Lakes, Michigan, Speciation, Correlation analysis, *Michigan.
Identifiers: *Wintergreen Lake(Mich).

In order to better define the variable accumulations of Cs-137 fallout by the individuals of a fish population, the effects of selected ecological parameters were tested. Individual fish characteristics (sex and weight), monthly precipitation, and time of year were statistically analyzed for their influence on Cs-137 activities of largemouth bass collected from Wintergreen Lake, Kalamazoo County, Michigan. Monthly collections of bass were analyzed for Cs-137 activity. No significant difference in Cs-137 activity was detected between male and female bass of equal size. However, body weight was a significant factor; larger bass accumulated more Cs-137 and total Cs per unit weight than small bass. The plots of Cs-137 vs weight and total Cs vs weight were very similar and supported the specific activity concept. The relationship between weight and Cs-137 in bass was estimated to be curvilinear with positive slope up to approximately 1000 g and negative slope above 1100 g. Mean Cs-137 activities of bass collected monthly from May to October 1969 were significantly different. The maximum activities occurred during May, the minimum in August. No correlation was demonstrated between monthly precipitation levels and Cs-137 activities of bass. (See also W74-05181) (Houser-ORNL)
